ecting rod; 10 per cent. in short end rank pin; increased oil space in base; e absolutely dust proof and self-lubri-ng; transmission and driving sprocket be removed without effecting adjust-ts of the motor; by use of the Thor ger the power chain and pedalling n can be adjusted independently.

Thor Spring Fork.

ne Thor spring fork is not an attach-t to a fork but a complete fork in it-It consists of a one-piece stem and r connection with triple keyed top ection. Four levers connect the fork of the frame with the parallel ex-ing fork sides, making eight connect-points which are of ample size and bearing. These can be screwed up lly, eliminating wear and adjustment frequent oiling. The levers forming

safety device in particularly severe re coils. This cylinder, arranged for absorb ing the shock, is hinged diagonally on th head and fork bearings and can be de tached without taking the work apart This construction of the fork being for ward from the head allows the controllin mechanism to be carried from the cente of the head.

"Delaware" Shaft Driven Motorcycl

W. J. Grube, a mechanical engineer, wh has been connected with the motor ca trade in various capacities for some years and has designed and marketed both en gines and complete cars, has lately turne his attention to motor cycles, and for year past has been thoroly trying out hi finally adopted design. This motor cycl is called the "Delaware," and is made b Grube Motor Co., of Delaware, Ohio, o which Mr. Grube is general manager, A. J Willey is president and S. S. Blair, secre tary-treasurer.

Some of the unusual features of thi machine are noticeable at a glance, suc as the shaft drive and the peculiar moto suspension. Drive from the motor to th shaft is thru a multiple disk clutch whic is controlled from the right handle ba by means of a lever similar to the brak levers on the early types of pedal cycles The clutch allows a free motor for eas starting and gives a ready and efficien means of keeping the speed of the machin under absolute control, a great advantag in crowded thorofares.

steel 1-16-inch thick (alternate disks hardened) assembled inside of the large half-time gear which is cupped out for the purpose. Six of the plates are driven from four studs set in the gear wheel, the alternate disks have square central holes fitting squared clutch shaft. The small bevel gear drive pinion is cut integral with the drive shaft, which is driven at its forward end with right and left-hand threaded square nuts which connect with a squared hole sleeve to the clutch shaft. This arrangement absolutely prevents the nuts from working loose and allows of a little give and take in the drive shaft mechanism. It also allows of the motor and accessories, which are entirely self-contained, to be removed, which can be done in a few minutes without in any way disturbing the drive shaft. The clutch is held in engagement with a brass follower plate and four coiled springs which fit the previously mentioned studs that drive the discs. The drive mechanism throughout is by squared shafts and integral cut gears, rendering derangement of these parts practically impossible. This arrangement makes the drive exceedingly simple, as all the mechanism necessary in addition to the regular engine is the shaft and pair of bevel gears. End thrust both of clutch and gears is taken by ball thrust bearings of improved type. The motor is 3 H. P. and of the 4-cycle type; bore and stroke each 3 inches. The crank shaft is of forged steel with counterweights integral. The crank shaft is mounted on F. S. annular ball bearings. The cylinder is turned inside and out, giving a uniform cylinder wall. Cylinder and piston are ground and lapt. Both valves are mechanically operated. Carburetor is of the usual spray type, but is not fitted with float feed chamber. Instead it has a very simple pump and overflow system which keeps the gasoline at a constant level. This is an important improvement, for by eliminating flooding of the carburetor overheating of the motor is avoided. This arrangement is also economical, as no fuel is ever wasted. The frame is made of 14-gage tubing strongly reinforced at frame connections. The wheel base is 56-inch; wheels are 28-inch, fitted with G & J two-piece rims, any make of tire being supplied. The front fork is of the suspension type. The lower fork reaches entirely around the wheel from one axle tip to the other, to prevent the wheel from wobbling when rounding corners. A rubber-damped rod passes thru the spring and spring support, and serves to make fork safe in case the supporting springs should break. The crank hanger and pedals, which are used only for starting, are clamped to the lower rear stays and can be readily removed and comfortable running boards fitted for the feet, as the motor can be easily started before mounting. The oil, gasoline batteries and coil are all carried in one neat case. The case also encloses all wiring with the exception of one wire to the timer. The long wheel base and exceedingly easy front fork, together with long handle bar and large soft rubber grips, give very easy riding, and when running boards are fitted the effect is practically that of a car on two wheels as far as comfort is concerned, but a bicycle as regards up-keep expense. The price is $215.00 with battery ignition or $250.00 with magneto.

1908 Model, The Delaware Motorcycle, direct shaft drive, with multiple disk clutch giving a free engine. Note sensible exhaust pipe and large muffler which effectually silences the exhaust.

If you send us $2 before February 1, you can save $2 by doing so. That is we will credit you with two year's subscription for the price of one.

as Auto-Bi Company which formerly the machine has been succeeded by Auto-Bi Co., and the new factory is ed at 1573-1575 Niagara street, Buffalo,

o models are offered for 1908, both ame mechanically but having different ments to meet the requirements of ifferent classes of customers. Some mers want the very best tires, saddles, and for this class the Auto-Bi Co., Model 47, which has 2½-inch G & J er tires, hollow, nickeled steel rims, ns double coil spring motor seat, or s motor saddle, extra high handle corrugated extra wide mud guards

The Ovington Motor Co., 2208 Broadway, New York City, N. Y., agent for the four-cylinder F. N. motorcycle of Holland, are now prepared to fit fore cars to these machines. The fore car is a device by means of which the motorcycle may be transferred into a three-wheel two-passenger vehicle, one passenger being placed in front of the other. It is different from a side car in that the extra passenger attachment is placed in front of the driver who sits on the motorcycle seat instead of beside him as in the case of the side car. The fore car is not new in this country, but the type of fore car illustrated has several distinctive features. The bracing

The finished of the motor are nickeled, which not dds to its appearance but gives a surface easily kept clean and not ly to gather and retain dirt. A foot- ed muffler cut-out is fitted, and a g cock is provided to give easy g with a cold motor. The timer is ed on the new model. The cushion

is different than that of any American machine, the frame work running from the extreme rear to the front. In the matter of brakes this fore car is not depdendent on a small motorcyle brake in the rear hub of the motorcycle itself, but is fitted with a powerful expanding drum brake in place of the hub brake, and in addition with two band brakes, one being on each wheel of the fore car. In other words, every wheel on the vehicle is fitted with a powerful brake, any one of which would be sufficient to stop it under all ordinary circumstances. The rear brake is applied as is customary by a back pedaling action, and the band brakes on the fore car by means of a special pedal placed on the fore carriage frame work in proximity to the feet of the rider. The machine is also fitted with liberal sized automobile type mud guards instead of bicycle guards, as

A side car is also made by the F. N. Company which overcomes the usual difficulty experienced in steering this type of vehicle owing to the third wheel rotating in one place only, as the F. N. third wheel is of the castor type, and supported on ball bearings, being free to swing into any plane in a vertical axis.

THE NEW SINGLE CYLINDER F. N. MOTOR CYCLE.

A new single cylinder machine has been placed on the market this year. One of its novel features is the transmission, which is a combination of a gear and belt drive. It is usually necessary to make the driving pulley on the engine as small as possible, and the pulley on the rear wheel as large as the construction will allow in order to obtain the required gear reduction. The small engine pulley means that the driving belt has very little surface or grip, and the large pulley is liable to strike road obstructions. The F. N. Company has mastered this difficulty by employing a geared pulley. This is an enlarged type of the ordinary pulley, but in the interior, gear teeth are cut, and a pinion on the engine meshes with this gear. As the gear reduction is made in the geared pulley itself, this construction allows the use of a very large engine pulley and a comparatively small rear pulley, and it is claimed belt slipping is entirely overcome. This device also forms a ready means of tightening the belt. This little machine weighs complete only 100 pounds, which, when it is considered that this includes a Simms-Bosch high tension magneto and a spring fork, is remarkably light; in fact, the machine is one of the lightest in the country.

THE F. N. BIG FOUR MOTOR CYCLE.

The four-cylinder F. N. motorcycle remains practically unchanged. However, a heavier type of Simms-Bosch magneto is employed, a different design of muffler is used, and the rear mud guard has been made more readily removable.

The price of the F. N. single cylinder motorcycle has just been reduced from $250 to $215, and this includes a Simms-Bosch magneto, which sells alone for $42.50, the spring forks, combined gear and belt drive, and other valuable 1908 features. The Ovington Motor Company also now handle the Nala Hub, a two-speed gear and free engine device, the price of which is $68.50. It is especially adaptable to use with twin cylinders or large single cylinder motors, and for tricar use. Another new feature of the F. N. line is a 6 H. P., 4-cylinder motorcycle for racing purposes. The engine has mechanical valves, and is fitted on a light weight racing frame.

Imperial Motorcycle Mfg. Co., of Brazil, Ind., has under way a two-cylinder motorcycle which will be equipt with magneto and two-speed gear and will employ shaft drive.

Sager Spring Fork for Indian Motorcycles

J. Harry Sager, Rochester, N. Y., has put out for 1908 a new type of the Sager spring fork, especially designed for use on Indian motorcycles which was given marked attention at the New York and Chicago shows. The difference between this model and the standard Sager fork is

Sager Spring Fork for Indian Motorcycles.

chiefly in the new attaching device made necessary by the fact that the Indian fork is swiveled at a point near the crown. As the drawing herewith tells the whole story, extended description is not necessary. A number of motorcycle manufacturers are using Sager spring forks as regular equipment on their 1908 machines.

The "Loring" Motorcycle Speed Gage

The Loring Speed Gage, marketed by the Loring Auto Appliance Co., 49 W. 63d street, corner Broadway, New York City, and described in our November, 1907, issue, page 205, and in the December, 1907, issue, page 164, is now made in a smaller size for motorcycle use.

The "Loring" Motorcycle Speed Gage as applied to a Motorcycle.

The accompanying cut suggests the manner in which the gage is applied to a motorcycle. The drive is by bevel gears. The internal construction of the motorcycle gage is exactly the same as the regular automobile size, except that its parts are proportionately smaller.

M. M. FOR 1908

THE BEST MOTOR CYCLE BUILT. Not what we say, but what the Riders say. YOU WOULD SAY SO, TOO, if you could only ride the M. M. Special for 1908, with its 3½ H. P. smooth running engine, equipped with 26" wheels, nickeled rims, special constructed frame dropped at seat post joint to admit of a perfect seat position, at the same time giving you a longer wheel base, thereby a better balanced Machine. Add to this an ideal Motor Cycle front spring fork, so perfectly constructed and adjusted as to absorb all road jars, while the engine is so placed in frame as to get the best possible results with the least possible vibration, and you get some idea of the splendid M. M. for 1908.

Also equipped with the new M. M. Motor Cycle Stand, newly designed cylinder and cylinder head. Also new priming device, new chain idler device, together with long rear adjusting jaws admitting of the taking up of any and all slack that might appear in the belt, thereby adding efficiency to the belt transmission.

These are only a few of the new features on the M. M. for 1908.

Write for details and our interesting proposition.

e December number. In the "R. S." g fork one larger spring has sup- ed the two formerly used. The fork has been strengthened and the head gs also. A direct drive machine is of the features of the "R. S." 1908

e of the points to which attention is d is the fact that the motor can be d centrally in the frame and not to side and yet the proper chain line is ned as well as perfect balance. The are placed separately from the r base in an oil proof case, thus d breakage occur, no damage will one to the motor parts themselves. oil proof case is not only of neat and eful appearance, but the construc- makes this machine such a clean one it is said that protection such as leg- is not necessary to keep the rider's es clean. The frame of this machine so specially designed with a view to netry.

1908 New Departure Motorcycle Coaster Brake

refining the New Departure Motor- Coaster Brake for 1908, the maker, Departure Manufacturing Co., New ol, Conn., has incorporated in it such ovements as are calculated to make ronger and more certain in action ut sacrificing its well known charac- ics and simplicity.

1908 New Departure Coaster Brake for Motor Cycles.

e new model is made in two lengths all for belt drive, namely, 5⅝ inches ⅛ inches (from outside to outside of washers), and 5⅛ inches over all for drive. These measurements adapt rake for use in the new 1908 motor- . For the chain drive a very import-

improvement is that of making it un necessary to remove the wheel from the frame to change or repair spokes. No special tools are required to remove the lock ring or sprocket. Another advantage is the avoidance of stripping threads.

The keyed sprocket becomes practically a part of the hub itself, and is rigid, strong and reliable.

At the recent Madison Square Garden Show, the New Departure Annular Two-in-One Ball Bearing was a feature which attracted a great deal of attention among motorcycle manufacturers, with the result that it is being adopted by many of the largest manufacturers for their 1908 models.

Construction, Management and Care of Motor Cycles

E. W. Keller has written a practical little book under the above title, which is published by Advance Sales Co., American National Bank Building, St. Paul Minn. The book is of convenient size to fit the coat pocket, contains about 45 pages of descriptive and explanatory matter, and is illustrated by several full-page drawings which are simple and clear. The price is 25 cents. The information contained in this book is all presented in non-technical language, which can be understood by any novice.

Answers to Motor Cycle Queries

FOREIGN Vs. AMERICAN MACHINES

15 Pierrepont St., Brooklyn, N. Y.

May I trouble you to answer the following questions:

1. How many makes of N. S. U. Motorcycles are there? In your motorcycle review you gave the N. S. U. as being made by the Leader Specialty Co., of Bradford, Pa. In the advertisement it speaks of it being "Englands best" and is imported by J. T. McLaughlin, of New York. The pictures in the advertisement and that in the review look very similar. The review gives only one-cylinder model and gives it as 3½ horse power at $205. The advertisement gives it as 2½ horse power at $225. In your March "Answers to motorcycle queries," a correspondent speaks of the N. S. U. as German.

2. Do all motorcycles that have magnetos use no coil? Why do they use a spark plug, jump spark ignition or a make and break.

3. Are foreign motorcycles considered better than American built machines?

4. What is the fastest speed made by a motorcycle? By whom? By what machine? When? Where?

5. Is a motor hung vertically better than one hung slightly inclined? If so, why?

6. How are motorcycle two speed and clutch affected?

7. What are the position of cranks on a two-cylinder motor?

8. Is not a movable Idler used as a clutch a good thing? If not, why? An example is the "Geer."

9. Is magneto ignition preferable to a battery? Is it more trouble? Is it simpler?

10. How much horse power is needed to have a motorcycle take any reasonable hill at 40 M. P. H.?

11. Are there any three-cylinder motorcycles.

12. Which is the simpler and most efficient a suction or mechanical valve?

I read your journal well each month, and I am especially interested in the queries. Hope this department may increase.—K. W. H.

The N. S. U. is made in Germany. There are several models, three single cylinder machines of 331-402-454 cubic centimeters capacity, or 3-3¼-3¾ H. P. respectively. A twin cylinder of 662 cu. centimeters capacity or 5 H. P., but as to price on the American Market I would refer you to the importers. A coil is necessary with jump spark ignition. Some magnetos have a separate coil, others have the coil in conjunction with the armature. The make and break system of wipe spark when used with magneto requires a coil.

Foreign machines are considered by some to be superior to the American made, and that claim has some merit inasmuch as the foreigners seem to have placed the industry on a more substantial basis than we. At the same time foreign machines are made to meet the demands of foreign roads and conditions, which may be very much at variance with our own.

I recall a conversation had with an Englishman in the push bicycle days, after explaining the merits of the rim brakes, the steel rim and other foreign innovations, he picked up his bike exclaiming with great pride, "eft hit, eft hit see ow solid hit is," and so it was, it tipped the scale at 45, when an American rider would not think of pushing more than 25 pounds.

In the manner of control, simplicity and neatness from an American point of view, the foreigner does not have any advantage I believe that we will be sending the American motorcycle into the European market just as we did the push bicycles, before the industry is many years older.

I understand that Wray, of your city on a Simplex has ridden a mile officially in 38 seconds, this is the fastest that I know of. A movable belt idler of a proper design may be used very successfully as a clutch. There should be a rack or other suitable means for holding the idler to the proper tension on the belt. The idler pulley should be of a generous size mounted on substantial ball bearings.

Magneto ignition is preferable to the battery when one has the price and the assurance that it will not go wrong. One cannot be absolutely stalled for the want of a battery for these are procurable almost anywhere, but when a magneto refuses to spark an expert may be many miles away. I recall a particular instance where a rider who had come several thousand miles to enter an endurance contest, was obliged to abandon the run in the first stages owing to the failure of his magneto, however, I am satisfied that the battery will have to be discarded in time, but while watching development the battery at 75c per 1000 miles is not such a bad proposition.

A machine of 3½ H. P. can be geared to travel at the rate of 40 miles per hour on good level roads, and with a 150 pound rider climb a gradient of about 12 per cent, without assistance from the pedals. I do not know of any 3-cylinder motorcycles. A suction valve is simpler, but a mechanical valve is said to give greater efficiency. I have never seen a reliable report on a comparative test, and believe that the gain in power is only slight.—C. E. D.

WHAT IS THREE HORSE POWER?

I am a motorcycle rider and a constant reader of the Journal. My machine is rated three horse power, and I can climb almost any hill in this locality (and we have some very steep ones), but there is one which sticks me, as it does every thing else propelled by motor that has ever attempted it. I admit it is a tough one, but what I cannot understand is this: The machine and my weight combined is something over 300 pounds. I have been over this same hill in a wagon pulled by a horse, the wagon alone weighed more than the combined weight of myself and motor.

How do you account for the fact that one real horse can do more than three mechanically rated horses? Does a horse power in any way mean the capacity of one horse; if so, what do you reckon as a basis for what a horse can do?—E. A. R.

The horse power is reckoned as 33,000 foot pounds, which is the product of weight in pounds lifted by velocity in feet per minute; thus, if a motor putting out its normal work can lift a weight of 100 pounds 330 feet in one minute, it would be rated one horse power delivered. This same motor could be geared to lift 10 pounds 3300 feet in one minute or 3300 pounds 10 feet in one minute. Multiply the weight in pounds by the distance raised in feet per minute, and divide the product by 33,000, and you have the horse power.

The reason a motorcycle will be stalled on a hill is because the gear is too high, for the motor must run at a certain rate of speed in order to develop its full capacity. The manufacturer usually gears the machine in such a way that it will have a fair speed on the level and still have sufficient hill-climbing capacity for overcoming most any hill. I take it the hill you refer to is a very unusual one.

There is a tendency now toward a variable speed transmission for motorcycles which will enable the rider to use a very high gear for level roads, and a low gear for hill-

Yale-California MOTOR CYCLE

"A MOTOR CYCLE IN EVERY SENSE OF THE WORD"

A card will bring our catalogue and agents' proposition. Better learn what Consolidated service means.

The Consolidated Manufacturing Co.
TOLEDO, OHIO

ANNOUNCEMENT

—OF—

The No. 3 Standard Motorcycle Pedal

No. 3 Standard Motor Cycle Pedal

A STRIKING DEPARTURE IN DESIGN AND CONSTRUCTION

Note the excellent lines and proportions.

Special Features:—Large bearings, same size on both ends, insuring perfect running qualities; balls 5/32″ diameter; axles ¾″ stock; broad rubber tread deeply corrugated, giving firm foothold—foot cannot slip.

Let Us Send You Full Particulars.

Hosted by Google

climbing. Such an arrangement, of course, adds to the expense and complication of the machine. Something cheap, simple and effective is what is desired.

A horse by reason of its peculiar anatomy can adapt itself to put forth its best energy at varying speeds, and this is what enables it to pull a load up a hill that would stall a motor of several times the power of the horse, but its ultimate average work is very close to the standard of 33,000 foot pounds, as this rating was based on the work of an average dray horse working steadily thru a considerable period of time. A motorcycle can travel fifty to fifty-five miles per hour and keep it up indefinitely, while the limit of a horse is not more than fifteen if kept at it steadily. This proves that the rating is somewhere near in proportion to ultima capacity with the proper gear ratio.

A man can do work with the aid of levers that would stall a horse. For instance, a horse cannot raise a building if hitched directly to it, but it is an easy task for a man with a jack screw, and that is only another way of reducing the gear. The legs of a horse act as levers, which can be applied thru a limited variable degree of pressure, and this enables it to pull a heavy load at a low rate of speed, and a light load at a high rate of speed.—C. H. M.

COMPRESSION LEAK HARD TO FIND.

Chicago, Ill.

My cyclemotor is three horse power. When you turn it over it seems like it leaks somewhere around the cylinder head. We ground both valves sufficiently, and put a gasket around the spark plug, but it leaks yet somewhere.—H. L. WOOD.

If there are no defects in the casting of the combustion chamber, such as a crack, sand hole, or blow hole, then the leak must be in some joint, or past the piston rings, as you say you have ground the valves properly, and put a gasket around spark plug. To detect a leaky joint apply soapy water around the joints, turn the motor on the compression and bubbles will develop at the leak. Cylinders will some times warp out of round, in which case it is impossible to make the rings hold the compression. The remedy for this is to have the cylinder reground.—C. H. M.

MOTORCYCLES WITH CLUTCHES.

Can you inform me thru your motorcycle department regarding any makers of motorcycles with a clutch and starting crank, or any makers of motor tricycles with package carrier in front and clutch to allow of independent starting of motor?—ARTHUR L. TABER.

The only device now of American make on the market is the Lang two speed gear which is applied to the Harley-Davidson. Quite a number of foreign made machines have two speed devices on tri-cars, both delivery and passenger. The N. S. U. has such device in both single and tri-car models. Imported by J. F. McLaughlin, 148 East Forty-ninth street, New York City, N. Y.—C. H. M.

(Note.—The "Delaware" motorcycle, just placed on the market by Grube Motor Co., Delaware, O., is fitted with a multiple disk clutch allowing a free engine, which we presume is started by turning the exposed flywheel.—Ed.)

Providence Motorcycle Club's Hill Climb

B. A. Swenson, riding a 3 h.p. Indian motorcycle, won two of the three events in which he started in the Providence Motorcycle Club's hill climbing contest on Stump Hill, Pawtucket, R. I., on Thanksgiving Day. The record of 60 3-5 seconds made over this half-mile course last year by L. F. Baldwin with a 20 h.p. steam automobile, was broken no less than fourteen times during the day.

The following is part of the summary, only showing those who covered the course in less than 60 3-5 seconds.

For motorcycles not exceeding 20 cubic inches piston displacement.

	Time.
E. L. Buffington, 1¾ h.p. Indian	0.50
F. Wilkinson, 2¼ h.p. Indian	0.52

For motorcycles not exceeding 30½ cubic inches piston displacement.

B. A. Swenson, 3 h.p. Indian	0.42
J. McLaughlin, 3 h.p. Merkel	0.51
E. L. Buffington, 1¾ h.p. Indian	0.51 1-5
F. Wilkinson, 2¼ h.p. Indian	0.53 4-5

For belt-driven machines, not exceeding 3 horse-power.

J. McLaughlin, 3 h.p. Merkel	0.55

Free-for-all, restricted to Rhode Island riders.

B. A. Swenson, 4 h.p. Indian	0.44
F. E. Domina, 3¼ h.p. Domina	0.45 2-5
F. Wilkinson, 2¼ h.p. Indian	0.51 4-5
D. V. Reiley, 2¼ h.p. Indian	0.57
E. L. Buffington, 1¾ h.p. Indian	0.58 2-5

Growing use of Motor and Pedal Cycles by Police Departments

This is an age of speed, to which the automobile adds the finishing touch, yet it is thru the bicycle and the motorcycle that speed maniacs are now controlled, and taught due respect for the law. That wheel-mounted officers furnish the solution of this problem was grasped slowly by the police authorities, but the lesson has been learned very thoroly. Wheel squads, which were dying out a few years ago, are being formed all over the country, and those already organized are held in such high favor that the tendency is to increase the size of them as rapidly as possible.

In the one hundred largest cities of the United States, more than half of the police departments have or will have wheel squads at once, and the following tabulation furnishes some interesting comparisons:

	Bicycles	Motorcycles		Bicycles*

1908 "Torpedo" Motorcycles

The Hornecker Motor Mfg. Co., Whiting, l., includes two new models in its line "Torpedo" motorcycles for 1908, one of ich has a Thor outfit, and the other imported motor called the "Antoine." Besides these models a twin cylinder or type machine listing at $275, will obably be ready in a few weeks. The cing of the motor and the disposition its accessories on the 3 H. P. Model is like the usual Thor design, the motor ng placed vertically in a low loop in frame. The muffler is placed in front the crank case and consists of two cylrical chambers; in one the exhaust is banded, and in the other is broken up that the noise is deadened. As this ffler is said to produce no back pressure the engine the maker claims that no -out is needed; hence none is provided. conspicuous feature of this model is the cing of the crank hanger above the gine driving chain. The spring fork is same that has been used for three ars past, no improvement having been nd possible. The tank contains fuel, battery and coil. The battery comses three dry cells which are strapt ether with the coil. The equipment of del C includes a "Person's Motor Seat" l 2¼-inch G & J or Goodrich tires. The ight of this machine is 125 pounds, ish, bright vermillion and list price $225. side car attachment is furnished at $75. The other new model is Model D, and ists at $225, same as Model C. The 4 P. Antoine motor, by which it is driven, s a 3⅜-inch bore and a 3¼-inch stroke, l is placed vertically in the frame, ich is not looped as on Model C, but ries attaching brackets at the ends of seat mast and front stay, these brackets ng bolted to the crank case, front and r. A compensating sprocket is fitted this model and its equipment includes Splitdorf coil, Dunlop 2¼-inch tires, to $150. It is driven by a 2¼ H. P. Th motor, has the Torpedo spring fork, Th coaster brake, compensating sprock Empire (imported) saddle and weighs 1 pounds.

A racing machine, known as Model weighing 110 pounds is also offered. general specifications are same as Model C, but it is built lower, has a wh base of only 44 inches, and is fitted w G & J 1¾-inch tires. Price is $225.

The Commercial Car Show at Chicago

Special prominence was given the commercial car exhibits at the Chicago Automobile Show, November 30 to December 7, by having them placed in a separate building, these exhibits having been displayed in the Seventh Regiment Armory. This commercial car section comprised 22 separate exhibits of complete car makers, besides the various tires, etc., shown in the same building.

There was much talk among the commercial car makers of forming a separate association for the purpose of conducting independent commercial shows in the future, the general consensus of opinion being that by such an arrangement the expense would fall much more lightly on each exhibitor as a separate commercial show could be conducted more economically so far as the commercial car makers are concerned than as an adjunct of a pleasure car show. It was also the opinion of the commercial car exhibitors that the accommodations afforded them at Chicago were not what they should be, and the makers felt that this defect could also be remedied in the future by holding a show under their own direct management. Several meetings were held during show week at which the commercial car show project was thoroly discussed.

A summary of the complete car exhibits is given below. Besides these there were commercial car tires exhibited by Hartford Rubber Works Co., Hartford, Conn.; Firestone Tire & Rubber Co., Akron, O.; Morgan & Wright, Detroit, Mich.; Diamond Rubber Co., Akron, O., and Goodyear Tire & Rubber Co., Akron, O.; roller bearings by Timken Roller Bearing Axle Co., Canton, O.; batteries by National Battery Co., Buffalo, N. Y.; universal joints by Hartford Auto Parts Co., Hartford, Conn., and a line of forgings by Atlas Manufacturing Co., Fostoria, O.

SUMMARIES OF COMMERCIAL CAR EXHIBITS.

AMERICAN MOTOR TRUCK CO., Lockport, N. Y.—"American" Motor Trucks, with various types of bodies on 3 and 5-ton chasses.

COMMERCIAL MOTOR CAR CO., Times Building, N. Y.—"Safir" 4-ton truck, made in Zurich, Switzerland.

COMMERCIAL MOTOR TRUCK CO., Plymouth, O.—"Plymouth" Motor Trucks.

COPPOCK MOTOR CAR CO., Marion, Ind.—"Coppock" 2-cycle truck.

COUPLE GEAR FREIGHT WHEEL CO., Grand Rapids, Mich.—"Couple Gear" electric trucks and delivery wagons.

GIFFORD-PETTIT MFG. CO., 1217 Devon street, Chicago, Ill.—"Gifford-Pettit" 3-ton, 4-cylinder, gasoline truck.

FRANKLIN, H. H. MFG. Co., Syracuse, N. Y.—"Franklin" air-cooled, trucks and delivery wagons.

KNOX AUTOMOBILE CO., Springfield, Mass.—"Knox" waterless commercial cars.

LAMBERT MOTOR TRUCK CO., Anderson, Ind.—"Lambert" Friction Drive Trucks.

LEAR, OSCAR AUTOMOBILE CO., Columbus, O.—"Frayer-Miller" air-cooled trucks, made in one, two, two and a half and four-ton sizes.

LOGAN CONSTRUCTION CO., Chillicothe, O.—"Logan" commercial wagons for all purposes.

MEISELBACH, A. D. MOTOR WAGON CO., North Milwaukee, Wis.—"Meiselbach' 'one, two and three-ton commercial cars.

MITCHELL MOTOR CAR CO., Racine, Wis.—"Mitchell" trucks.

PITTSBURG MOTOR VEHICLE CO., Pittsburg, Pa.—Electric delivery wagons.

POPE MOTOR CAR CO., Hartford, Conn.—"Waverly" electric deliveries and service wagons.

RAPID MOTOR VEHICLE CO., Pontiac, Mich.—"Rapid" commercial cars in all forms and sizes.

RELIANCE MOTOR CAR CO., Detroit, Mich.—"Reliance" trucks.

SAYERS & SCOVILLE, Cincinnati, O.—Air-cooled motor trucks.

STUDEBAKER AUTOMOBILE CO., South Bend, Ind.—"Studebaker" electric commercial wagons.

THOMAS, E. R. MOTOR CO., Buffalo, N. Y.—"Thomas" taxi-cabs.

WEEKS COMMERCIAL VEHICLE CO., Chicago, Ill.—"Weeks" commercial cars.

WORTH MOTOR CAR MFG. CO.—"Worth" friction drive commercial cars.

British Commercial Vehicle Trials

The recent English commercial vehicle trials organized by the Royal Automobile Club proved without doubt the most successful ever held, and fully demonstrated to the public their reliability and usefulness. Fifty-three of the sixty starters survived the test, which lasted for a period of five weeks.

The vehicles, starting on September 9, proceeded from town to town, along a route from London, embracing Bristol, Liverpool, Sheffield and the Midlands, returning to London the second week in October. The mileage per day varied from thirty to seventy, according to their class, the classification being based upon the net load. Exhibitions interrupted the tour at Bristol, Birmingham, Liverpool, Manchester, Leeds, Sheffield, Nottingham and Bedford.

The Firestone Dual Tread Tire, manufactured by the Firestone Tire & Rubber Co., Akron, Ohio, and described in our July 1907 issue, page 140, has recently been improved by corrugating the surface of the two ridges of rubber extending around the tire, thereby giving it additional traction and reducing the liability of skidding.

Experiences of Commercial Motor Car Users

"Thinks Motor Cars Should Have More Simplicity"

Diney, Nachbaur & Co., Joilet, Ill., have been using two 10 horse power Cadillac gasoline delivery cars for delivering light packages in the city of Joilet, which has about 40,000 inhabitants.

The cars cost $950 each, and have been in use for 2 and 3 years, respectively. Each car makes 4 trips daily, with about 25 calls per trip, making an average of 50 miles per day. The average weight of load carried is 500 pounds. Gasoline and lubricating oil is figured at $15 and $5 per month per car respectively. Average monthly cost for repair work and repair parts is $50 per car. This concern stores its car at their own storage house. They pay their operator $65.00 per month and the helper $40.00. They have not experienced any trouble in securing a competent driver. They figure the car to depreciate 40 per cent. in value each year.

The most needed improvement suggested by their experience lies in the tires, which they claim to be their greatest expense. They consider speed to be the greatest advantage of the motor car over the horse vehicle.

In order to meet the requirements of their business they state the motor car should possess greater simiplicity, be geared so as to prevent excessive speeding, and be fitted with solid tires.

Government Uses Electric Vehicles

The Department of Commerce and Labor, Bureau of Standards, Washington, D. C., has at the present time in use two delivery wagons of the electric type. One of these machines has been in use for several years, and being of rather an early type it has numerous features of construction not found in a modern delivery vehicle. Among these may be mentioned pneumatic tires and the motors attached to the running gear which is considered the most serious defect, since all the vibration is transmitted directly to the motor brushes, and in consequence causes no end of commutator troubles. They are, however, using this machine, which is of 1000-pound capacity, when for any reason their larger machine is out of service. The second machine referred to, which is of 2000-pound capacity, has been in service about four months, hauling freight, express mail and general supplies between the Bureau and the city proper. The Bureau's buildings are located somewhat in the suburbs, the roads traversed being partly asphalt and partly macadam with one grade of 11 per cent. This machine has covered 46 miles, fully loaded over the average city streets on one charge of the battery. The machine is equipt with one motor, the nominal horse power of which is 2.85. The battery consists of 44-13 MV Exide cells. The average daily load is about 1500 pounds and the average mileage covered each day is approimately 15, with about 8 to 10 stops per day. They store this car at their own plant, having also their own generating equipment. Having other storage batteries to care for in connection with their plant, they find it advantageous to care for this machine themselves rather than to store it at a garage. Garage storage is ordinarily to be preferred where but a few machines are being operated, since in this case the expense of employing a competent battery man for the few machines would probably cost more than garage storage, in other words too much stress cannot be put upon the importance of the proper care of the battery of an electric machine. The neglect of this feature will determine in most cases whether the vehicle is a success or a failure. The most needed improvement in motor cars suggested by their experience, is a lighter battery. Concerning the driver, they have proceeded on the theory that to employ a man of intelligence and make him responsible for the maintenance of the machine is the best policy. The battery washing and repairs of any considerable extent are done by the regular mechanics employed at their plant.

Logan, 1908, Trucks are very excellently illustrated and described in a handsome big catalog just issued by Logan Construction Co., Chillicothe, O. As good stock, elegant taste and high-grade engravings have been used, the catalog makes a good impression at first glance, and as the descriptive matter is of a really informative and practical nature, the man who is thus induced to read it is well satisfied that the time thus spent is well spent.

A piano dealer who sells a great many instruments thruout the Middle West has placed his second order for a large Frayer-Miller truck capable of carrying four pianos and with sides which fold out, providing room for people to examine the pianos. This truck is to be sent thru the Middle West with the purpose of selling pianos to the farmers. This scheme has proved a success with a horse-drawn truck which carried only one piano. The truck not alone carries four pianos, but will travel at nearly four times the speed of the horse-drawn truck. It is the product of Oscar Lear Automobile Co., Springfield, O.

"Quicker and Better Service—Perfect Satisfaction"

In enumerating his experience with the motor car in the passenger transportion business, Mr. Harry L. Briscoe, manager of the Dingman's Ferry & Bushkill Auto Co., Dingman's Ferry, Pa., expresses himself very enthusiastically in favor of motor cars as a means of transportation.

He has been using a Rapid 24 horse power gasoline car, manufactured by the Rapid Motor Vehicle Co., and which he states has been very satisfactory to him. This car employs a double opposed motor. The price of the car is $3200. With this car an average weight of 3000 pounds is carried per trip, of which two are made each day, making a total of about 50 miles per day. The operator is paid $75.00, no helper being employed. Mr. Briscoe states that with good care the depreciation of the car figures very little. The average charge per month for charging of battery is $1.50.

The car is fitted with a set of Firestone solid tires costing $280, which have been in use for 2 years, and are claimed to be as good as new. They have had considerable trouble in securing a competent driver, but have gotten over the difficulty by taking home men who are interested in the company's welfare, and training them into the work. The most needed improvement in motor cars as suggested by their experience lies not in the motor car itself, but in the driver who they state should be one who will take an interest in his car and not neglect it when out of order.

Hewitt Truck Hauls Coal Very Successfully

Herbert Brothers, of New York City, dealers in coal, during last October placed in service a 5-ton Hewitt coal carrying truck, built by the Hewitt Motor Co., 6-8-10 East Thirty-first street, New York City, which has been making regular deliveries in New York since that date.

The tentative arrangement entered into with the Herbert Brothers was that they were to pay the Hewitt Motor Company 40 cents per ton of coal delivered on their average haul, which they considered was about two miles out and two miles back. It is claimed that at this price, which was the very lowest of any haulage made, the truck can compete with horses and make money for its owners. In any haulage where feight can be had in both directions the truck will of course earn double this amount of money, even at these very low rates. The truck was originally designed for 5 tons, but has worked so satisfactorily that the load was increased to 6 tons without giving any trouble in any of the parts. The truck hauls 6 tons up a 4½ per cent. grade on the high speed with ease. When running under 6-ton load the gasoline consumption varies from 2 to 3 miles to the gallon. This can probably be reduced by more careful attention to the carburation, as other cars of the same design are running 3½ to 4 miles to the gallon with equal loads.

On short hauls with heavy loads the truck is found to compete with horse haulage in good weather, and in icy or snowy weather, or in the heat of summer, its cost is much less than horses. Beyond 2 miles the truck becomes much cheaper than horse haulage, and when the distance exceeds 10 or 12 miles the cost is less than one-half of horse delivery.

A week's record taken from November 11 to 16, inclusive, of the Herbert Brothers deliveries, shows an average of 7 1-3 loads hauled at an average of nearly 30 miles per day. The average daily weight carried for that week was 89,516 2-3 pounds.

A three months' cost sheet from the New York Telephone Company, also users of a Hewitt truck, shown herewith, illustrates how they figure their expense.

Monthly record, 5-ton gasoline truck, 1907:

	Aug.	Sept.	Oct.
Wages	$105.25	$98.07	$122.64
Garage	45.00	36.50	26.75
Gasoline	50.75	37.00	39.30
Oil	17.00	23.80	27.75
Tires	.....	.....	84.02
Repairs	.....	5.68	1.45
Monthly mileage	540	514	601

Interest at 5 per cent. is figured at $235.00; insurance, $50.00; depreciation at 10 per cent. equals $470.00, or a total of $755.00 per year.

After more than two years' experience with these cars the Hewitt Motor Company have made up the following schedule of operating cost, which has been arrived at from consultation with various customers using the cars in different lines of service. This schedule has been shown to a great many factory superintendents, and they regard it as extremely fair and reasonable. The schedule embodies the maximum of expense and will not be exceeded. The tire allowance is rather larger than is found to be necessary, but this is what the maker of the tires will guarantee on this truck. The repairs and maintenance of the car are rather less in practice than shown in the list.

Cost of operating the Hewitt 5-ton truck for one year, considering contingencies, is as follows: Price of chassis, $4500; price of body, $200; 300 working days; 40 miles of operation per day; 10,000 pounds per load; depreciation per year figured at 20 per cent. is $940.00; interest at 6 per cent. equals $282; gasoline, $450.00, counting 3.75 miles per gallon; lubricating oil, $90.00, 40 miles to the gallon; insurance, $47.00; tires, $800.00; overhauling, $200.00, and repairs, $150.00. The total figures to $3,859.00 for one year, or $12.86 per day, or 32 1-7 cents per mile or about 6½ cents per ton mile.

THE NEW ONE AND TWO-TON MODE

The smaller models of 1 and 2-ton c city are driven and steered from the f wheels only, as it is believed that these carrying capacities four wheel ing is not necessary. The rear wheel the one-ton model are similar to thos an ordinary horse-drawn express wa being of large diameter and equipt steel tires. The front wheels are sin to the motor wheels of the five-ton tr and are fitted with 3½ inches side rubber tires. Thus it will be seen this machine has front instead of driving wheels. When specified 36- dummy wheels of the same appearanc the motor wheels in front are supplie the rear, these being equipt with the s sized rubber tires. The motor wheels the two-ton model are fitted with 5- tires and the rear wheels are supp with either rubber or steel tires at option of the purchaser. The same s of controller, giving five speeds forw and five reverse, as used on the large chine, is fitted to the smaller models. one-ton truck is capable of a speed miles per hour loaded and 11 miles hour empty, while the speed of the ton truck is 7½ miles per hour with and 9 miles per hour empty.

A Chauffeur's Moral Code

As a model code for chauffeurs, stone Tire & Rubber Co., Akron, O., compiled a set of rules printed in the f of a certificate on a hanger which l like parchment, and carries a clever tation of a very legal looking seal. code contains ten suggestive paragra each dealing with some abuse of com cial car tires to be avoided or some to be taken for the purpose of getting of tires all the "life" and service the in them.

The chauffeur is cautioned not to o load his tires, to keep the brakes wor evenly, and the axles and wheels t up, not to allow oil or grease to acc late on the tires nor expose the tire great heat, to start the vehicle straight line, to start and stop it g ually, not to run the vehicle along s car tracks in such a way as to grind d the edges of the tires, to avoid, when sible, rough pathways, to take car tr preferably at an agle, to repair tire soon as they need it.

The "Iversen" Commercial Axle

A new hub construction for commercial trucks has recently been added to the products of the Iversen Manufacturing Co., of Pittsburg, Pa. The construction is of the floating type, the wheels being mounted on very large roller bearings on the axle sleeve, and driven at the outer ends of the hubs from the driving axle by means of a system of planetary gears, the object being to construct a rear axle with the required large gear reduction without placing too high strains on the equalizing gear and transmission, and also to do away with the countershaft and the side chains. This axle is ordinarily furnished with Iversen rear-axle transmission, as described in the October issue of the Journal, page 182. The construction of the transmission is exactly the same as for pleasure cars, with the exception that the gear casing is made very much stronger, as are also the axle sleeves, hubs and brakes. The axle sleeve is 3⅜-inch outside diameter and the thickness of walls as much as ⅞-inch, depending on the carrying capacity of the truck. The gear reduction in the outer end of the hub is 3 1-3 to 1. Five pinions are used to transmit the power, in order to gain maximum strength and wearing qualities in the least possible space. The gears are all case-hardened, and are mounted so that they can very readily be taken out by removing the hub cup. The torsional strain is taken care of thru the spring seats, which are clamped on a hexagon part of the sleeve, by means of a brace extending perpendicular on each side of the truck, and a link connecting this brace to the frame at either end of the springs, thereby giving the body perfect play without moving the axle to any perceptible extent. The brake construction is similar to the one used for pleasure cars, except very much larger and stronger.

The "Iversen" Commercial Axle Hub.

Firestone Tire & Rubber Co., Akron, O., exhibited at the various national automobile shows a solid tire measuring 53½ inches in diameter, said to be the largest tire at any of the shows.

Arbuckle Brothers, of Brooklyn, N. Y., have purchased a 4½-ton Frayer-Miller gasoline truck.

Commercial Vehicle Notes

The Model Transfer Company, of Hackensack, N. J., has three Knox trucks in operation between New York and Ridgewood, N. J., doing the work of four two horse teams.

The fire department of Long Beach, Cal., after using a Rambler automobile with a chemical apparatus installed in place of the tonneau for sometime, has given an order for two more Rambler cars which will be equipt with chemical apparatus.

Chief of Police Delaney, of Denver, has been provided with a Thomas Detroit runabout.

The Findlay Auto Transit Company, of Findlay, Ohio, has recently closed a contract with the Standard Oil Company, whereby the former will convey the workmen on the pipe lines between Cygnet and Lima to and from their work. At six o'clock every morning a bus leaves the courthouse at Findlay, taking the workmen out and bringing them back at six in the evening.

An ordinance which aims at the taxing of all public service motor vehicles at the rate of $100 a year, is to be introduced into Buffalo council.

The Idaho Automobile & Electric Transportation Co., has started an automobile bus service between Dubuque and East Dubuque, Iowa., making trips every hour.

The municipal authorities of Reading, Pa., have placed an order for small York Pullman touring car to be used by the chief of the fire department.

Haworth & Dewhurst, of Pittsburg, Pa., are using a large Frayer Miller truck, carrying loads of from 6,000 to 7,000 pounds over Pittsburg hills. The company reports that it does the work of two and a half teams at less than half the expense. The operating cost averages 2½ cents per mile.

The L. J. Fisher Furniture Company, of Rochester, N. Y., some time ago purchased and placed in service a large motor truck for the purpose of making retail deliveries. With the bus the company is able to make a delivery a distance of 32 miles and return in four hours, where with the horse delivery it was necessary to start at 8 o'clock in the morning, and then the wagon would not return until night.

THE CROSBY COMPANY, Buffalo, N. Y.

Proof Against Wheel Accident

Indestructible Steel Wheels

are the only absolutely safe, always reliable wheels for your runabout, touring car, wagon, or truck. They have been proven mechanically perfect by the severest test an automobile was ever subjected to. **Indestructible Steel Wheels are the only wheels made that cannot collapse.** They stand up under the most terrific strain from heavy loads, great speed and rough roads. Are in constant increasing use on commercial vehicles of all descriptions, Fire Patrols, and pleasure cars in cross-country touring. Everywhere that wheel strength is required.

Indestructible Steel Wheels are stronger, lighter, faster, cleaner, truer, and cheaper than other wheels, and are being adopted throughout the country as standard equipment. Our open-pattern wheel is transparent when in motion and makes a handsome appearance on your pleasure car, as well as being **proof against wheel accidents.**

Write to-day for catalog and prices on a set of Indestructible Steel Wheels attached to the present hub and rim of your car.

We make all kinds of Automobile Steel Stampings.

Licensed Association to Have January Show

At a well attended meeting of the Board of Managers of the Licensed Association held at the Association offices in New York, the morning session was given over to a regular business meeting, the Board receiving the reports of the Executive Committee and the various departments of the Association.

The afternoon session, however, was given to a discussion of the show situation. A report of the Eighth National Show was made to the Board by the Show Chairman, Col. George Pope, which was very enthusiastically received. The time for holding shows was freely discussed and whether early or late shows were the better given a thorough investigation. Col. Pope pointed out very clearly the advantages of a late show. The Board, acting upon Pope's suggestion, voted that the next, the Ninth National Show be held in the Garden in January, 1909.

Commercial Car Manufacturers Form New Association

This association which had its conception at the recent Chicago show, was finally organized in Chicago, under the style, the Commercial Motor Vehicle Manufacturers' Association. Walter Wardrop is its chief executive, the other officers being as follows: President, G. M. Weeks, Weeks Commercial Vehicle Company, Chicago; vice-president, Oscar Lear, Oscar Lear Automobile Company, Springfield, Ohio; treasurer, H. F. Hamilton, Rapid Motor Vehicle Company, Pontiac, Mich.; secretary, J. E. Burke, Lambert Motor Truck Company, Anderson, Ind.

Vanderbilt Cup To Be Held

At a meeting of the executive committee of the racing board of the American Automobile Association a resolution was adopted to the effect that the William K. Vanderbilt Jr., cup commission promote a race for the William K. Vanderbilt, Jr., cup during 1908. The date of competition, the entry blank, the rules governing the competition, the form of declaration and the course, will be announced by the commission by July 1, 1908.

A. L. A. M. Mechanical Branch Meet

On Saturday, December 7, the Mechanical branch of the Association Licensed Automobile Manufacturers met in the committee rooms of Chicago Athletic Association. The principle topic was co-operation between automobile engineers and body builders. A discussion was also held with regard to what parts could profitably be standardizedtduring the coming year.

N. A. A. M. Decides on Later Show Date

Following the lead of the "Licensed" Association in reverting to the former midwinter dates for its annual shows in Madison Square Garden, the National Association of Automobile Manufacturers, at its recent meeting in Chicago, has decided to hold its next annual show in Chicago the first week in February, 1909, or two weeks later than the Garden show.

At this meeting a proposition to establish a comprehensive traffic department was referred to the Transportation Committee and resolutions of regret in the death of M. L. Goss of the Executive Committee, were adopted.

A. C. A. To Control Ormond Beach Races

At a meeting of the contest committee of the Automobile Club of America held on Wednesday evening, December 19th, at the club house, the report of secretary Butler on racing conditions at Ormond-Dayton Beach was presented and discussed and the agreement with the Florida East Coast Automobile Association turning over the entire control and management of the races to the Automobile Club of America, was ratified and approved.

The date of the races was fixed for the week beginning Monday, March 2nd, 1908.

At thet time the weather conditions and temperature are at their best and the tidal conditions will afford from five to six hours daily of good beach.

Arrangements have been completed to provide an approximately 16 mile straightway course with loops at each end. The loops will be constructed of two inch planking, furnishing a roadway 32 feet wide, and will be banked six feet high at the outer edge of the curve.

By this means a 32-mile circuit is available, beginning and ending at the club house of the F. E. C. A. A. on the beach at Daytona, in front of which all of the long distance races will start and finish.

It is possible that no race will take place for the Thomas Dewar International Automobile Trophy at Ormond-Daytona Beach this year as the present holders of the trophy, Stanley Motor Carriage Company of Mass., refuses to allow an amendment of the rules under which the trophy is to be competed for, as will be necessary if the requirement for competition stands as stated by the Automobile Club of America, that all cars entering for the international Mile Dewar Trophy must first of all take part in a hundred mile event and show a speed of sixty miles per hour.

The auto clubs are planning for special trains to the event, which takes place at the zenith of the Florida season.

A. A. A. Grants Sanctions

Three sanctions were granted at a meeting of the executive committee of the Racing Board of the American Automobile Association on December 29, at the association's headquarters, at 437 Fifth Ave., New York. Automobile Club of America, Ormond-Daytona, Fla., week beginning March 2, 1908; Savannah Automobile Club, Savannah, Ga., stock car road races, week beginning March 15, 1908. Robert Lee Morrell, chairman, first road race for Briarcliff trophy, Westchester County, N. Y., April 24, 1908.

Third Annual Meeting S. A. E.

The Society of Automobile Engineers held its third annual meeting in New York January 3. A. L. Riker, president of the society, opened the afternoon session and after the various committees had made their reports the annual election of officers was held. Thomas J. Fay of New York was elected president. E. T. Birdsall, Rochester, N. Y., second vice-president and Henry Hess, Philadelphia, treasurer. The other officers are Henry Ford, Detroit, first vice-president, and H. P. Maxim, L. T. Gibbs, H. M. Swetland and H. W. Alden, managers.

After the election papers were read and discussed. The annual dinner was held in the evening, followed by a second business session. It was decided to hold quarterly meetings in the future, the next one being scheduled for Boston during the progress of the local show there March 7 to 14.

New York Tire Chain Ordinance Protested

A hearing was recently accorded the protestants against the ordinance prohibiting the use of tire chains in any of the public parks or traffic roads of New York City under the jurisdiction of the Board of Parks, without permission. The protestants were supported by C. T. Terry counsel for the N. A. A. M. Little was accomplished however. The Board would not listen to any suggestions that it acted outside of its rights and stated that this question would have to be fought out in the courts.

Motorists in general feel that the ruling is based on an insufficient knowledge of the action of different anti-skid devices as it is well known to automobilists that there are other devices which cause even greater damage to roads and these are not condemned by the Board.

The Irresistible Line for 1908.

BUILT AND TESTED IN THE MOUNTAINS.

The Reading Standard Bicycle line includes single frames, Truss frames, Double Head frames; Roadsters, Road Racers and Racers and Pace-followers from $25.00 to $60.00.

The "R-S" Motor Cycle line includes single Cylinders, Twin Cylinders, Motor Bicycles, Tricycles, Ladies' Tricycles, Men's Tricycles, Delivery Tricycles. Prices from $175.00 to $325.00.

ALL "R-S" MOTOR CYCLES except Model "B" have the "R-S" MECHANICAL INTAKE VALVE MOTOR, the first and only Real Mechanical Intake Valve Motor manufactured and marketed in the U. S. today. The advantages and superiority of the mechanical intake valve motor over the automatic are so apparent that other manufacturers are now beginning to follow our lead.

Our New Binding

Attention of the readers of the Cycle and Automobile Trade Journal is called to the new method of binding without wires, used for the first time on this issue. Kindly test it for serviceableness. We will be glad to hear the opinion of any of our readers of this new binding.

New Models Each Season a Mistake

Perhaps one of the greatest mistakes that is being made in the automobile business at the present time is the complete change of models each season. Under this system many cars embodying features, known to be less-reliable or effecient than constructions already tried out by makers, are sold and the latest improvements withheld, simply that they may be incorporated later in the new models. The time was, when changes were so many and each necessitated such radical and wholesale alterations in the arrangements of the other parts of the mechanism, it was almost necessary to make a complete new model each time improvements were introduced. The advances in car design were so rapid that each year new cars made the previous models look, and often in comparison run, like "back numbers," Under these conditions, there was not only excuse for a complete change of models each year, but this change was in reality necessary. Wealthy purchasers were nearly always induced to turn in their old car at a great sacrifice as part payment on the new one, so the change of models really was an advantage to the manufacturer, although, of course, during this period, what was gained in additional purchases was offset by additional cost of special machinery. Gradually, however, the changes in the standard type of touring car became less and less and purchasers showed tendency to hold on to the old model for several years. This practice most of the makers seem to discourage, and at the present time a large part of the makers seem to be endeavoring to perpetuate the system of complete model-changes each year by changing as far as possible even the external appearance of the machines, although the mechanism is practically unaltered and there are not really marked improvements; apparently in order to make the previous model look antiquated in the hopes of inducing purchasers to buy the latest types.

We firmly believe that at the present time the "change-the-model-each-season" policy is a grave mistake and is an injustice to the unfortunate late-season car purchaser, as in numerous cases where real improvements have been perfected by the makers,these are withheld, and many of the last of the models of the season are put through without the sometimes needed improvements. Purchasers at this season, are, therefore, deprived of the benefit of the changs and are often made dissatisfied and discontented. But not only are the purchasers made discontented, but by this arrangement the selling season is much shortened to the great disadvantage of the agent, who finds that in the late summer and fall which ought to be a good selling time, the public will not buy, but wait for the next year's model, although in many cases they really want and would enjoy the use of a car for the remainder of the open season. In this way, the selling season is practically limited to the spring after the shows and part of the summer, instead of being continuous.

The automobile shows have also had a strong influence toward the continuance of the yearly new models. Each maker desired to keep quiet his new feature and designs, to spring them, as it were, at the show. Thus, the yearly-model habit has become so strong that many makers do not seem to realize, the industry has really progressed beyond that stage, and the continuance of an abrupt change of models at a definite time each season is unfair both to the agent and purchaser and will doubtless react even on the makers themselves.

Several well known and progressive manufacturers, however, realizing the present conditions, have openly announced their policy

Hosted by Google

of immediately incorporating in their cars, constructional changes and improvements as rapidly as manufacturing conditions will allow, thus, assuring the purchaser that at any time be will get the very latest ideas and constructions of the designer and the very best car the company is capable of producing, and not a machine containing several unsatisfactory or obsolete features which the makers themselves know are objectionable. The immediate improvement policy if adopted by many of the makers, would produce a practically continuous selling season and not one, unnaturally curtailed at certain periods and forced or rushed at others, as is now the case. This policy would not in any way interfere with exhibiting at one or two purely National and representative shows and is it believed that the general abolition of the system of a yearly change of models will do much toward bettering, not only conditions for the purchaser and agent, but also for the manufacturer and the entire industry.

Farmers' Autos and Good Roads

Too much cannot be said in regard to the good roads movement which is steadily increasing throughout the country. The bettering of road conditions has been discussed for years, but the actual work of improving conditions has progressed but slowly, until now, the advent of the automobile and its growing numbers and popularity has probably done more to bring about actual improvements than any other one previous agency.

The farmer for years has been content to plod along at a snail's pace over all but impassable roads, but just as soon as the same farmer becomes the proud possessor of an automobile, no matter how antiquated, he immediate becomes dissatisfied with the road that was previously good enough and forthwith joins either the ranks of the good roads workers, or the larger fraternity of "kickers," who however help along the agitation.

One of the silent workers for the cause of good roads is the stationary gasoline engine, which is surely, if slowly, educating the male members of the farming communities to the use of the internal combustion engine, from which it is but a step to the use of the automobile. The prevalence of these small stationary engines in the rural districts is increasing at a rapid rate and already many farmers have, through their use, been lead to take up the auto.

Another feature which is also working for the common good is the fact that the horses are gradually becoming accustomed to the automobile, there are fewer accidents and this fruitful source of antagonism toward the motorist and everything for which he stood, has been to a large extent removed.

The introduction of the high-wheel type of auto has also had its share in influencing the farmers of our country districts toward a more friendly attitude to the self-propelled vehicle, for in the buggy-type was apparently recognized an old friend without the limitations imposed by the horse. In fact, the modern buggy type of automobile fulfills the dream of more than one mechanically-inclined American farmer and has already done much, and in the near future will do more, to change his attitude toward automobiling.

With motoring becoming almost universal and the old antagonism of the members of our farming community, a thing of the past, it is but a question of time when our country will be interlaced with as splendid a system of highways as those seen in many European countries, for as a unit all will be working toward the one, long cherished ideal,—the perfect highway.

The Tire Chain Ordinance

No little comment and criticism has been aroused by the recent passage by the Board of Parks of New York City, of an ordinance prohibiting the use of tire chains on any of the roads in the public parks, under the jurisdiction of the Board. Even the question of the legallity of this ordinance has been brought up, but this, of course, is a matter for settlement in the courts. The point has also been raised and justly, that if wet, greasy, roads are dangerous, they should not be made more so by the action of the Park Board, by enforcing ordinances preventing the use of certain non-skid devices.

Not discussing these points, however, the fact remains that the Board has discriminated against only one type of anti-skid device—the chain, what about the others? Has the Board made any preliminary tests as to the detrimental effects of the different anti-skid devices at present employed by automobilists, that they single one device and say nothing whatever about the others. It would seem not, for it is well known among automobilists that the loosely fitting chain is one of the least harmful of anti-skid devices and it would appear but reasonable that before such a radical action was taken, that tests, at least of an elementary nature should be made.

That the automobile especially at high speed and equipped with anti-skidding devices has a detrimental effect on the roads is not questioned. However, the speed of the machines in the Park system is very seldom high and is not such as to be particularly harmful But, in wet weather such devices are necessary and especially so in cases of emergency when the successful negotiation of a shorter turn than usual, may mean the avoidance of a serious accident.

It is usually conceded that roads are made for all classes of vehicles, and not vehicles for

Hosted by Google

the roads, and when a road is particularly dangerous it certainly looks like a move in the wrong direction to prevent the use of saftey devices, even though these may be somewhat detrimental to the road surface, and it looks especially peculiar when but one of a number of such devices is singled out as an offender apparently without suitable tests having been previously made to determine their relative destructive effects. We sincerely hope that the Metropolitan motorists will follow up the matter until it is either entirely done away with or suitable amendments made.

Dealers' Spring Opening Week

The Spring opening week idea seems to be gaining ground among the automobile dealers. The recent decision on the part of the New York Automobile Trade Association and the Dealers' Association of Chicago to hold carnival opening weeks, sets a precedent which will, doubtless, soon be followed by the dealers in many other cities thruout the country. It is proposed to hold open house during the week, everybody welcome, to have the salesrooms decorated and also have an automobile parade.

Dealers everywhere realize the importance of giving the mind of the buying public a chance to review the good points of the various make of cars and compare one with another, just before the actual driving season opens. The effect of the automobile shows, except that in Boston which is usually held very late, has worn off by spring and those who have not purchased cars desire another chance for comparing the different cars. The open week among the dealers gives just the opportunity needed for the buyers' ideas to crystalize and take definite form. The carnival week will also stimulate the dealers to activity, and the necessary making ready of the salesrooms will be a splendid preparation for the work of the coming busy season. Everything must necessarily be put in shape for inspection, and it is believed the result will be very beneficial to all. The necessary meetings among the dealers in preparation for such an event will make them better known to each other and may in certain cases, lead to organizations which will be not only beneficial to the members, but thru systematising the dealer's methods will prepare the way for better service to the purchasers.

In most of the large cities the automobile dealers are collected in a comparatively small section making it possible for visitors to view the leading makes without much difficulty. The time of year is suitable and road demonstrations or contests could well be held during the week, thus giving the purchaser a much better chance of comparing actual performances than is given during the Winter months.

Ignition Testing Department

In our December issue page 64, was published a letter by Mr Jackson of the Semi-Dry Battery Company, Harrison, N. J., suggesting the establishment of a Department of Ignition and stating the need for experimental work and testing as a basis of formulating rules.

We have heard from a few of our readers in favor of such a project and are ourselves heartily in sympathy with the idea of systematic tests, as a basis for standardizing and simplifying ignition equipments. However, there are too many laboratories well equipt for such work, and too many organizations which would naturally interest themselves in such a testing department, for us to attempt to carry on such a series of exhaustive experiments as would be necessary to obtain important results.

We do not agree with the suggestion that such investigations be carried on by a man who has not had scientific training even tho he has "the mental equipment for investigation," much better, have a man with this same mental equipment backed up by every bit of information available from the experiments and failures of others and thoroughly familiar with the state of the art, unless time and money are to be thrown away. The automobile industry has already suffered too much from the abortive efforts of the untrained but experimentally inclined.

We call attention to the fact that there already exists an organized body of engineers, intimately associated with automobile industry, a body which is "non sectarian" as it were, who are eminently fitted to undertake this investigation; we refer to the "Society of Automobile Engineers," which is unofficiated and which could give unbiased opinions.

We herewith suggest that if the matter is of paramount importance to the advancement of the automobile, the above mentioned society undertake the work and make public results. The Cycle and Automobile Trade Journal will be only too pleased to place before its readers any new facts which such investigations may bring forth.

Thru an error the address of the Lane, Motor Vehicle Co., well known maker of the Lane Steam Cars, has twice appeared incorrectly in our columns. The factory of the Lane Motor Vehicle Co. is at Poughkeepsie, N. Y., and the Lane Sales Co., which handles the output is 514 West 145 St. New York City.

The Tincher Motor Car Company of South Bend, Ind., was recently elected to membership in the American Motor Car Manufacturers' Association, making a total of 52 members belonging to the independent organization.

Fires, Failures, Judgments, Etc.

Atkinson Automobile Co., Lockport, N. Y., filed an involuntary petition in bankruptcy with assets of $3,909.25, and liabilities of $3,006.47.

Auto and Motor Co., Baltimore, Md., Chas. M. Quigley has been appointed receiver.

Buckeye Motor Car Co., Columbus, Ohio. At a recent meeting of the stockholders, action was taken to dissolve the corporation.

Caille Perfection Motor Co., Detroit, Mich., sued by the Termaat & Monahan Co., of Oshkosh, Wis., for alleged infringement of patent.

Cargill, W. W. La Crosse, Wis., garage destroyed by fire; loss $15,000.

Colt Runabout Co., 1876 Broadway, N. Y. City. Judge Hough has appointed Harvey Osterman receiver in bankruptcy; bond $500.

Craig-Toledo Motor Car Co., Toledo, O. Joseph W. Lane, trustee of this company has instituted a suit for $18,000 against Geo. L. Craig, vice-pres. of the company to recover the difference between $2,000 held to be a fair settlement to a creditor and $20,000 allowed Craig in the form of eight Craig-Toledo automobiles at the time the company went into bankruptcy, June 1907.

Delaware Auto Storage and Repair Co's. building, Eleventh and West Sts., Wilmington, Del., damaged by fire. Loss to building $25,000, and to cars $15,000; partly insured.

Dolson Automobile Co., Jackson, Mich. At the creditor's meeting E. R. Hathaway was appointed permanent receiver.

Duryea Power Co., Reading, Pa. Judge McPherson, of the U. S. District Court, filed an opinion sustaining decisions of Referee Samuel E. Bertolet, in his rulings in connection with the bankruptcy proceeding of the Duryea Power Co. When the matter of electing a Trustee for the bankrupt came up, Mr. Bertolet would not permit the claim of Herbert M. Sternbergh, President of the company, to be voted owing to the contention that Mr. Sternbergh was not a creditor but in reality owed the concern $26,000 on his stock subscription. This decision prevented Mr. Sternbergh in securing the election of the Trustee favored by him, giving the Berks County Trust Company a majority of the claims and amount.

Echo Bicycle & Automobile Rooms, Young St., Buffalo, N. Y., destroyed by fire, causing a loss of $5,000.

Elmore Auto Co., 243 W. 68th St., New York City; ground floor damaged by fire; loss $150.

The Electric Vehicle Co's. estate, Hartford, Conn., is valued by the appraisers at $1,709,603.08, which does not include the Selden and other patents.

Fay, Owen H. & Co., 243 Michigan Ave., Chicago, Ill.; garage threatened with complete destruction by fire, but flames were distinguished with small loss.

Funke, Albert H., Brankrupt, New York City. The Referee in Bankruptcy, Mr. John J. Townsend, declared a second and final dividend out of the above estate of 11¼ per cent., on Dec. 20th 1907, all claims for which were paid out on Jan. 10, 1908 by Messrs. McLaughlin, Russell, Coe & Spragne, 32 Liberty St., New York City.

Guarantee Tire & Bicycle Co., Indianapolis, Ind., damaged by fire; loss $15,000, which was covered by insurance.

Harrington Auto Station No. 1, Worcester, Mass., petitioned into involuntary bankruptcy; claims amount to $565.

Harrison, H. O., 1214 So. Main St., Los Angles, Cal., garage damaged by fire; loss $1,250.

Holmes-Booth Auto Co., 10550 Euclid Ave., Cleveland, Ohio. A receiver has been appointed. The concern places its assets at $3,000 and its liabilities at $6,000.

Huntington Automobile Co., Jamacia, L, I; Clifford M. Tappen has been appointed temporary receiver.

Interurban Express Co., 62–66 Washington St., San Francisco, Ill. Fire starting in the company's garage on December 31 st 1907, caused the destruction of an entire block in the business district. The loss is estimated at $35,000.

Kansas City Motor Car Company, Kansas City, Mo.; Mr. J P. Ryland, of the firm of Ball & Ryland, has been chosen trustee in bankruptcy.

Kings County Automobile Co., Brooklyn, N. Y., which did a general garage business and handled the Glide car, has assigned.

Larchmont Automobile Co., Larchmont, N. Y., filed petition in bankruptcy with liabilities of $2,268 and assets $341, in stock, fixtures and accounts.

Northwestern Motor Co., Seattle, Wash.; Geo. R. Tennant has been appointed receiver.

Pope Mfg. Co. Receiver of the company has been authorized to sell their factory at Thompsonville, Conn.

Prestolite Co., Indianapolis, Ind.; main pumping station entirely demolished by explosion of gas tanks.

Times Square Automoblie Co., N. Y. City, sued by Rear Admiral James J. Kane, U. S. N., for the sum of $2,600.78, to recover amount paid for repairs etc. on machine bought from said company.

Zwich & Kleese, dealers in automobile and automobile supplies, 114 Wick Ave., Youngstown, Ohio. Receiver has been appointed by Judge Roberts to take charge of the business, and arrange for the dissolution of the partnership.

Trade Changes

Buckeye Motor Car Machine Co., of 494 N. High St., Columbus, O., consolidated with the North Side garage of the same address, under which name in the future both concerns will be known. E. B. McDowell will continue as manager.

Christoffer, C. M. 530 Stanyon St., San Francisco, Cal., is succeeded by I. W. Houchin.

G and J Tire Co's, Philadelphia branch, 711 No. Broad St., has secured new quarters at 713 No. Broad St., directly across the street in a corner building, which gives them about twice the amount of room formerly occupied.

Gleason-Peters Air Pump Co., removed its offices and factory from 121-125 Mercer St., N. Y. to 225-261 Classon Ave., Brooklyn, N. Y.

Gordon Auto Supply Co., moved from 217 Eliot St., Boston, Mass., to 1024 Boylston St., Boston, Mass.

Indestructible Steel Wheel Co., recently moved its Chicago office and salesroom from 1303 Michigan Ave, to the Auto & Parts Bldg., 1221 Michigan Ave.

Janssen, Orey, Rock Island, Ia., has sold his Ford automobile agency to Wm. Klockau of the same city.

Morrison, McIntoch & Co., Grinnell, Iowa. Mr. McIntosh has retired from the firm, and the business will hereafter be conducted under the name of Morrison-Ricker Mfg. Co.

Rainier Motor Car Co., Broadway and Fiftieth St., New York City, moved to larger quarters on the corner of 58th St. and Broadway.

Stebbs Automobile Co., West Seventh and Chestnut Sts., Chattanooga, Tenn., has been bought out by W. H. Burke, of the same city, who will continue the business there as formerly.

Terre Haute Automobile Company of Indianapolis, Ind., has changed its name to the Chaney Automobile Company.

Watkins, F. M. Mfg. Co., Sixth and Baymiller Streets, Cincinnati, Ohio, was recently incorporated under the name of the Watkins Motor Works Co., with a capital stock of $10,000.

West Haven Motor Co., The, Hartford, Conn., has filed a preliminary certificate of dissolution.

Legislative and Legal

NEW YORK.

Albany.—A bill was recently introduced at Albany, N. Y., to prevent motorists from escaping after running down persons, on the public highways. After an accident, failure on the part of the operator to give the name and address of the owner of the car, either to the injured person or to the first officer to arrive, is made a misdemeanor.

OHIO.

Toledo.—Hereafter arrests for speeding and subsequent fines must be made under the State statutes only, as the city ordinance was recently declared invalid.

BUFFALO'S AUTOMOBILE TAX ILLEGAL.

Buffalo's obnoxious automobile tax ordinance, which has been strenuously opposed by the Automobile Club of Buffalo, received a death blow on Jan. 8th, when the Appellate Division upheld Judge Hodson's decision, in the Dai H. Lewis test case instituted by the club, that the tax was contrary to the state law. The point was made that the local ordinance conflicted with the State act in that it resulted in a double tax.

AUTOS OBSTRUCTING STREETS TO BE SEIZED.

New York,—William Robbins, general superintendent of the Department of Street Cleaning of New York City, in a letter to his district superintendents, instructs them to warn all garages that automobiles obstructing the streets will be taken in charge, as the law compels their seizure by officers of the department.

Hosted by Google

At the meeting of the Executive Committee of the A. C. A. eld in New York January 7, 1908, the report of the Legislative Board by Charles Thaddeus Terry, covering the progress f the last two months was made.

The bill for a uniform Federal Automobile Law was reintroduced on the opening day of the present session of ongress and is known as House Bill Number 428. It was eferred to the Judiciary Committee of the House The gitation for more reasonable State laws concerning autonobiles by the passage of a proposed uniform State motor ehicle law appears to be bringing results in most of the tates, but the uncomprehensible attitude of the authorities f the State of New Jersey is a disagreeable feature. The eport states in regard to the two objectionable New Jersey aws; "There are no arguments to sustain their position in upport of the obnoxious laws on their statute books governng automobiles, except the frankly-confessed one that it rovides revenues, and the remarkable part of the situaon is that they consider that argument all sufficient."

Miller's New Vulcanizer Factory

The accompaning illustration is of the new uilding recently erected for Charles E. Miller f Anderson, Indiana, manufactuerer of Tire ulcanizers, etc. This new building has two tories above the ground besides a full size asement and contains a total floor space of

Chas. E. Miller's New Factory for the Manufacture of Vulcanizers

2,000 square feet. The entire building is evoted to Mr. Miller's business and is fully quipt with steam heating apparatus, elevator, ectric power and a full line of machinery for e manufacture of Miller Vulcanizers and for e repairing of automobile tires, which is also one in the building. The total cost of the uilding and grounds is $20,000.

We are informed by the Rushmore Dynamo orks, Plainfield, N. J., that in the suit against e Manhattan Lamp Works which has been ending for over a year, a sweeping injunction as granted by the decision of Judge Ray, gainst further manufacture or sale of imitaons of the Rushmore lamps, shells, rear vers, front doors and ventilators, and also gainst the use of the name "Flare Front" connection with searchlights.

Baker Motor Vehicle Co. comes as a sko his numerous friends in the trade in whi has been an active worker having bee executive officer of the N. A. A. M. and T urer of the Association of Electric V Manufacturers.

While driving to his home, he got out car to recover his hat. After allowing a car to pass he stepped directly in front automobile, was knocked down and run but was apparently not seriously injured. drove his car home and complications did set in until the third day and on the f he died. He refused to state who ran him and entirely exonerated the driver.

He leaves a widow and a daughter, Geo. Beach, and a son Ralph H. Goss.

Savannah Races

The announcement has been formally by the Savannah Automobile Club that two days' racing carnival in the suburb the city of Savannah will be held during week of March 15th. The races will co of, first, an event of approximately 300 over an 18-mile course and, it is unders there will also be two short distance r For the greater event there will be a chall trophy given by the City, valued at a $2000. Arrangements have been made the state of Georgia, whereby there wil 1200 troops of the National Guard to p the course. In addition, all cross roads be fenced off and the entire course will be

The complete route for the automobile from New York to Paris, to start from T Square within a month, has been defin fixed and is officially announced herewith each stage of the notable journey. It invo a total distance of 20,000 miles, nine-te of which is on land under power of the testing cars alone. Two thousand

Hints on Care of Tires

BY WELL-KNOWN MAKERS.

Much of the trouble experienced with automobile tires can be avoided if proper care is taken and in most cases this care is not exercised, simply because the user is not familiar with tire construction and is not posted as to the best methods of caring for these expensive and all important parts of the car. For the benefit of our readers, that they may have the minimum of trouble and the maximum of wear from their tires, information was solicited of the well known tire makers and this first hand advise has been embodied in this article.

As many are now laying up their cars for a few months the following general remarks on the treatment of tires during this period may be of advantage.

STORING AND HOUSING OF TIRES.

If the car is in frequent use it is better to leave the tires inflated, however if the car may remain for some time without being used, it is a good plan after having placed jacks under the axles, to let the air escape. In any case, care should be taken that the car does not remain in the motor house with deflated tires unless jacks are under the axles, for the rims pressing on the rubber of the covers will seriously damage them.

Never leave the covers in a damp place or the canvas will soon get rotten and nothing can then be done for them. Do not forget that the same causes which make iron rust, will prove injurious to canvas.

If it is certain that the tires will be out of service for some time, the best plan is to deflate and take them off the rims, and carefully wrap each one separately in a moisture proof covering. The tires should then be laid out *flat* in a dark, dry place with an even temperature of from 40° to 65°. Rapid changes of temperature are bad for tires and being laid out flat will prevent their warping or getting out of shape. Never hang or stand a tire up if it is possible to avoid it. Some advise, putting them in a tight fitting box with a saucer of turpentine in the centre of it, as this it is claimed, prevents the sulphur incorporated in the rubber by the vulcanizing process, from hardening the rubber. It should be remembered that oil, grease, and long sustained heat are very destructive to rubber, causing disintegration, hence the surface of the tires should be kept free from these. Light will result in oxidation of the rubber causing it to break and crack. A cool dry place not directly exposed to light is therefore the best for the storage of tires.

Before putting the car into commission in the spring, it will be well to look the tires over carefully and also see that the rims are in good condition.

The rims should be examined occasionally, the rust removed with emery paper and a coat of lacquered varnish applied as rusty or rough rims often cause much damage to tires.

One of the chief causes of tire failure according to Morgan & Wright, Detroit, is due to the missuse which tires receive owing to the lack of knowledge of tire construction on the users part. This company states, that users should thoroughly understand the detrimental effects produced by unnatural strains on automobile tires, therefore the general method of tire construction is given.

The principal materials entering into pneumatic tires are long staple cotton and rubber. The former is specially woven into fabric of great tensile strength. Tread stock, friction stock, tube stock, etc., are each distinct compounds, each formula being determined to meet an end. The strength of a tire is contained in its fabric, while the rubber acts as a binder, a coating to keep out moisture, and to prevent the fabric from direct wear. All fabric is cut on the bias, hence there is a high degree of mobility, and it thus readily takes the desired shape, also equalizes the strain on the several threads. We all know that a thread will easily cut another if there is a sawing motion. To meet this natural process the fabric is coated on both sides with rubber, which process is termed frictioning and the resulting fabric is known as friction stock.

The body or carcass of a tire is built up of several layers of frictioned fabric, and when the carcass is vulcanized the friction rubber thoroly encapsulates each individual thread, and also welds together the several plies. If the tire has been properly built, good material being used, there is no danger of separation of the plies under proper care. Rubber being waterproof, the outer surface of a tire is coated with extra rubber for two purposes. First, to give additional wearing material to take the abrasion, and, secondly, to keep water from the fabric or body proper. We cannot emphasize too strongly the necessity of keeping moisture from the fabric. Small cuts and punctures allowing water to get in, lead to rapid destruction. Therefore they should be given prompt attention.

SELECTION OF TIRES AND APPLICATION TO RIMS

In regard to the selection of tires and the method of applying them to the rims the Empire State Tire Co., Buffalo, N. Y. call attention to the fact that at the very outset, the purchaser of a new car should give his attention to specifying tires of the proper size and become familiar with the manner of executing emergency repairs. The automobile manufacturers, in the past year have found it advisable to supply larger tires,—the increased

Hosted by Google

mileage and general satisfaction more than justifying the additional expense.

There is some variation in the schedules of weights which the different tire manufacturers guarantee their tires to carry and while the following table has not been adopted, it is generally approved:

MOTOR CAR TIRES.

Dia.	Maximum Weight the Tire can bear.	Load on each tire.	Pressure per square inch required.
2½"	600 lbs.	340 to 400 lbs. 440 to 600 lbs.	50 lbs. 64 lbs.
3"	480 lbs.	330 to 440 lbs. 440 to 480 lbs.	50 lbs. 57 lbs.
3¼"	660 lbs.	440 to 550 lbs. 550 to 660 lbs.	71 lbs. 64 lbs.
3½"	990 lbs.	550 to 770 lbs. 770 to 990 lbs.	57 to 71 lbs. 71 to 78 lbs.
4"	1140 lbs.	660 to 990 lbs. 990 to 1140 lbs.	57 to 71 lbs. 71 to 78 lbs.
4¾"	1320 lbs.	880 to 1100 lbs. 1100 to 1320 lbs.	64 to 71 lbs. 71 to 78 lbs.
5¾"	1490 lbs	1100 to 1430 lbs. 1430 to 1650 lbs.	71 to 78 lbs. 78 to 85 lbs.
6"	1650 lbs.	1100 to 1430 lbs. 1430 to 1650 lbs.	71 lbs. 85 lbs.
2-PASSENGER TOURABOUT.			
2½"	375 lbs.	220 to 300 lbs. 300 to 375 lbs.	35 lbs. 43 lbs.
3"	375 lbs.	220 to 300 lbs. 300 to 375 lbs.	35 lbs. 43 lbs.
3¼"	480 lbs.	330 to 390 lbs. 390 to 480 lbs.	43 lbs. 50 lbs.
2-PASSENGER RUNABOUT.			
2½"	220 lbs.	110 to 175 lbs. 175 to 220 lbs.	28 lbs. 35 lbs.
3"	260 lbs.	110 to 175 lbs. 175 to 260 lbs.	28 lbs. 35 lbs.
3¼"	300 lbs.	130 to 220 lbs. 220 to 300 lbs.	35 lbs. 43 lbs.

For weights exceeding 1,000 lbs. per wheel, 5 inch tires or over are recommended.

PUTTING ON THE TIRE

As there are so many styles of rims on the market, both regular and quick detachable, and different methods of application recommended by respective manufacturers, it will not be advisable to outline any particular instructions in regard to the manner of assembling, further than that which will apply generally. To apply any regular clincher tire to the rim, it is the quickest and safest way to first lay the outer case flat on the ground and in it place the inner tube, inflating same just enough to round it out nicely to prevent pinching by the clips or tire tools. Now, the clips having been placed in position in the rim, the tire should be fitted to the flange of the rim toward the car by lifting up the bead with a tool to permit the clips to adjust themselves. Then, starting at the valve, force the outer bead of the case over the flange of the rim and secure same by pulling the valve out as far as possible and tightening it with washers. Working toward the right, push the bead in position all around the rim, holding the clips up in the tire. Be sure that they work freely and do not pinch the inner tube,—then the tire is ready for inflation.

INFLATION

New tires, after being used a short time, assume a larger volume due to the stretching of the fibre in the fabric, therefore they should be reinflated after a service of a week or ten days. To increase the resiliency, the tires are quite often abused from under inflation. The separate plies of fabric or canvas of the tire do not pull together uniformly when soft and a separation or breaking will occur due to the friction produced from the resulting activity. Some tire manufacturers recommend a schedule of pounds for inflating each size of tire but, considering the effects of climate, speed at which the car is driven, weights to be carried and numerous other equally important conditions, it is best to use a more flexible rule, —therefore inflate any size tire, under a weight which it is able to carry, to a pressure that will cause the tire to round up nicely and, if the fabric or canvas is in good condition, this volume from expansion on a long drive or hot day will not cause ruptures or blow outs. If a tire should become very soft at any time, it is probably due to a leak in the splice of the inner tube, small puncture, rupture in the fabric or similar injury and the tire should immediately be removed from wheel and examined carefully to make sure that there is no puncturable object in it which of course, if not removed, would injure any number of tubes that might be put into the case, causing no end of annoyance. Small ruptures in the fabric, resulting from stone bruises or other causes, are sometimes quite difficult to discover and it is time well spent to make a thorough examination.

It seems that there is some fear on the part of the novice of bursting the tires by inflation and he, as a result, goes to the other extreme. When tires are not well inflated, the beads do not fit the rim snugly and quite often the inner tube is pinched.

TIRES RIDDEN SOFT OR DEFLATED

For runabouts and touring cars, it is generally conceded that the pneumatic tire is preferable over the solid because of its resiliency, ease of operation and its quick and simple method of repair, however, all pneumatic tires are susceptible to punctures and other injuries which, if not given the proper attention, result in a soft or deflated tire. The user, quite often through an ignorance of the technical construction or probably from an indifference to the result, will ride the tire a considerable distance deflated, to find later

Hosted by Google

that some injury has been done necessitating quite an expenditure for repairs, sometimes rendering the tire unfit for further service. Altho it is not always convenient to make repairs or replacements with an emergency tire carried for that purpose, it is beyond doubt advisable, in view of the injuries that will probably otherwise occur.

The injuries resulting from a soft or deflated tire are equally bad. A soft tire may result from a worn valve plunger (valve inside) or from a patch not properly applied or vulcanized. The heat, from the increased activity of the tire when soft, dries the adhesive properties of the fabric or canvas and starts a separation after which, from the uneven strain assumed from one ply by another, chafing occurs and the friction wears through the threads,—a complete blow out sometimes occurring. Of course the tires ride much easier and are more resilient when ridden soft because they easily pass over obstacles and in this way the vibration of the car is absorbed by them, but, as the automobile manufacturers, in the last year, have materially improved this condition by adopting springs calculated to relieve the tires as well as the mechanism of the car from vibration, there is not much excuse for riding the tires soft and it will be conducive to their longevity if inflated so that they do not belly under the weight of the car, passengers, baggage, etc. From riding the tires deflated, the beads of the case are cut and torn due to chafing by the rim which is often rough and irregular from bumping over obstacles in the road and unless given attention, will injure every perfect tire that may be applied to it thereafter. Even when ridden deflated for a quite a distance, the tires may appear from an examination of the outer surface of the case to be practically uninjured, but the fabric or canvas which is of most importance to the life of the tire, has been bruised, cut or otherwise injured or the inner tube may be cut in places by the clips or by chafing of the beads of the case. Sometimes it is more convenient to apply an "emergency band" to a case that has blown out. To do so, remove one side of the case from the rim, patch the inner tube, place a reinforcement between the inner tube and rupture in the case and assemble the tire on the rim. Then apply the emergency band directly over the blow out, lace tightly and inflate to proper riding pressure.

SKIDDING

Excessive wear to the tread of the tire results from rounding corners quickly, turning sharply on wet pavements, driving in car tracks, or by stopping the car suddenly by a severe application of the brakes. In every instance, the tires receive an unevenly proportioned strain, causing injuries to the fabric and premature wearing out of the tread from the grinding effects. It is difficult to secure traction when starting the car quickly on a wet street or sandy road and a slewing or grinding of the cover will occur from the wheels spinning round.

CUTS IN THE TREAD OR COVER.

A cut in the fabric, when that part of the tire is under the weight of the car and in contact with the road, has a tendency to expand, owing to the elasticity of the rubber, and foreign matter forces itself into the cut. When the injured part is relieved from the weight of the car, this matter cannot be released, owing to the contraction of the rubb r, and with each revolution of the wheel it acts as a wedge and further forces itself between the cover and fabric eventually causing, if neglected, a complete separation. In many instances necessitating an entirely new cover. When cuts are neglected the fabric absorbs moisture which is detrimental to the adhesive properties, causing mill-dew and disintegration, invariably resulting in a blow out.

The following instructions are from the Michelin Tire Company.

INFLATION MOST IMPORTANT

The tire should always be sufficiently inflated to prevent any obstacle from ever touching the rim, even when driving over cobble stones. Owners should see to it that their cars are not moved around the garage or motor house either by hand or under power with deflated tires as this apparently harmless proceeding is often responsible for tires becoming prematurely weak.

The air pressure in the tire must be proportioned to the weight it has to support and for this reason drivers are advised to weigh their cars carefully and to inflate their tires according to the table appended herewith, showing the maximum weight Michelin Tires can bear and the pressure required.

Size.	Weight per wheel.
28 to 36 x 2½	225 lbs.
28 to 36 x 3	350 "
28 x 3½	400 "
30 x 3½	450 "
32 3½	550 "
34 and 36 x 3½	600 "
30 x 4	550 "
32 x 4	650 "
34 x 4	700 "
36 x 4	750 "
32 x 4½	700 "
34 x 4½	900 "
36 x 4½	1000 "

PROPER INFLATION DETERMINED BY FLATTENING

Whether the tire is properly inflated or not is shown by the extent to which it flattens. When the car is loaded the tire should flatten about $\frac{2}{5}$ of an inch, but should never under any circumstances, be depressed more than $\frac{3}{5}$ of an inch.

It is by means of the breadth of that part of the inflated tire which comes in contact with the ground and which under the rolling takes a special aspect, that one can tell whether the tire is well inflated or not. This breadth

Hosted by Google

should not exceed about 1-½ inches for 2-½, 2-½ inches for 3-½, and 3 inches for 4-½ to 5″ tires. Do not be afraid of bursting the tires, for most pumps are not capable of exercising a pressure of more than 170 lbs. per sq. inch and good tires can stand a pressure at least equal to that. Beginners are always afraid of inflating the tires too much with the result that they rarely inflate them enough.

SUMMER AND WINTER INFLATION PRESSURE

All other conditions being equal, tires should be inflated to an equal pressure for summer and winter. At any given pressure a tire will contain more air in winter than in summer. This is owing to the greater density of cold air. But as it is pressure and not quantity which effects a tire, summer and winter pressures should be the same at the start of any run. To secure the best results however, the difference of temperature between summer and winter must be taken into consideration. Owing to the higher temperature in summer, the heat generated by the kneading of the tire walls (when in service) will not be dissipated nearly so quickly as in winter. This causes the tires to become hot very rapidly (especially in fast running) the heat is absorbed by the compressed air thereby causing considerable expansion. It is not uncommon for a brisk run with a heavy car in warm weather to raise the pressure 10 lbs. Turning corners, at high speed is bad at all times but especially injurious to tires under the conditions above mentioned. For this reason, as soon as tires have had sufficient exercise in summer to become thoroughly hot, the pressure should be taken with a gauge and enough air let out to reduce the pressure to normal, care being taken however, not to deflate the tires too much.

HOW TO LOCATE THE TROUBLE

If on the road the inner tube leaks the trouble is due to one of the following causes:—Puncture by a nail or other article. Blowout through either pinching of the inner tube or defective casing. Leakage of the valve plug. Leakage of the valve cap. Leakage at the junction of valve with tube.

The usual precautions should be taken to see that the inside of casing is free from foreign substances, the trouble when found should be attended to in the usual way and it can be located as follows:—

Leakage of the inner tube through puncture usually makes itself known at the time it happens by a hissing sound, greater or less according to the size of the puncture. In the most frequent case, that of a nail, the noise of the running car often prevents the hissing being heard and the tire does not become deflated for several hundred yards. When it is quite flat however, there will be noticed an appreciable difference in the softness of the car's running. It is absolutely essential that the car be stopped as soon as possible and the puncture repaired. Remove the inner tube in whole or part from the casing and if you cannot immediately locate the trouble, proceed as follows:—

Slightly inflate the tube, you will then be able to locate a puncture by the stream of air produced in the dust or against your cheek. Always see that there are not two punctures in the tube. Imperceptible leaks, for instance those made by needle-puncture, which empty a tire in two or three days may be discovered by plunging all the different parts of the inflated tube into a bucket of water and stretch it so as to dilate the puncture. Only then may air bubbles be seen rising to the surface of the water. Instead of plain water soapy water can be used as this indicates the trouble more clearly.

In looking for punctures the inner tube must not be too highly inflated for a bulb would form at some part in which the excess of air would lodge itself. In such a case deflate your tube at once if you do not wish to see it burst. Pure rubber cannot resist the pressure; this is done by the cover which is lined with canvas. The swelling is a proof of the excellent quality of the rubber employed for tubes; rubber of inferior quality would burst without swelling.

Always examine the casing carefully inside as well as out before replacing the inner tube to see that the article which caused the puncture is removed, for if it remains, the tube will puncture again before you have travelled 300 yards.

It is impossible to repair a blowout of the inner tube satisfactorily on the road. The tube should be returned to the makers for repair and an *old* tube carried with you for the purpose, inserted instead. This applies where you have to patch up the blown out tire, as it is unwise to put a new tube in a casing which may give out again.

(*to be Continued.*)

Every automobile dealer should be sure to secure a copy of the March number of the Cycle and Automobile Trade Journal, as it will be the eighth annual complete vehicle number, containing illustrations and specifications of every 1908 model produced by American automobile manufacturers. It is in compact form for ready reference, with proper indexes. It is invaluable to dealers, as it keeps them posted on the machines handled by their competitors, and also gives them information where to look for additions to their line which would not conflict with those they already have.

liam R. Hines, Chief Plant Engineer, nal Screw and Tack Company, Cleveland, U. S. A., an engineer of wide experience, d his attention to mechanical traction 01 and built his first car, a rear-entrance au-body with seats for four passengers, 02. The motor was a single 4-cycle cyl- 5x6 ins. This was a heavy car, 2000 r over and after about a year of driving Hines changed the motor to a 6x6 ins., e single cylinder. This new 2-cycle made the Hines car a strong hill-climber ave it about 35 miles an hour on a good The performance of the motor was ctory, and convinced Mr. Hines that the e motor was superior to the 4-cycle for iving.

the Hines motors have been very strong on throttled charges, where the small port-area is ample for the passage of the decreased charge volume.

In this same year, 1906, Hines was called upon to give more power to the car of an acquaintance, and built a motor with two of these same 2-cycle 4½x4 in. cylinders. This car was light, 1500 lbs. or so, surrey body to seat 4 passengers. This motor gave abundant power for bad roads and hill-climbing, with about 35 miles on good roads. All the Hines motors give maximum power at about 700 R. P. M., and make their cars strong in slow work though not very fast with 3½ to 1 gear because of the limited port-area. Mr. Hines believes that the limited port-area is con-

1. Hines 2-cycle 5-passenger touring car. Wheel-base 106 ins., gauge 56 ins., tires front 30x3½ ins., rear 32x4 tor, four-cylinders, 4½x4 ins., 2-cycle, water-cooled, crank-box-pressure charge-supply through carburetor. Sliding orward speeds and a reverse to bevel gear and full floating rear axles. Front and rear wheels and bevel gear are all en rollers. The gear box bearings are hardened steel for both line-shaft and side shaft. Plain cone-clutch, leather springs under clutch-cone leather, 5-passenger tonneau body. Weight of car about 2650 lbs. as here shown.

next attempt of Mr. Hines took the f a 3-cylinder 2-cycle motor, cylinders ns., nominal 24 H. P., which he placed Brew-Hatcher 5-passenger car, total 24 or 2500 lbs., 30 inch wheels, geared , making a very strong drive in mud and s, with about 40 miles on a fair road.

906 Hines built a second 3-cylinder 2- motor, cylinders same dimensions, 4½x4 aking a change in the throttling and it in the same Brew-Hatcher car. This 3-cylinder 2-cycle motor was much built than the first one and gives a better on throttled charge, though the same

ductive to fuel economy, and for that reason makes his ports as shown in the drawings reproduced herewith.

The successful operation of the one, two and three cylinder 2-cycle motors made Hines certain that the 2-cycle was the right thing, and early in 1907, he built a four-cylinder, 2-cycle motor, same 4½x4 in. cylinders and placed it in a chassis built by himself, 106 ins. wheel base, tires 30x3½ ins. front and 32x4 ins. rear. Same wheels front and rear, but fitted with special rear tires to give the 32 ins. diameter. The reduction ratio from crank chaft to drivers was made 2½ to 1. Both axles are

Google

Fig. 2. Hines 2-cycle-motor-driven, 5-passenger touring-car. The intake pipe from carburetor is on the ri side and the exhaust pipe is on the left hand side, thus keeping the heat away from the charge supply and giving reac bility. This illustration shows the low placing of the motor, although the connecting rods are 8 ins. center to ce strokes in length. This car has been driven without mercy, and the tires show hard usage.

no repairs and no changes except to try different lining metals for the crank-wrist ends of the connecting rods.

The 16000 miles of road work of the 4-cylinder Hines touring car has included five round trips between Cleveland and Buffalo, 210 miles apart, one run to Wales Center, N. Y., and return, 450 miles, and a round trip Cleveland—Pittsburg, 160 miles with return by way of Greenville, Pa., 215 miles, round trip 375 miles, and a week on the road to Wheeling, West Va., and return, 1000 miles total. The remainder of the 16000 miles has been made in daily runs out of Cleveland and return, and in the course of business, but all with the view of trying out this 4-cylinder, 2-cycle motor so fully and thoroughly that there could be no doubt whatever as to power, reliability and moderate fuel-consumption.

This car weighs with two passengers 3000 lbs. and a run from Pittsburg to Cleveland, carrying two passengers, 160 miles, was made in 8½ hours with 13 gallons of gasoline, a little better than twelve miles to the gallon at nearly 20 miles an hour for the total elapsed time from start to finish, much of the way over bad roads.

From Cleveland to Wales Center, N. Y., 225 miles, 4 passengers, weight about 3400 lbs. was made in 10 hours and 10 minutes, first stop at Westfield, N. Y., 143 miles from Cleveland, with 15 gallons of gasoline Cleveland to

of fuel, but on the contrary gives a lar tance per gallon and a large ton-mile a

One argument advanced by 4-cyc vocates is fuel economy, and the other claim is for motor flexibility. How 2-cycle-motor-driven car known to the made over 31 miles to the gallon, bac forth over a 6¼ mile clay road course, inders, total weight of car and pas 1910 lbs., the writer's own observation.

These Hines car runs show far bette the average 4-cycle motor results in f onomy, while the 4-cylinder Hines motor is everything that could be ask in the way of flexibility and sensitive re to throttle regulation.

To meet constant inquiries regardin cessful 2-cycle motor practice, complete ing drawings of the Hines cylinder are with all important dimensions. It m borne in mind that the small port area the motor speed down, so that the motors show maximum power at abo R. P. M.

The writer has no doubt that the cylinder is over-cooled and under-porte as these motors show extremely well road, this car having made 16000 mile absolutely no engine repairs, the c drawings are of very great value, an doubtless be carefully studied by all J readers who are 2-cycle investigators.

THREE CYLINDERS OR FOUR CYLINDERS?

Mr. Hines is now placing his 3-cylinder motor, same 4½x4 ins. cylinders, in a runabout, with a view to trying out the 3-cylinder 2-cycle motor as thoroughly as this 4-cylinder motor has been tested and camparing mileage results with the 4-cylinder performance.

Unquestionably, the car buyer is more interested in the actual road work of his car than in any laboratory tests, no matter how complete and indisputable they may be, and Mr Hines has taken the sure way of driving cars with one, two three and four cylinder motors, over long distances and under all conditions to satisfy himself as to what is really the best number of 2-cycle cylinders for use in automobiles: the choice lies between three cylinders and four cylinders; the four-cylinder performance as here detailed is excellent, far better than that of the ordinary 4-cycle motor, and it will be interesting to note the comparative performances of the three and four-cylinder motors, all cylinders exactly the same.

ON THE ROAD.

The writer made a number of short runs on Cleveland pavement, Mr. Orion Alexander always driving, and one run of 51½ miles, Friday, January 3, 1908. All of the runs were made on Cleveland pavement, the condition of unpaved roads being such as to prevent any instructive demonstration.

For the 51½ miles run of Friday the fuel tank was filled near Willson Avenue, and then driven to the park on the Lake Shore, west side, where pictures of the car were taken. Then the car was driven to the East side and sent over the whole length of the Euclid Ave. pavement three times, and then back from the eastern end of the pavement to Woodland and Willson avenues, 51½ miles in all, when the gasoline tank was refilled with 4½ gallons of gasoline, showing 11 $\frac{1}{9}$ miles to the gallon. The car weighed before starting, with two passengers and a full tank, 3060 lbs. Part of the distance a third passenger, weight 150 lbs., was carried.

Fig. 5. Hines Cylinder working drawings reproduction, vertical section, horizontal partial section and elevations. This illustration is given with the most important dimensions and inscriptions.

Fixing the average total load at 3060 lbs., distance 51½ miles and fuel at 4½ gallons the ton-mile duty was 17½ miles to the gallon, which is very good for a level course where the motor has to work every foot of the way.

The run was almost all in city streets, with some full stops and a great many slow-downs, while the whole run was made on a restricted course, 15 miles speed limit. The slow downs and stops and rushes to take advantage of openings for passage, caused, probably, at least 20% higher fuel consumption than if the course had been over an equally good surface with nothing in the way.

Fig. 6. Hines Piston, lengthwise section, reproduction of working drawing with all important dimensions. The deflector form and placing are notable, because this Hines motor appears to waste no fuel. Note 1½ in. opening for charge passage in the piston wall, shown dotted.

Hosted by Google

The car was at all times under perfect control, Mr. Alexander having driven it many thousand miles and handling it with entire confidence, and was extremely handy, while the abundant power enabled the driver to take instant advantage of every opportunity

The car is on "Perfection" Quinn Springs, and rides very easily in the tonneau as wel. as in the front seats. As there are always two cylinders working there is no vibration at any time. The motor is absolutely silent and this Hines car is one of the best ever seen by the writer, as its 16000 miles performance with no repairs conclusively proves.

Fig. 7. Hines Crank-shaft, working drawing reproduction. The cranks are in two groups of two cranks set 180 deg. apart in each group, the two groups being set at 90 deg. to each other. The firing order is 1, 3, 2, 4.

The crank-wrists are 1¾ ins. dia., journals 1⅝ dia., wrists ⅛ larger dia. than journals, reversing usual practice where wrist and journal diameters differ from each other. Hines increases the wrist diameter, not to obtain crank-shaft torsion resistance, as a wrist of same diameter as journal is larger than torsion resistance demands, but to obtain a larger diameter wearing surface for the crank wrist and rod-end.

Our Eighth Annual Complete Vehicle Number

The chief feature of the March number of the Journal is the complete vehicle review included in its pages. This complete vehicle review constitutes one large section of the March Journal and consists of summaries of specifications and illustrations of each model of every make of American motor cars. This summary, appearing as it does in advance of the buying season, is of incalculable value to the trade and prospective car purchasers as a guide in making selections, and comparisons. Every yearly subscriber to the Journal i ssure of getting a copy of the complete vehicle review, but transient readers should assure themselves of getting this valuable number by subscribing at once. $2 pays for the Journal for a whole year and if sent promptly will assure your receiving the March Journal containing the eighth annual complete vehicle review. Send remittances to the Cycle and Automobile Trade Journal, 49th and Market Sts. Phila.

Harrisburg Club Run

The contest committee of the Motor Club of Harrisburg is now preparing for the club's second annual endurance run, which will be held on May 4–5, 1908. The route selected leads thru Lebanon, Reading, Kutztown, Allentown and then to Philadelphia on the first day, where the stop over night will be made. The return will be via Norristown, Pottstown, Reading and Lancaster.

The contest will be a sealed bonnet affair and all engines must be kept running at all times except where the laws of the road require a stop. After the run all cars will be examined by a technical committee.

School for Automobile and Carriage Body Drafting

A school for instruction in the design of vehicles and the making of working drawings and fashion plates of them, was opened in New York City in 1880, with evening classes only. It grew until in 1892 a day school was added. Recently Andrew Carnegie donated half a million to it and it is now housed in a splendid building with large library at 20 W. 44 St. and is one of the most complete schools of its kind in existence, there being several abroad but no other in the United States.

It is open to men employed in the automobile or carriage building or accessory trades and is entirely free. A correspondence department is open the entire year while the regular school has a Fall term, October to Xmas and a Winter term, January to the last of April. The school is now a part of the Mechanics Institute under the auspices of the General Society of Mechanics and Tradesmen of the City of New York.

During 1907, according to figures compiled by Secretary of State Whalen, there were 13,980 owners registered and 9,386 registrations for chaueffeurs at Albany N. Y., against 11,649 owners and 7,335 chauffeurs in 1906.

On February 8th to 12th, inclusive and again on February 29th to March 4th, inclusive, merchants' reduced rates to New York will be in effect from Central Passenger Territory, as arranged by The Merchants' Association of New York. The rate, as heretofore is authorized on the certificate plan, the return limit, including the date of the sale of the transportation, to be thirty days.

This year, as in previous years, the entire output of the Elmore factory is pledged and sold—with agents urging an increase of their allotment

Far and away the most active car in the American sales market today is the valveless two-cycle Elmore.

For five years it has been the steadiest selling car in this country.

These are positive effects due to a fixed and positive cause.

The stability and prosperity of the Elmore, past and present, has arisen primarily from the fact that it is a *two-cycle* and a *valveless* car.

The history of all four-cycle cars has been one of change and caprice in public choice—largely due to caprice and change and uncertainty in construction.

The history of the valveless two-cycle Elmore has been one of steady progression and steady popularity due to the gradual evolution of a fixed principle of whose correctness every Elmore owner has been enthusiastically convinced.

Thus, today,—no Elmore owner can be coaxed or coerced away from the Elmore. This is due to the riding and operating results he gets *because* it is valveless; and *because* it is two-cycle.

Owners of four-cycle cars may and do waver in their allegiance, change cars, become discouraged and abandon any and all four-cycle cars—the Elmore owner will remain supremely loyal because he is supremely satisfied.

After the Elmore two-cycle engine was perfected and all valves eliminated, only one thing remained to emphasize and widen the gap between the Elmore and all other cars, to wit: the ignition system.

In the 1908 car has been installed an ignition system substantially as amazing in its results as the action of the two-cycle engine itself—a system, for instance, which will run the car 2000 miles on one set of six-inch dry cells.

The paragraphs give you in the rough some idea why the sales of the Elmore are impervious to changing conditions which affect four-cycle cars—why we are inclined to bend a listening ear to the appeal of our agents that each and all of them be alloted more cars.

MECHANICAL AND TECHNICAL DEPARTMENT

EDITORS

Gasoline vehicles—Chas. E. Duryea, Consulting Engineer, A. M. C. M. A.

Steam vehicles—J. A. Kingman, Locomobile Co. of America, Bridgeport, Conn.

(We desire our readers to make full use of this department by asking our department editors advice on all subjects connected with motor cars. We will also grant full use of our columns to those who disagree with the views and opinions expressed in this department.)

NOTICE—Matter for the attention of the Editors of this department should be addressed to the particular editor it is intended for, care of the Cycle and Automobile Trade Journal, and must reach Philadelphia by the 5th of the month to insure insertion in the next number. (Special information on personal matters not for publication should not be expected without remuneration.)

Answers to Motor Cycle and Motor Boat inquiries will be found in those departments.

Gasoline Vehicles

PROPORTIONS OF AIR AND GASOLINE FOR CORRECT MIXTURE

SAN DIEGO.

Kindly answer through the Automobile Trade Journal, the proper proportions of gasoline and air to make perfect combustion for gasoline engines.—I. C. B.

I do not know. I have never tested this for myself and do not know where it is given by an authority that is to be relied upon. I answered this question in these columns some time back but have forgotten the result. One recent writer states that the varpor of gasoline must have 47½ volumes of air for proper combustion. Another states that gasoline vapor has a volume 130 times that of the liquid. If these two statements are true, then the proportion of air to liquid is 130 times 47½ equals 6175 to 1. My guess today is as follows: A full pint of fuel, (for easy figuring 30 cu. in.), will develop a H. P. H. At 1,000 ft. piston speed per min., an engine can deliver a H. P. for each 12 cu. in. piston displacement. Since, however, the piston makes three idle or non-sucking strokes to each sucking stroke it is evident that there are but 250 ft. of suction strokes in each minute, so 250 times 12 equals 3000 cu. in. per H. P. per minute, which multiplied by 60 gives 180,000 as the total volume of mixture per hour. Divide this by 30 and we have 6000 to 1 as the relative proportion of mixture and liquid. This does not take into consideration the fact that part of this is gasoline vapor, which is stated above as being more than $\frac{1}{130}$ but if we remember that mixtures are seldom perfect and that differing gasolines vary in their vapor volumes and that more than the amount stated is usually used, it will be seen that the results given altho corresponding closely are but ruff approximations.—C. E. D.

(We understand Tests on Mixtures have recently been made in the Laboratories of the Massachusetts Institute of Technology, Boston, as Thesis work and the results are open for inspection.—Ed.

DOES HE INFRINGE PATENTS

WAYNESBORO, PA.

I would like to ask a few questions in regard to build-automobiles. Do the manufacturers have to pay a royalty to any one, to manufacture machines of their own design? Would they have to pay royalty to use a transmission of the Lambert type or the Orient, with two disc and about what would the royalty be? Would heavy leather do as well as paper to cover the disc. RALPH FRUSHBORN.

The motor vehicle is so old that there are no basic or master patents. Every necessary detail is quite old and you can build without danger of infringing. There are, however, some patents on valuable details which certain makers are using and if you copy these you are likely to get into trouble. If you write any maker you may think you are likely to infringe and ask for a list of his patents you will usually get them and then you can ask a patent lawyer as to whether our construction is covered by the said patents or not. Many friction substances have been used and each seems to do well in its place but in some other place the result is often not so good. The Lamberts discovered and patented the use of aluminum as a friction disk metal superior to iron. Leather against iron is used with success and I recently saw tarred paper against iron.—C. E. D.

WANTS TO TAKE AWAY THE SMELL

CLEATON, KY.

If a gas engine cylinder is 6 in. bore by 7 in. stroke, what should be the size of intake and exhaust valve, and how many pounds per square inch compression should the engine have?

Has there ever been any way discovered to do away with smell of exhaust of gasoline engine so as not to be injurious or dangerous to work in same room, say exhausting in same room with a small portion of air circulating.

I have used limewater in exhaust or muffler, is there any other liquid or chemical that has been tried.—J. C. B.

Your letter does not give enuf facts about the engine to permit a valuable answer. The engine is probably not an auto engine and so not intended to run at such high speeds. It therefore does not need such large valves, and if on a heavy base with big fly-wheel and plenty of cooling water it may use a higher compression. The exhaust valve two inches in diameter or slightly larger will suffice and the inlet 1½ ins. to 1¾ ins. These sizes are at the inner edges of the seats. 70 lbs. compression is high enuf.

Both the man and the engine must have fresh air to breath. If you turn the burnt gas back into the room you both poison the man and stop the engine. You can condense the water out of the exhaust and the carbonic acid gas can be caused to unite with lime and be precipitated; but unless you supply fresh oxygen for both the man and the machine, there is nothing for them to use. The handiest and cheapest way is to exhaust out-of-doors and admit lots of fresh air.—C. E. D.

GASOLINE OR STEAM FOR AN AIRSHIP

WATERVILIE, OHIO.

Please tell me what engine you would recommend me to use for experimenting on building a flying machine and whether to use a gasoline or a steam engine and what style to use.—A. R. S.

I would recommend a gasoline motor by all means for aeronautic work. It leads the world for this purpose today. I have supplied a number of these motors in the past but am not in position to do so now and have not kept closely in touch with builders of them for some time, but feel sure you will make no mistake if you deal with the G. H. Curtiss Mfg. Co., who have made a number of such motors and advertise in our columns.—C. E. D.

HOW TO CALCULATE POWER TRANSMITTED BY FRICTION

SCHENECTADY, N. Y.

I have been studying the friction transmissions of the dozen or more runabouts and trucks that are just now being prominently exploited in the columns of the Motor Press, and have been unable to reconcile any of these constructions with engineering formulas for calculating the power and dimensions of friction. Several of these constructions at least appear to be successful but why? According to Prof. Goss of Purdue University, in a paper read before the A. S. M. E. and recorded in vol. 18 of the transactions of that society, the most economical working pressure of wheels is about 150 lbs. per inch of face and 250 lbs. about the limit practicable for paper or tar board pinions. For calculating the horse power that can be transmitted by a given wheel, he gives the following formula: D x W. x NX .000397, for 250 lbs. pressure per in. of face, where D equals diameter of driving pinion, W equals width of face, N equals number of revolutions per minute. Now if this formula is correct how can say 20 H. P. be transmitted by wheels within the limit of size practicable for any kind of motor vehicle and especially where the speed is to be greatly reduced, as well as transmitted?

According to my calcultions, using Prof. Goss's formulas the general run of friction drives will transmit only from 25% to 50%, at the most, of the power of the engine. If I am right, then why is it necessary to use, say an 18 H. P. motor when but 5 or 10 H. P. can be transmitted?

According to Prof. Goss the fibre wheel should always be used as the driver and the metal wheel as the driven wheel. Now in many cars this is reversed. Why is this? Has Prof. Goss's dictum been disproven or have more efficient and durable friction materials been produced?

In view of the prominence of friction driving at present, these questions seem to me to be pertinent and discussion of the subject would seem to be of general interest. If you can find space in next issue to answer these questions I should be pleased to have your opinion in regard to same and anything else you may have to say on the subject.—A. M. CASTLE.

I am not able to reconcile the formula you give with the facts. You do not state whether the diameter of the pinion is to be expressed in feet or inches. I suggest that you write to Prof. Goss and get his explanation. Possibly there is an error in the printing. If you do this, we will be pleased to publish the information you obtain, for the benefit of other interested readers.

In Kents pocket book, p. 905, is the following: H. P. equals the pressure at the point of contact times the velocity of the disks at this point in feet per second times the friction coefficient of the contacting materials divided by 550. This seems a rational formula. The width of contact should be as little as possible but must be enuf so that the pressure does not crush and destroy the material. A wide surface is less efficient than a narrow one if other things are equal, for the difference in the rates of speeds introduces a loss that increases rapidly as the line of contact is widened. On the other hand, a wide surface will require less pressure and so will make less friction on the bearings and similar parts and this must be looked out for. These friction drives are very fine if every thing is kept right but if the friction surface is allowed to get oily and the bearings a little dry, there may be as much or more friction at the bearings as at the disk contacts with the result that they fail to drive; and increasing the pressure only aggravates the difficulty. Then the operator gets mad and condemns the device and all of its kind.

Kent also says, "The value of the friction coefficient for metal on metal may be taken at .15 to .20; for wood on metal, .25 to .30; and for wood on comprest paper, .20." Also that "The tangential driving force may be as high as 80 lbs. per inch width of face of the driving surface but this is accompanied by great pressure and friction on the journal bearings." I have tried to make this as plain as possible that it may easily be understood by those less familiar with such things than yourself. In theory, the soft surface should be the driver for at starting it will slip on the driven surface and this grinds off the high spots, and keeps the surface true and circular. If the soft surface is the driven one this slipping will grind a flat spot on the driven wheel and make a rough and noisy wheel. In practice, the driver learns to set his wheels together quickly and there is always a little slack to the chain and similar parts so the driven one starts at once and while there may be some slipping it is distributed and hits the high spots hardest and so smooths up the surface and gives good results. Makers have found this out and fit up their vehicles in the manner that is handiest to them. It is usually easier to put a friction surface on the edge of a disk than a similar surface across the face of a disk and this is the reason so many makers do it. You can readily see that it might be difficult to get a piece of leather of equal thickness and hardness to cover the whole side of a disk but that this same leather, cut into strips and put around the edge of the disk, would not have all of its thin spots at one place.—C. E. D.

OFFSET CYLINDER IN OPPOSED MOTOR

FREDERIKA, IOWA.

Not having availed myself of the privilege of using your columns heretofore I would like to have you answer the following:

Is it practical to offset cylinders in an opposed motor? In a 5x5 would ⅝" be too much offset? Would the accompanying drawing be all right for crank shaft? If not what changes would you suggest? I wish to "hook up" two well known cylinders that have never been made opposed to my knowledge.

I am not a mechanical draftsman but think I can make myself plain. The offset in the crank shaft is to economize in space; bring the cylinders in a more direct line, also give direct thrust on piston and connecting rod also crank pin without using offset crank bearings.

What should the fly-wheel weigh for such an engine? Will not a low compression give less vibration than a higher one? I mean by low say 60 to 65 lbs. Would a radiator with 5 sq. ft. cooling be sufficient without a fan, with four gallons of water used.—C. E. CARR.

It is practical to offset the cylinders of any engine that does not reverse, but since an opposed motor is usually horizontal it is not considered well to have one cylinder tilted up at the crank end and the other down. Some other placing, as for example with the shaft vertical, would overcome this objection and be the proper thing to do. A good offset is ⅛ of the crank length so I would favor ¾ or ⅞ of an inch. The

crank sides shown are a little thin, but they will serve if quite wide the other way or if of stiff steel. You can bore an inch hole thru the pins with safety. It is not uncommon to overhang the crank pins as you propose and its only objection is the increased cost in making. The proper weight of fly-wheel is determined by the speed wanted. If it is to be run at a very low speed the wheel must be heavy. I would suggest an 18" wheel weighing about 80 or 100 lbs. A low compression will not only run smoother and start easier but will also give better torque or turning effort at low speeds. 5 ft. of radiating surface per H. P. ought to suffice without a fan. Much depends on the placing of the radiator, and on the condition of the engine. If there is no leak past the rings the cylinders will not get very hot.—C. E. D.

[The accompanying drawing and the statement that the offset will "bring the cylinders in a more direct line" indicate an intention to make the offset in a plane at right angles to the plane of swing of the connecting rods. Attention is called to the fact that the advantages of offset cylinders are only obtained when the offset is in the plane of swing of the rods.—Ed.]

WIRING A TWIN CYLINDER MOTOR

EAST ST. LOUIS, ILL.

Being a reader and subscriber of the Cycle and Automobile Trade Journal, I would like to ask the wiring of a two cylinder car.

I have drawn a sketch, and will mail you same, showing the location of the spark coil, timer, dry cells, and storage battery, and also ask that you draw the wiring on this sketch as I have drawn it out, so that I can wire the car from the sketch.

The switch is a three-way, and I would like to have it wired, so that one point of the switch comes from the dry cells and the other point from the storage battery. This seems to be the trouble with my wiring of the car.

MACHINE SHOP FOREMAN.,
East St. Louis & Suburban Ry.

I have moved the sketch of the switch down so as to make the wiring shorter and plainer. It is quite plain that the use of the switch is to turn on either battery, so connect them to it. You can swing the lever on to either one. Next connect the switch with the coil and since it must supply current to both it must connect to like wires of both and the handiest ones are the ones marked "ground." The other primary terminals must go to the timer so the proper coil may be in circuit and now you have only to ground the timer and other end of the batteries or connect them. The high tension or secondary wires must go to the plugs of course but if the timer is not grounded on the engine but is only connected to the batteries as shown, you will not get a strong spark, for the spark also needs a path and you must then supply one by grounding some part of the primary circuit since it seems evident the coil is wired with one end of the secondary wire attached to the primary grounds. It could be possible that one of the coil posts marked ground is for the high tension secondary current and that the switch needs only to be connected to the other. This you can tell by trial.—C. E. D.

TWO OR FOUR CYLINDERS, WHICH?

SEWARD, NEB.

As a subscriber, I would like to have a comparison between a two cylinder and a 4 cylinder automobile, the cost of either machine not to exceed $1,000.

I have operated a 2-cylinder and also a 4-cylinder machine, and am ready to buy the third, and am on the fence whether to buy a 4 or a 2-cylinder.

How much more real efficiency is there in a 4-cylinder than a 2-cylinder. Is not the "up keep" less in a 2-cylinder, than a 4-cylinder. Generally speaking, can you realize the same amount of power on hills and speed in a 2-cylinder that you derive from a 4-cylinder.

My experience seems to be that it takes more every day attention on a 4-cylinder than a 2 and adjustments must be made oftener on a 4-cylinder. What I want is a machine which is simplified, the "up keep" nominal and yet, I want plenty of power. To me, it seems easier in a 2-cylinder to keep both cylinders firing regularly than a 4-cylinder. Also that the battery consumption seems to be much less in the 2-cylinder. On the other hand, the gasoline consumption on a 4-cylinder seems to be the least.

My fancy dictates that I purchase a 4-cylinder, but laying aside pride, my common sense tells me the 2-cylinder will give less trouble. Your unprejudiced views will oblige.—W. E. LANGWORTHY.

You have exprest the situation so well that there is ittle need for me to say anything. If your standing n the community is indicated by the number of cylinders on your auto, then get all you can. This has been about the argument that buyers previous to this year have acted on. If value received, lots of service with little worry is wanted, then there are many people who believe a "one lunger" is best. This latter belief has received a strong forward impulse recently abroad where a lot of small single cylinder vehicles have been shown. I believe that the average man can carry his family with much under twenty H. P. and that there is no need to bother with a big overgrown affair when the light little rig will be handier as well as cheaper in every way and will be used more times per year with greater satisfaction. Large parties are the exception and when they occur you can borrow your neighbors rig or make two trips. The small rig can be driven by two cylinders without having them so large that they make a lot of noise and vibration and it is certain their parts will cost less than more parts of the same kind even tho slightly smaller. Therefore use the smallest number that will give the results wanted. This means a 2-cylinder for it is difficult to balance a single and over come the heavy impulses. Personally, I favor 3-cylinders for a 4-cycle engine for it is the least number that can be balanced and put into compact triplet form. The two cylinder must be of the opposed type unless it is a 2-cycle or has special balancing parts. More cylinders mean more friction, more oil and gosoline, more cost and the slight gain in flexibility does not compensate for the losses.—C. E. D.

PUTTING AUXILIARY PORTS IN OLDSMOBILE ENGINE

Would you please give me your valued opinion as to an auxiliary exhaust port on my 4-cycle Oldsmobile runabout engine, 1903 model; bore 4⅝ins. x 6 in. stroke. Where would be the best place to put it, in the bottom, side or top of cylinder? Would'nt the auxiliary exhaust at the end of the power stroke, help the power of the engine and also the speed? How big should this part be? CHAS. R. HALL.

You can doubtless improve the power at high speed by adding an auxiliary port as you propose, so if it is higher speed you need, this will be a good thing. Where the auxiliary port is used for the purpose of increasing the power you must be careful not to open it too soon but to keep it and the exhaust shut nearly to the end of the stroke so as to get as much power out of the gas as possible and then open both the port and the valve abruptly and let out the gas before the piston can return and make a back pressure. The size depends on the speed you can obtain on your roads. There is no use cutting ports for a higher speed than you can use or get. The safest way would be to cut and try till a size was found which further cutting did not improve. I would begin with four holes of 5-16 diameter placed at the end of the stroke so as to begin to open about 25 degrees ahead of dead center. These could next be filed triangular so as to offer more opening along the side first exposed. Put them on the bottom if convenient. They will carry off the excess oil here and not interfere with the lubrication so much as they might if on the side or top where oil is found less freely.—C. E. D.

WANTS HIS COIL TESTED

BOSTON, MASS.

I have a Rainier Model A, 4-cylinder car fitted with a La Cross coil and it seems impossible to time it regular, that is to say, when running engine to get the explosions correct. I lay the fault to the coil. Kindly let me know through your column how I can get this coil tested and to whom shall I go for same. Also what method would be used to test coil.—J. F. MANNING.

First be sure your batteries are strong. Many a man is sure on this point only to be mistaken. Substitute another coil and note the effect so as to be sure it is in the coil. Then, if as you think, return the coil to the maker or his agent, Leon Rubay, whose advertisement you will find in our columns. It is wise to write and get shipping instructions before sending it. The usual jump coil is too delicate for inexperienced hands to try to better. —C. E. D

Hosted by Google

WOOD TIRES FOR A RUNABOUT

DOVER, N. H.

I intend to make wood tires for my Cadillac Runabout for winter use. The tires used on my car are 28 x 3.

The wood tire is to be made up of blocks 1" thick, end of grain to the tread (see sketch). The blocks are to be sawed out on a hand saw, and tapered a little on a buzz planer by holding them in a form.

As shown in the sketch each block clutches under one side of rim. In making up the tire, one block is to clinch under the right side, the next under the left side and so on, every other block clinching under the one side and the others under the opposite side.

A steel hoop is to be clamped to each side of tire by bolts passing through the tire.

I intend using elm wood for the tires. Can you recommend anything better?

I do not intend to drive my car at high speed. Do you think these tires would be practical? Would they work all right on icy roads if chains were used? Do you know of any wood tires being used on a runabout?—GEO. WILLS.

Your wood tire certainly looks practical if one is satisfied with the slight resiliency coupled with the weight of such a tire. Wood tires are not new in theory, but I do not remember seeing one like yours. I do not think of any better wood than elm, which is both tough and elastic particularly when wet. You may have some trouble to hold the wood in place but this a trial will show. It may rim-cut and get full of sand at the rim, but a new tire need not cost much. I think it will have ample traction without the use of chains, for the fibres of the wood will pick up grit and will not wear smooth. I have never heard them being suggested for a light vehicle.—C. E. D.

TROUBLE WITH REAR CYLINDER

MADISON, S. DAK.

I would be much obliged if you will aid me in diagnosing my motor trouble, in your publication.

I have a 22 H. P., 2-cylinder, opposed motor in my car and am at a loss to understand why it "skips" lately. In cranking the engine it, in nearly every instance, runs very nicely; the motor when the car is standing still, running as evenly and slowly as could be desired. However, when I advance the spark and open the throttle slightly on starting, the rear cylinder skips for probably half a minute or a minute. Or it may run alright and when I engage the low speed it skips (always the rear cylinder) for a distance of about 20 to 40 feet. When the engine gets speeded up the skipping ceases. Or when I am running along on the high speed and open up the throttle, the engine again skips for a few moments and then runs normally again. At times, too, when I am running along smoothly on high gear there will be occasional skips, which, course, decreases the power materially. I notice that when this skipping occurs the vibrator of the coil vibrates just as regularly. I have taken the spark plug from the front cylinder and put it in the rear and still it acted as before. Have tried various spark plugs and gaps, but with no result. My battery is very good, being a storage and registering now somewhat over 6v.

Carburetor is O. K. I believe, for the front cylinder runs smoothly and intake for each cylinder is equidistant from carburetor pipe. Commutator must make connection O. K. or vibrator would not work when rear cylinder skips. Is it possible that there is a "short" in the coil for the rear cylinder that could only manifest itself occasionally? Would the vibrator still vibrate in that event? I have followed out the secondary wire carefully and can find nothing wrong there. The valves seem alright and the compression in both cylinders good.—H. H. F.

I think you are getting liquid gasoline into your rear cylinder. Change your secondary wires so as to use the coils on the opposite cylinders and see if the skipping goes to the front cylinder. You will of course have to change the timer wires also. I imagine that your gasoline is not so high grade as commonly you have used and that a lot of liquid gathers in one of the pipes and when you speed up even a little, it is drawn into the rear cylinder and makes the mixture therein too rich for several revolutions with misses. Shut the carburetor needle and see if this does not lessen the trouble. Bushing the carburetor pipe at the spray tube will make the air flow faster at that point and make a better spray and probably stop the trouble. Try these things and report for the benefit of the rest of us.—C. E. D.

EFFECT OF INCREASING THE DRIVING WHEEL DIAMETER

NEW YORK.

Kindly answer the following through the Mechanical and Technical Dept. of next issue.

I have a 45 H. P. seven-passenger touring car geared 3 to 1, with 34" wheels, and as this model is now being put out with 36" wheels am thinking of having mine so equipped, but, before making this change should like your opinion as to the advisability. Should also appreciate an answer to the following:

Would such a change make any particular difference in the "pull" of the motor, and would the ability of the car in heavy going or in climbing steep hills on 2nd or low be noticeably affected? If so could this be overcome by any changes in 1st and 2nd gears in gear set?

Are the results with 36" wheels and 3 to 1 gear so far as hill climbing on low or 2nd is concerned practically the same as 2½ to 1 gear with 34" wheels?—READER

The increase in wheel diameter will gear your car up $\frac{1}{17}$ and to restore conditions to their original ratio you will have to increase the large bevel gear or decrease the small one a similar amount. If you make a change in the gear box you will leave the direct drive higher than before and be obliged to change both of the other gears.

The effect of this gearing-up will be about the same as if you added $\frac{1}{17}$ of the present weight of the vehicle and load to the present weight; and this method of finding out if your motor will handle the car properly under the changed conditions will probably be close enuf for practical purposes. The gear change you suggest is $\frac{1}{3}$, or more than three times the wheel change, but may be an improvement.—C. E. D.

HOW TO TIME A 4-CYCLE MOTOR

BROOKLYN, N. Y.

Will you kindly send me a list of different cars and brakes or different gears. Also proper way to time a 4-cycle motor. HOWARD VAN DEWATER.

In the March issue we will publish a list of practically all American cars with specifications covering the number and kind of brakes used on them. This will include the wheel sizes but not the gear ratios. To time a motor one must be pretty well acquanited with the size of the cams so as to know what is possible and then the timing can be done intelligently. Ordinarily the exhaust valve should close at or slightly after dead center and open 25 to 30 degrees before the lower dead center. The inlet should open quickly after the exhaust closes and remain open to the end of the suction stroke or in some cases slightly longer. C. E. D.

TESTING CAUSE OF MUFFLER EXPLOSIONS

Please tell us the cause of explosions in the muffler, these occurring about every ninth or tenth revolution. Is it because the exhaust valve is not closed or because the spark misses and the next charge explodes the muffler?—G. S. WATERS.

Your engine probably misses fire in the cylinder for if it fired there it would exhaust burned gases which cannot be fired again. If the exhaust valves leak some mixture escapes each time, and so the muffler contents slowly become more nearly explosive until after 8 or 10 times it does explode. Test the spark with a spark gap and test the compression by turning over slowly and listenting for a leak, or use a candle at the exhaust valve with pipe removed.—C. E. D.

Hosted by Google

DOUBLE FRICTION DRIVE.

HALE, MO.

I enclose drawing and description of an improvement, made by myself, in friction transmissions for automobiles.

The drawing and enclosed data will enable you to see that it will do away with differential gearing and will not only permit but compel the outside driver to revolve faster in rounding a curve. Kindly give me your opinion of the device, if possible, in the next number of the Journal. ELMER BENNETT.

DESCRIPTION OF TRANSMISSION GEAR.

The steering wheels of the car being turned, as in the drawing, the rod A pushes the pivoted link B, as shown. drawing connecting rod C with it, thus, by means of the part D, giving sliding shaft E a partial revolution. This, thro the agency of the beveled washers, or flanges, F F (fixed to shaft E) causes the arm G to assume a diagonal position, thus, by means of the rods H H 1, pushing friction disc I farther away from the center of the driving disc J and pulling disc I1 toward the center of J1, thereby causing— through the medium of splined shafts K K1—the left-hand drive wheel of car to revolve faster than the right-hand driver in rounding a curve.

The speed-changing arm L moves the whole system endwise by means of its engagement with part D, which is fixed to sliding shaft E. It will be seen that, as arm C is always held at a right angle to E, it will, at any position of speed lever, assume a correct position on link B and the same will be true on the reverse.

Of course the starting crank of engine, would have to be bevel geared to some part, preferably the back face of one of the driving discs.

Some means could be provided for separating shafts K K1 so as to throw friction discs out of engagement with each other if necessary.

Your device for avoiding the differential is a good one and should be of value to some builder of motor buggies. It further combines the advantage of a double friction drive and so lessens the need for such severe service out of a single set of disks. The principle fault with friction drives is that they are worked beyond their limits and then eat power. (See another answer covering this subject.

The broad idea is not new, however. It was shown on a buggy at the last Chicago show or rather described as used thereon, and was patented by R. D. Scott on May 10th 1904, No. 759559. I do not know how broad this patent is and there may be others. I use it in one form on my buggy autos altho it is not a necessity.

In railroad work, no balance gear is used but the wheels are expected to slip in rounding a corner as they can readily do being metal to metal. There is some provision in the fact that the wheels are slightly larger close to the flange than away from it and that as a wheel is crowded close to a rail it runs farther per revolution and so gets ahead of the other and gets away from the rail farther. This provision is of more value in preventing friction on straight running than in turning corners so the railway requirements are much like the road requirements in the matter of turning corners. The road vehicle is at a disadvantage however in that its front end may skid sidewise easily and that its tires are likely to be damaged by slipping on the ground so it is necessary to use a balance gear if the drive is positive. With a friction drive, this is not true but the slipping can take place at the friction disks if two are used or at the ropes or similar slipping driving devices. And it will take place here if the friction at this point is less than at the point of wheel contact with the ground, the difference in leverages being taken into account of course. Your device will turn a corner nicely under ordinary road conditions even if you do not shift the disks. But to slip a wheel on the ground or a disk or driving device on its surface takes power and takes it just when power is needed, for the rig runs harder around a corner, and so some device that will serve as a balance gear without the cost, complication, weight and weakness of the usual gear will be found valuable and find use in future.

Your device adds some complication probably equal to what it saves but its advantages overcome this. It will maintain the same speed around the corner as straight away and this is a defect. We want a device that will slow up on a corner just as a horse slows up in turning. Such a device will save tires and wheels, prevent accidents and add much to the sweetness of auto using. This too is not a new idea and will find use as autos get more practical and less ostentatious.—C. E. D.

ABOUT SHORT AND LONG STROKE MOTORS.

ST. LOUIS, U. S. A.

Will you kindly favor me with an answer to the following question?

Assuming that the mean effective pressures are equal; that valve areas, lifts etc., are worked out in a similar manner, and that in both cases the piston speed in feet per minute is the same. What would be the relative power of a six cylinder, four-cycle engine of 4½-in. bore x 4-in. stroke, as compared with a similar engine of 4½-in bore x 5½-in. stroke? CHESTER E. CLEMENS.

Under the conditions assumed in your question as I understand it, there would be no difference in power at moderate speeds. At high speeds it might be that one engine would fill more completely than the other and thus develop more power but this would be rather a matter of length and size of pipe and carburetor than of difference in engines. If the engines are proportioned alike so far as valve openings and sizes are concerned they should draw in the same amount of new charge since they run at the same piston speed per minute and they should use this fuel with equal efficiency and so develop equal power.

There are chances for differences that would probably be found. The short stroke engine will be hotter than the long stroke one because it has less wall surface than the other and so it will probably be more economical of its heat and give more power on that account. But the other being normally a slower speed may not open its exhaust valve so soon and so get a little more expansion out of its charge. This last phrase must not be interpreted as meaning that a long stroke engine expands its charge more than a short stroke one, as many people think; for it does not do so if the valves open at the same time. The short stroke engine is more likely to have losses due to loose bearings and improper clearances than is the long stroke one. In short it is harder to make a perfect short stroke engine than a long stroke one. Per contra, two of the requirements of the Carnot cycle are little wall to the combustion space and quick expansion of the gases and both these are best in the short stroke engine. For auto use I prefer a short stroke engine "square" or even with stroke less than bore.—C. E. D.

(Attention is called to the fact that if the power is equal in these two engines both having the same piston speed, the long stroke engine is developing this power at less revolutions than the other.—Ed.)

2-Cycle Engines

HUGH DOLNAR.

WANTS 2-CYCLE MOTOR DESIGNS.

I wish to improve my engines, make them lighter and increase the power. I want to get in touch with one or two of the best experts, who I could get to get me out some good designs, without charging me fancy prices. I have from time to time tried experiments taken from your Journal, but it is too expensive to try everything that comes along. In a few numbers back I saw an article where Mr. Roberts designed the Elmore engine, but other parties had improved it so it is twice as good an engine now. Well, if that is the case, Mr. Roberts is not as great an expert as others seem to be. I see a French designer this two or three months back reduced the H. P. weight to 2.2 lbs.

I wrote Mr. — some 6 months ago about designing an engine, but his figures were so high I could not afford it; if I could get in touch with some one who stands at the top of the profession and would get me out some nice perfect designs, etc., as perfected to date, at reasonable figures, I would give them many different sizes from time to time to get out for me as I gradually climbed up in the business.

Now, could you suggest one or two of the best designers in this country, or in France, who does a little designing of two cycle and four cycle engines for] outside parties?

Another question I would like to ask—can you tel me what is the best carburetor made? I have asked hundreds; one says one and one another. The Schebler some say is the best, others say there is none today equal to the Longuemere, French make. I write you as I know you people are in touch with all kinds and are in a position to know what is what. I have either to get some spray valves, or some carburetors for some engines I am making, and I would like to get the best that can be had for good running, and would like your opinion and advice on them. I have used the James spray valves mostly on my engines the past years with fairly good results, but wish to get something better if there are any to be had. — NEMO.

Replying to this highly suggestive communication from an actual supplier of 2-cycle motors it should be said, first, that his condition is that of the whole class of present American 2-cycle motor manufacturers, so far as met by the writer. Some of the 2-cycle motor builders are good machinists, while others are poor constructors; all, without exception, have copied the work of others; with no attempt at understanding the operations of the 2-cycle motor and have been well contented to produce motors that run when called upon to do so, without knowing why or how they worked. At the most the American 2-cycle motor builders have only sought to obtain individuality by minor improvements and changes, almost all, so far as yet seen by the writer, supplying the cylinder charge by crank-box pressure.

Because of the superiority of foreign motor cars in 1902, all driven by 4-cycle motors, most American builders of small gas-engines, suitable for driving cars and small boats, neglected the 2-cycle motor and devoted all their powers to improving the multi-cylinder, 4-cycle motor, water-cooled, leaving the 2-cycle motor to builders of the lowest-priced engines, many of whom were contented to build anything, no matter how poor, that could be sold.

Every successful manufacturer must at least build work that will stay together and do what it is said to be able to do. So far, the simplicity and low cost of the 2-cycle gas engine, which is by far the lowest-cost heat engine known, has obtained purchasers for this class of motor, hardly more ignorant than the builders, neither maker nor buyer knowing anything about the engines except that they could be sold and would do work better and at less cost than small steam engines or domestic animals. With gasoline at four cents a gallon any kind of an engine gave cheap power. Now that gasoline costs four or five times as much fuel economy becomes important, and, as in the instance of this correspondent, makers of low-cost 2-cycle motors are beginning to see the need for improvement.

As to particulars, it must be borne in mind that gas engines of the small sizes here referred to have steadily increased in power from the first until now, and the doubling of the power of the Roberts-Elmore motor was an ordinary occurrence; as an example, the Buick motor was brought up from 14½ H. P. to over 30 H. P. maximum, with no changes that seemed of great importance except better machine work. It is not at all likely that any competent gas-engine designer will supply this correspondent with the best small gas engine, 2 or 4 stroke cycle, for less prices than quoted by Mr. —.

It m st also be remembered that any real improvement in small gas engines can be covered by a very valuable patent.

As to carburetors, all makers adve tise in the Journal, and any of them will send a sample and a salesman to any manufacturer who wa ts to try it out.

If this correspondent really desires to improve his motors he must first install a testing plant which will tell him what power his engines can deliver by burning a gallon of fuel, and he must next go to the cost of making changes and ascertaining the results following those variations. There certainly is no probability of obtaining the best small gas engine or even one a little better than common, without some ork and cost. It is also extremely probable that the less money an engineer asks for his work, the less profitable his work will prove to be.

The best small gas engine that can finally be produced is one of the most valuable of inventions and the only way any man can hope to own it without paying a large sum of money for it, is to invent it himself, and patent it in his own name.

The Journal will print working drawings of many 2-cycle motors during the coming year, and will print all information obtainable concerning 2-cycle motor performance. Several new cars driven by 2-cycle motors are now on the road, some of the motors being air-cooled, and 1908 bids fair to ee the superiority of the 2-cycle motor for car-driving indisputably established by actual work on the road.—H. D.

RULE FOR CALCULATING COMPRESSION.

CHICAGO, ILL.

We have a 4x4 2-stroke-cycle engine of automarine type: what we desire to know is, when our piston head is in the top stroke it is only $\frac{7}{8}$ from top of inside of cylinder. We use 3 rings $\frac{1}{16}$ wide 2 at top and one for base compression. do you think it is to close for compression space? What should be the correct space? The dimensions of our ports are, intake, $\frac{3}{8}$x4, exhaust, $\frac{7}{16}$ x 4½. We give the exhaust port $\frac{3}{16}$ of a lead over the intake, is there any harm in doing this? Our compression in base is very great. Which should have the most and how much? B. M. McCAIN.

Replying, would say that there is no functional relation between the crank-box pressure and the maximum pressure of the compressed charge. The high crank-box pressure is undesirable, but is inseparable from maximum cylinder charge volume with crank box cylinder charging, because the largest cylinder charge must be had with the least crank-box clearance and the least crank-box clearance must give the highest crank-box pressure. It would be better to charge the cylinder with no charge pressure, which can be done by means of a separate charging cylinder but is impossible with crank-box cylinder charging.

With four ins. piston travel, a $\frac{3}{4}$ exhaust port and $\frac{7}{8}$ compression space the motor, cold, will compress an atmospheric pressure volume of 4⅛ units into $\frac{7}{8}$ of one unit, that is, it will compress 33 volumes into 7 volumes, giving, with the cylinder above the top of the exhaust port full of air at 15 lbs. more or less, ordinary atmospheric pressure, 33x15: 7=70⅝ pounds compression, if the compression space horizontal plane area is everywhere equal to the piston area, that is to say, if the compression space is a prolongation of the cylinder bore. The compression space is commonly of greater diameter than the cylinder bore, and it is also common to round the top corners of the compression space; the greater diameter reduces the compression and the round corners increase the compression. Your motor probably has about 70 lbs. compression, cold air, piston tight, and moved slowly from the top of the exhaust port to the top of its compression stroke, so as to transfer to the cylinder walls and piston the heat squeezed out of the air, as compression proceeds. If the compression stroke is made very rapidly, then the heat generated by compressing the air will greatly increase the final compressed charge pressure; also any leak in the piston packing will decrease the compressed charge pressure. If your piston is ordinary snap-ring packed, then it is not tight, and if moved upward very slowly might show very little pressure. On the other hand, if the piston

Hosted by Google

is tight, and is moved rapidly, say so quickly as to make the compressing stroke at 2500 R. P. M. rate, in less than 0.012 seconds (12-thousandths of one second) the compression might be close to 150 lbs,, owing to the heating of the air, the heat having no time for transfer to the piston and cylinder walls.

Speaking in ordinary loose terms, your motor has 70 lbs. compression, full charge of pure air, and is ordinary practice.

Initial working pressure is, loosely speaking, about three times the compression pressure, if the charge is well and speedily fired, which would give approximately 210 lbs. initial pressure. The actual pressure can be ascertained only by a manograph in a manner too long to describe here.

As to intake and exhaust port dimensions measured engthwise of the cylinder practice varies, but it is common to make the exhaust open the full length of the intake port before the intake port is opened. You cannot open your exhaust port too rapidly, nor can you make your exhaust too free. I should say make your ports $\frac{3}{8}$ and $\frac{3}{4}$, with the piston head of such form as to have the exhaust open $\frac{3}{8}$ at the time the intake port begins to open, and have your exhaust open $\frac{3}{4}$ when the intake port has its full opening of $\frac{3}{8}$, length twice that of the intake. which would make your exhaust $\frac{3}{4}$ long instead of $\frac{9}{16}$.

Personally, I believe your ports should be about $\frac{7}{16}$ for the intake and $\frac{7}{8}$ for the exhaust, as there seems to be no gain by holding the burning charge very long in the cylinder. A 3-ins. stroke 2-cycle motor, observed by me, was very strong with $\frac{1}{4}$ inch compression space and an exhaust port 1 inch long, measured lengthwise of the cylinder.

The compression-finding rough rule, is to obtain the cylinder length from the top of the exhaust port to the cylinder head, and the compression space length from top of piston at high point to inside of cylinder head in fractions having a common denominator, multiply the larger numerator by 15 and divide by the smaller numerator.

Example, in your case with $\frac{3}{4}$ in. exhaust port and 4 ins. stroke $3\frac{1}{4} - \frac{7}{8} = 3\frac{3}{8}$. $33 \times 15 = 495$. $495 \div 7 = 70\frac{5}{7}$, the compression space being $\frac{5}{7}$ of an inch.

Your elementary questions are here answered at length because they are often asked, and it seems best to reply to them fully and finally, once for all. Actual compression and economy results are dependent on many variables, and cannot be accurately determined by calculations; the testing stand alone can tell the truth.—H. D.

COMPOUND PISTON OR CRANK CASE COMPRESSION.

BROOKLYN, N. Y.

Will you kindly give your opinion on the values of the following types of two-cycle motors.

1. A two-cycle, two or four ylinder motor with open crank-case and differential or compound pistons, the enlarged lower end of piston in one cylinder forming a pump-chamber which pre-compresses air only. This air is then by-passed to the inlet port of the other cylinder. In passing from the pump chamber to cylinder the air is carburetted by injecting the fuel forcibly into the by-pass. What would be the objection to using an inlet valve in cylinder head instead of regular ports?

2. A two-cycle motor in which a separate pump driven by crank shaft is used to pre-compress air only. Air is then by-passed to either a valve in the morking cylinder head or a regular inlet port. Carburetting occurs in by-pass as air is passing to working cylinder. It is assumed that all parts will be properly proportioned and of good design.

3. If, in either of these engines, three fuels, alcohol, kerosene and gasoline, can be used without material change, would the motor fill a commercial need and find a ready market, provided a motor of either type would show considerably more H. P. than others of the same size.—B. H. S.

Replying to B. H. S., (1) the "comp und," or better, the double integral-piston has been used as specified, with a carburetor, with good results, and has probalby been used with a pure air charge, fuel injected by pump or other means. With either method of fuel supply this scheme is practicable, and is much superior in every way to crank-box pressure cylinder supply, so far as functional considerations only are concerned. It is ture, however, that crank-box pressure supply can give equal power at lower cost of motor, with satisfactory flexibility and good fuel economy, altho not quite so good as with the two-diameter double-piston.

There is no prohibitive objection to extending the side-pipe to the cylinder head fitted with an automatic intake valve. The plan is old and open to public use, and is offered in the "Wolverine" 2-cycle, motors, Grand Rapids, Michigan, which have given, and, so far as known, are now giving satisfaction, but are not markedly superior to the common form of crank-box, 2-cycle motors which use the piston as both intake and exhaust valve.

2. The plan proposed is practicable, and has probably been successfully worked, though it has not been seen in operation by the writer.

3. Any fuel can be injected during the passage of a pure-air charge to the working cylinder. The Secor 4-cycle kerosene motor does permit a little cold kerosene to drizzle through a needle valve into a cold portion of the pure air intake pipe, and runs perfectly well with no vaporizing of the kerosene until after it is carried into the compression space and cylinder, by the suction of the piston during the intake stroke.

As to demand, the writer is convinced that the three cylinder, 2-cycle motor will displace all other forms of heat engines for motor car driving, and for small boats and flying machines. As to "finding a ready market" that depends on business management, as there is nothing broadly patentable in the suggestion of this correspondent. A car driven by a 3-cylinder motor all as suggested in (1) save that the charge is drawn through a carburetor, is now running in Cleveland, and if not described in this issue of the Journal, will soon be fully illustrated and described in this publication.—H. D.

A POWER DRIVEN LOGGING TRUCK

I have in mind the construction of a ten ton truck, to be used in hauling timber over ordinary dirt roads. This truck will have not less than a 60 H. P. motor, sliding gear, four speed and reverse transmission, jack shaft and side chain drive. The high speed will not exceed seven to eight miles per hour. Wheels will be steel, forty inch in diameter. Front wheels will have twelve inch steel tire, and rear wheels sixteen inch steel tire, crossbarred. The front wheels will have a raised center to keep them from sliping sideways. Frame will be "I" beam steel, two full eliptical springs in front only, no springs over rear wheels. The tread measure from center to center of each wheel will be somewhere near sixty inches. Brake bands will be very large, between the two rear wheels. Drive chains will be on sprokets on the outside of each rear wheel. Front part of the frame will be brought in so as to be only a trifle wider than fly-wheel of the motor. Back of the motor it will widen out to about ninety inches across. Loading platform will be about fourteen feet so as to take fourteen to eighteen foot cuts of timber. The rear wheels will be placed so as to take most of the weight. Body of course will extend over the rear wheels. Radiator will be suspended on springs so as not to be injured by vibration.

Now we only expect to use truck when roads are in good condition. We have read a number of your articles in the Cycle and Automobile Trade Journal, and would appreciate very much your opinion as to the practicability of using some trucks in the South for hauling timber, construction somewhat as outlined above. O. H. JEAN.

A logging truck, driven by steam, was built some few years since by A. O. Lombard, Waterville, Maine. The writer never saw this truck, but has been informed that it was extremely well adapted to work in the woods, and it would seem wise to become fully acquainted with the Lombard logging truck before undertaking costly original work in the same line.

If obtainable, some detail information as to the Lombard logging truck will soon be given in the Journal. Meantime Mr. Lombard would be likely to inform this correspondent fully, if addressed by etter. H. D.

CLAIMS FIRST EXTENDED PISTON MOTOR.

NEW HAVEN, CONN.

Noticing article in Journal, Oct. 1, relative to the Henderson motor, I wish to state that I made a motor, 1891 or 1892, having precisely the same pure-air ports as described by Henderson. This motor had a 3-port system. I have the old cylinders of that motor yet, and believe it to be the original extension-piston type.

The motor worked O.K. until it was well warmed up, when the extension became over-heated and caused premature explosions. For this reason, I abandoned this form of motor.—C. W. FOSTER.

It does not appear on the face of the design that this piston extension must, of necessity, cause premature ignition, though it undoubtedly did so as built by this correspondent.

An abandoned experiment, however, is no bar to a valid patent.—H. D.

BLOWER CHARGE INJECTION.

NEW YORK DEC. 23, 1907.

I have lately become interested in the two-cycle engine and have been reading with great interest the articles in the Mechanical and Technical Department of the Journal. I have gone carefully through the back numbers for the past two years, and note that you advocate the use of an auxiliary charging cylinder. I suppose this is to get away from the crank-box pressure which I should imagine would force out oil, and if the bearings were at all loose would cause an appreciable leakage of mixture, besides being an undesirable structure from a manufacturing point of view in the case of a two or three cylinder engine

As an alternative to the auxiliary cylinder would it not be practicable to use a rotary blower to force the charge into the cylinder, the blower being located between the carburetor and the engine? I suppose this method has probably been tried by some one, but as I have never seen anything in your columns in reference to it, I believe that a discussion would be of quite general interest.

As it appears to me the greatest argument which could be presented against this arrangement would be the possibility of a part of the fresh charge passing out with the exhaust, due to the constant pressure which would be maintained by the blower, but I think this could be overcome by throttling the charge, so that the loss, if any, would be only at maximum load, and full charge, a condition which you seldom get in automobile driving.

If this failed there are, of course, ways of "measuring" the charge, as is done in regular two-cycle practice without the addition of extra moving parts other than valves, and still retain the pressure blower for charging.

The only other objection which I can see to this scheme is the handling outside the engine of an explosive mixture under some pressure, but I understand that wire gauze will positively prevent back firing, and if so, it should be an easy matter to guard again this danger, and at the same time provide sufficient area of gauze to allow free passage of the charge.

My ideas at this time have not taken any more tangible form than a few sketches on paper, but I favor an engine having three vertical cylinders with exhaust ports extending all the way around, and with automatic intake valves in the heads. The bottom of the valve and the adjacent portion of the cylinder wall would be so formed as to prevent any of the old charge remaining under the valve. This works out in the form of a sort of inverted cup in the centre of the cylinder head with automatic intake valve located in the top of the same and the ignition mechanism close beside it. The entering charge would then sweep the burnt gases to the lower part of the cylinder and even with the throttle nearly closed the engine ought to run well as there would always be sufficiently good mixture in this cup shaped chamber to give an explosion. In connection with the engine, I would propose to use a blower giving, say, six or eight pounds pressure to introduce the charge into the cylinder, and control by means of limiting the travel of the intake valves.

I should like to have your comments on the arrangement outlined above, and if you know of any books which give any more information on the subject than has appeared in the Journal (which I doubt) would request that you kindly name them.—A. J. H.

Crank-box pressure gained by working-piston displacement does not give so much charge volume as to fill the vertical cylinder from the top of the exhaust port to the top of the compression chamber, as must be done to obtain maximum power.

Again, throttling reduces the charge volume and the compression, and so prevents the motor from making a working stroke with so little fuel as if the small fuel charge could be placed under maximum compression; herewith comes the stratified charge consideration. First, the most "flexible" motor, namely, the motor which will run with certainty through the largest power-variation range, is desirable, and the higher the compression the "leaner" the ignitable charge may be, hence constant compression is desirable, though it cannot be had with a throttled charge, because if a combustible charge is drawn into the crank-box and thence goes through a throttled passage to the cylinder, then the compression must be reduced, since the charge volume is not enough to fill the cylinder. Hence it is clear that reducing the combustible charge volume to reduce the fuel supply and motor power reduces compression and so causes ignition failure when there is enuf fuel in the cylinder to cause an explosion if the compression were normal maximum, all going to reduce the power range of the motor.

Suppose the cylinder to be charged with pure air only, and that this entering pure-air is, in some way, charged with a variable quantity of a combustible as it enters the cylinder, then the compression would be constant and a leaner charge would ignite than if, as with the throttled charge, the compression were reduced by the volume reduction to obtain fuel reduction.

So far, equal diffusion of fuel through the entire volume of the compressed charge is supposed. Now, as to the stratified charge.

A charge refuses to ignite when it is either too rich or too lean. This writing does not consider the too-rich charge at all, but deals with the too-lean charge only, which will not ignite because it does not contain particles of fuel close enough together to light each other, speaking in common language.

Now suppose a pure air compressed charge has fue injected close to the spark point, and that the spark is delivered when the fuel is injected; under these conditions it is evidently possible for a very small volume of rich charge to surround the spark and ignite under high compression and burn vigorously in contact with abundant air to ensure complete combustion, so that the fuel should deliver its full value in work on the motor piston.

This is the theory of the stratified charge, richer in fuel in some places than in others. The stratified charge was once considered important, but has now dropped out of sight, though recent experiments by Purdy, which I am not free to disclose, show conclusively that the stratified charge is of great value in the ordinary opposed cylinders form of car-motor, increasing both power range and fuel economy, in a highly desirable manner.

Now as to the fan supply, not of combustible mixture, but of pure air. This has been proposed many times, and was carried out by the late C. P. Malcolm, who drove a fan by directing the motor exhaust against the vanes of a fan motor which worked the pure-air fan and forced a charge of pure air through the cylinder, completely scavenging it. At the proper moment the fuel for one stroke was injected into the current of pure air entering the intake port and the charge was then compressed by the ascending piston. Mr. Malcolm died believing this system the best for small gas engines.

The "Euclid" car description appearing in the next issue of the Journal, details a successful application of the charging piston and cylinder to the 2-cycle motor. This plan has often been proposed but in the "Euclid" is carried out by an individual charging of the cylinders, in which one charging cylinder supplies only one working cylinder, in a manner not before seen by me.

Scavenging by overcharging with pure air is no valuable when it makes the cylinder colder than need be for proper lubrication. The quick opening of the large exhaust port instantly extinguishes the flame in the 2-cycle working cylinder and brings the cylinder pressure, I believe, below atmosphere. If this is true, then scavenging is needless, and all that can be done with the ordinary form of motor is to fill the cylinder down to the top line of the exhaust port with air or mixture at the lowest possible temperature, and compress the charge by the piston up-stroke, supplying the pure air charge with fuel at the proper time. In Harry Eason's 2-cycle motor the cylinder charge supplying and compressing proceed together at the same time, rendering it possible to charge the cylinder with any desired charge volume at atmospheric pressure, regardless of working cylinder dimensions.

The "Wolverine" 2-cycle engines, Grand Rapids, Mich., carry the side-pipe up from the crank-box to an automatic valve in the cylinder head, and are well liked. This intake valve placing is old and open to public use. My own preference is for the pure air charge not obtained by either fan or crank-box pressure, and injected fuel, doing away with the carburetor entirely.

There is no book printed, so far as I know, that contains anything of present value in relation to either the 2-cycle or 4-cycle small motor. The books were all obsolete before they reached the binder's hands, and the only, printed, useful, 2-cycle information is that given in the mechanical papers. The present issue of the Journal contains the most important 2-cycle motor information ever published anywhere, and will continue to publish all the real news of the 2-cycle motor obtainable.—H. D.

WANTS 2-CYCLE AIR COOLED MOTOR.

PORTLAND, OREGON.

In common with many others, I am interested in the 2-cycle type of gasoline motors and would very much appreciate the following information: Is the 2-cycle type as easily cooled as the 4-cycle? Have the manufacturers of the 2-cycle succeeded in producing a successfully air cooled, 2- or 3-cylinder motor of 10 to 15 H. P? If so, I would like the names and addresses of such manufacturers.—C. A. P.

Replying to C. A. P., the 2-cycle motor is very much more easily cooled than the 4-cycle motor.

I do not know that any maker is prepared to supply you with air-cooled 2-cycle motors.

The Euclid Motor Car Company, Cleveland has a successful 3-cylinder, 2-cycle, air cooled motor in a first car, 22 H. P.

The Page Auto Co., Adrian, Mich., has a successful 4-cylinder air cooled, 2-cycle motor in a first car, 25 or 30 H. P.

The E. W. Stevens Company, East New Market, Maryland, have, I believe, successful air-cooled, 2-cycle motors.

I have no doubt that the air-cooled, 2-cycle motor will displace all other motors for motor car work.—H. D

(A. H. Yocom & Co., Reading, Pa. can supply you with 2-cycle air cooled motors from 10 to 40 H. P.—Ed.)

RELATIVE POWER OF TWO AND FOUR CYCLE MOTORS

OLD FORGE, N. Y.

In the September issue of the Trade Journal, you published a H. P. table prepared by Mr. Worby Beaumont. Nothing was said about two or four cycle, so I suppose it was only for four cycle engines. If so, what would be the correct figure to multiply the result by to get the H. P. for a 2-cycle engine? In other words, what proportion do you consider the power of a 2-cycle engine to that of a 4?

I trust you will find room in your valued technical department to answer the above.—C. F. NORTON.

The 2-cycle motor is not so well standardized as the four and it does not give so dependable an output. On this account it is difficult to state a rule for comparison that is of any value. The charge cannot be compresst the full stroke of the piston for the exhaust port is not closed during the first one sixth of the stroke, so one sixth of the charge gets out. If this happens to be old gas there is nothing lost but if it is fresh gas the power is reduced thereby. It has been pretty generally accepted in the past, that the motors take 50% more fuel for the same power but the later motors undoubtedly do better. I think that adding 50% to the 4-cycle table will indicate as much power as you can expect, altho there are exceptional motors which will give more.—C. E. D.

Difficulties Successfully Overcome by Users

Under the above heading we will be pleased to publish how *you* solved *your* automobile difficulties. Many troubles have been successfully overcome by means of the answers in these columns. We earnestly urge those who have been thus benefited or any who have overcome such difficulties to send a brief account of the same to the Editorial Department of the Cycle and Automobile Trade Journal.

STEAM VERSUS GASOLINE A STRONG STEAM ADVOCATE

It is difficult for the lover of the up-to-date steam car to resist making answer to contributions such as the one indulged in on Page 86 of your December issue by "C. E. D." under the caption "GASOLINE versus STEAM,"and in my humble way, as an owner and user of a steam car built not far from Boston, wish to protest against the "facts" as quoted by "C. E. D." in answer to the question by "C. D. Flack."

1. I concede that the steamers use more water —this to their disadvantage.

2. It does not use more fuel if Kerosene oil is used (and to my mind after four seasons' use of Kerosene Oil, it is the only legitimate fuel for steam cars.) The up-to-date steamers do not have more parts. It does require more time to get ready, but once ready this is more than offset by the fact that it is ready at an instant's notice thereafter until again put out of use for the day, and does not have the uncertainty of the gasoline car with its variations in mixture which changes with every change in atmosphere, also other carburetor troubles and compression, ignition and over-oiling troubles. It does not have 100 symptoms for one trouble which keeps you guessing sometimes for hours as to what the trouble really is. As to air-cooled motors, which "C. E. D." endorses so highly, we think this reflects on his intelligence as an authority on motor cars in general. He says, "The intense flame is often destructive to the boiler." This is news to me. I have seen one boiler used constantly for four years and have then seen this car sold for within $200 of its original price, and is now running every day.

It does not require near the care to keep a steam car in order that it does the gasoline car capable of doing the same work, as it is not nearly so heavy and is not necessarily so expensive in construction. He admits after steam is up that they are more easily started; can be easily reversed; have a greater flexibility, have no clutches, speed change gears, etc; can pull hard from standstill, can be driven slowly without stalling, and he might add that a little $1,000 steam car can make a $3,000 gasoline car look cheap going up a hill, or on the level for that matter. He states that owing to some of the early steamers being "high financed" and their early development being too rapid, "it has had its best day."

"Oh! my friend, "C. E. D.," come off with your prejudice, and take another ride in an up-to-date steamer and you will learn something new.

My opinion is that the steamer is retaining its friends, and is rapidly getting more every year, and is far from its limitations as to development. Writing of limitations it seems that in order to keep up with the game it is now necessary to put in six cylinders, complete engines, into one car, adding to weight, also to price, and catering constantly to a narrowing market with each added engine, that it would seem that the gasoline car is rapidly approaching its limitation both mechanically and commercially. On the other hand one steam car manufacturer has three different powered cars with three different sized engines with great variations in power, has only one pair of cylinders in each car, and for speed, and hill climbing has no equal in the whole world, and when more power is wanted does not find it necessary to add another pair of complete engines.

Owing to lack of space it is impossible to go into many other arguments in favor of steam as against the internal combustion driven car, but to conclude let me say that both types have some very good points wherein they are superior to the other, and which cannot be supplied by the other; therefore, both have their field, but it seems that from both the mechanical as well as the commercial standpoint that the steamer is making greater strides, and that its limitations as to power with reasonable weight and expense, combined with all its acknowledged superior points, that it has not so nearly approached this stage as has the explosive car.

[The question of the relative advantages of steam and internal combustion motors is one that can be discussed almost ad infinitum without settlement but the preference of the public is clearly shown by the relative number of steam and gasoline cars built. For last year the proportion was about 6% steam to 87% gasoline. Ed.]

ANTI-FREEZING SOLUTION.

According to Mr. J. D. Maxwell, of the Maxwell, Briscoe Co., "there are three preparations which are mostly used in the radiator of an automobile to prevent freezing, namely: Calcium Chloride, Glycerine and Wood Alcohol. The calcium chloride solution has a tendency to attack the solder and destroy the metal. The glycerine is injurious to the rubber hose. The alcohol is absolutely harmless. A 10 per cent. solution of alcohol will withstand a temperature of 15 degrees above zero. A 25 per cent. solution will stand a temperature of zero, and a 40 per cent. solution will stand a temperature of 24 degrees below zero. Generally speaking, a 25 per cent. solution will be found sufficient. The alcohol evaporates more rapidly than water and any loss should be replaced by equal parts of alcohol and water."

Denatured alcohol, which is now made commercially, can be used for the same purpose. It is cheaper than wood alcohol, and can be obtained in most localities at about fifty or sixty cents a gallon.

WANTED EXPERIENCES WITH WATER REGULATOR

COLUMBUS, GA.

I would like to find out whether or not, F. W. Oldfelds Automatic Water Regulator could be safely depended upon to do the work that it is advertised to do if it were attached to a fire tube automobile boiler carrying, sometimes, as high as 700 lbs. of steam. I do not presume that you would feel at liberty to give a direct reply to this query yourself, but if you will kindly request any of the readers of the Cycle and Automobile Journal who have had experience with this device to give me the benefit of their experience therewith, I shall feel that you have done me a service for which I shall ever feel most grateful.—H. S. FLOYD

LOCATING A WEAK VALVE SPRING

Weak valve springs often are the cause of the sluggish action of a motor. A simple test to determine if this is the trouble can be made by simply inserting the end of a screw driver between the coils of the suspected spring while the motor is running and giving a twist to the screw driver. This spreads the coils and increases the resistance of the spring. If the motor running is improved and it speeds up slightly, it indicates that the valve has been acting sluggishly, usually due to a weak spring but sometimes due to a bent valve stem or one ruffed up owing to too great heat and poor lubrication, so before stretching or putting in a stronger spring carefully examine the valve stem.

HOW THE ENGINE ACTS AS A BRAKE

PHILADELPHIA, PA.

There has been much discussion about the use of the engine as a brake, some even claiming that to use it in this way is injurious. I have always made a practice of using the engine as a brake when descending long hills to save the regular brakes and when operating an air cooled car, to keep the engine cool and have never noticed any injurioous effects. However, if, when coasting down hill rapidly with engine stopped, the clutch is suddenly let in, injury might result particularly if the clutch was "fierce" or the car on the low gear.

The real cause of the braking effect seems to be a matter of discussion. My experience leads me to believe that the resistance is due largely to wire drawing and the passage of the gas thru the parts and passages as closely throttling the engine seems to increase the braking effect. Of course, the friction of the change gears and engine and the compression of the charge gives additional resistance, but, as the compressed charge upon expanding again gives back a large part of the energy expended upon it except for the heat dissipated, it would seem that the compression does not play as important a part in the braking effect as commonly supposed.—F. D. S.

CARE OF ALUMINUM PARTS.

DENVER, COLO.

As aluminum is so commonly used in automobiles, a word as to its care may be of interest to your readers.

The floor boards and running boards of my car are of aluminum, dull finish, they gradually became scratched and scuffed looking. I remedied this appearance as follows: By vigorously scrubbing the flat surfaces with sand soap and No. 60 or 80 emery, the scratches dissappeared and a dull or Roman finish was produced. The roughened or tread portions can also be improved in the same way, using a very stiff brush.—G. C. E.

TO REPAIR CRACKED CYLINDERS.

From time to time different methods of repairing cracked cylinders and water jackets have been published in these columns but until recently no special preparation has been offered for this purpose. Chipping into the crack carefully to form a dovetail groove, and pounding soft solder into the crack has been successfully done. Brazing the crack together with "Ferrofix" has also been successful but these successful methods can hardly be done on the road. A substance is now being marketed known as "Smooth-On" which is an elastic iron cement which can be applied soft and will harden to an almost iron-like substance, slightly expanding while hardening.

The method of repair is as follows: remove carefully any oil or grease from the crack and surface near it and heat the parts to about 600° F. with a torch or by running the engine. Then fill the crack with the Smooth-On, using a putty knife or jack-knife if on the road. If the cylinder is warm enuf the cement will melt somewhat and fill the crack completely, hardening very rapidly. A layer of cement should be spread over the crack and around the metal after the crack is full. Heating the metal makes the cement harden more quickly.

The engine will be almost immediately ready to run and the repair is permanent owing to the slight expansion of the cement upon hardening which makes it completely fill the crack and force itself even into the pores of the iron.

REPAIRING LEAKY RADIATOR.

Empty the radiator and with the cement about the consistency of putty by mixture with water, carefully fill the crack and let it harden, then cover it with a layer of the Smooth-On elastic cement and the radiator can immediately be used.

Gasoline is thinner than water and will pass thru a crevice so small that water will not leak thru it. Advantage can be taken of this in testing valves and leaks. If the valve will hold gasoline it will not leak gas.

When your car starts to skid, don't put on the brake but immediately shut off the engine. Brakes applied at this time only lock the rear wheels even if only moderately put on, owing to the very slippery road surface As soon as the wheels stop turning the tires are as free to slip in one direction as another and the skidding motion of the car will only be made the easier.

When cleaning a spark plug it is not nearly as essential to carefully clean the ends of the electrodes as it is to clean the insulating surface between the central electrode and the outside shell. The tips of the electrodes will take care of themselves unless the gap between them is actually bridged over by oil and carbon. The insulation is the important thing to be cleaned, for if it is coated, the current can easily travel across from electrode to shell or vice versa and thus short circuit the plug.

In drawing the water system of a car which must be left in a cold place during winter nights, the greatest care must be taken to be sure all the water has been removed. Occasionally air prevents all the water from drawing off and causes a bad freeze up. The lowest point in the system must be opened. In many this is the circulating pump and is fitted with a drain cock, if not the pipe should be disconnected. Shaking the car by standing on a running board will often start the pocketed water. Running the motor while the water is draining off also helps unless the pump is of such type as to prevent the water from returning thru it Care should be taken not to overheat the engine but simply have it hot enuf to help evaporate the water. Jacked carbureters sometimes have to be drained independently.

It has been found that with acetylene as a fuel the spark could be advanced much further without any preceptible piston pounding and also that the explosions were more violent and quicker. In regular traveling a mixture of 3 per cent acetylene and 79 per cent of air proved suitable, but the mixture percentage would probably have to be arranged to suit different cabrureters.

The Automobile Manufacturers and Dealers Association of St. Louis Mo., during the week of D cember 14, held a most successful show in the Jai Alai building, St. Louis, Mo., The exhibits numbered 31, eighteen exhibiting thirty-two different makes of cars, one exhibiting two makes of motorcycle and twelve concerns showing accessories.

At the annual meeting of the Board of Managers of the Association of Licensed Automobile Manufacturers on Jan. 6, the resignation of Charles A. Wardle, which had been in hand for some time, was accepted. Mr. Wardle is one of the best known men in the industry and has been actively identified with the Association since it was organized.

The Demoralizing Effect of the Shows

That the automobile makers and accessory manufacturers are deeply interested in the question of reducing the number and expense of the shows, is indicated by the large number of answers to our letter asking for opinions on the editorial "The Demoralizing Effect of the Shows," which appeared on page 73 of the January issue.

The following are a few of the many answers received by us and are indicative of the general feeling on this subject, some containing suggestions for the improvement of show conditions:

PHILADELPHIA, U. S. A 12-27-07.

Dear Sir:—Your valued favor of December 26th, together with enclosure of editorial dealing with the subject of shows, received. From my own point of view, and the opinions I have heard expressed by other manufacturers on the subject of shows, it seems to me that the points in this article are all well taken. While the burden of expense falls upon the manufacturer for the shows in the large cities, it is unquestionably a fact that the results obtained are comparatively small in consideration of the tremendous expense incurred.

Don't you think an automobile carnival week, with practically open air exhibits, in conjunction with a Vanderbilt Cup Race, stock car race and numerous other events, would serve to bring about greater interest in the automobile generally? One function of this sort, over a period of seven days, could be made such a suburbly interesting affair each year that a class of people who might not be reached in any other way would make it a point to attend, and with the people so inoculated with the motor car subject, I think it would contribute to greater interest from those able to purchase any type of automobile.

It seems to the writer that a stupendous national event of this sort would make it possible to concentrate publicity work and to give every manufacturer an opportunity to exhibit and demonstrate their claim for superiority to an audience which should, in a measure, constitute a national assemblage.

So many methods exist whereby it is possible to mislead the average owner or prospective buyer of a motor car into believing that certain makes are unqualifiedly superior to others, whereas the manufacturers who cannot afford to enter on an elaborate scale the various endurance contests, races, etc., would have an opportunity to so direct their appropriations for this purpose that it would be possible for them to compete with even chances and to honestly reckon with the big fellows in an affair conducted on the basis above mentioned.

Yours very truly,
CHADWICK ENGINEERING WORKS.
H. B. Carzrlere,
Sales Manager.

Gentlemen:—Replying to your favor of the 26th, in which you enclose an editorial which will appear in your January issue of your publication, will say that for several seasons past the National Motor Vehicle Co., has been very much opposed to indoor shows, such as have been held at Chicago and New York. We believe that the indoor show, such as we have been having, has outlived its usefulness, though there was a time when such shows served as a stimulant for the automobile business. These shows in the past served to popularize the automobile, but at the present time it is a hard matter to point to a town in the United States in which you will not find one or more automobiles, therefore we feel that the automobile has become sufficiently well-known to the American public to make shows of this nature altogether unnecessary.

The National Motor Vehicle Co., is one of the oldest makers of automobiles in this country, and consequently has attended all of the Chicago shows and all but one of the New York shows, and we feel that we are in a position to judge as to the merits of these National Shows.

There is one point, which you have not mentioned in your editorial, which has occured to us in our past experience, and that is the fact that in many cases, these National Shows prove a detriment to some of the small dealers in the small and medium sized towns. These small dealers, in most cases, have failed to realize the injury that these National Shows do them, but we think that upon investigation you will find that numerous prospective buyers in towns with a population of 80,000 or less, have been so influenced by National Shows as to become almost impossible customers for the retail dealers in their own towns; for example, a town of 25,000 will have three or four retail dealers, each carrying three or four representative lines of cars, making twelve or sixteen makes of cars handled in that town by dealers. If there were no National Shows, it is natural to suppose that the prospective buyer in that city would select one of the twelve or sixteen cars handled by his local dealers, but because of the National Show, and because that show is open to the public as well as dealers, many of these prospective purchasers will visit the National Show, look over all of the cars shown there, and will become what you might term "automobile wise," and he goes home without having purchased a car, and proves to be a very hard customer for anyone of the local dealers to handle, for the reason that he has seen points on one car and other points on other cars which appeal to him, and he has in mind some sort of a composite car, which the local dealer is unable to furnish for him. He has talked with the representatives of most every line made in this country, and he has gotten information which does him no good, but which places the retail dealer at a disadvantage in trying to do business with him. This prospective purchaser in many cases, will combine with several of his friends and arrange to buy three or four cars from some manufacturer if he can get a favorable proposition. He goes to the show and peddles his proposed order of three or four cars from one exhibitor to another, and in many cases gets quotations, which he would not get were it not for the National Show. We think for this reason in many cases the retailer has been materially effected by these National Shows.

We believe in an out door show to be held at some central point where cars can be demonstrated on a track, and where the dealers of the country can congregate and inspect the product of the various manufacturers, under canvass if necessary, and we believe that at a National Show of this kind, a race meet could be held to advantage, and we think the final outcome of the automobile shows will be an out door show of this description.

We have preached against shows for the last three years persistently, and we still believe that these National Indoor Shows have outlived their usefullness as a trade stimulator.

NATIONAL MOTOR VEHICLE CO.,
Geo. M. Dickson.

Gentlemen:—We have yours of December 26th, enclosing an editorial, which you stated would appear in the January issue of your publication, asking us to carefully read same over and write you a letter containing our opinion.

We have done this, although a little bit late getting at it, and however late, we can assure you that we heartily agree with the entire article, with the possible exception of the sixth paragraph, which states that "one or two representative exhibits with no admission fee," etc., etc., could doubtless be made profitable, and we think that these are unnecessary, and could not possibly agree with you that they could be made profitable from any point of view. We believe that on account of the multitude of pieces and parts of every kind that enter into a motor car, a live agent desires to see them before assembled and to see them in course of assembling, and therefore will look up the factory so as to get a good line up on the outlay before making contract, all of which he cannot do at any show.

FORD MOTOR COMPANY,
J. Couzens, Sec'y. & Treas.

Gentlemen:—In reply to your inquiry concerning our opinion as to the editorial which will appear in the January issue of the Trade Journal, would say that after carefully going over your argument, we would like to express to you our belief that the conclusion you reach is correct, and that the sooner elaborate automobile displays and exhibitions are done away with, the better it will be for the automobile industry, as a whole, viewed from the manufacturers' standpoint.

THE CORBIN MOTOR VEHICLE CORP'N.,
Guy Hutchinson,
Sales Manager.

Hosted by Google

Dear Sir:—I am under obligations for your courtesy of the advance copy of an editorial entitled "The Demoralizing Effect of the Shows," and I certainly want to congratulate you upon the courage which you show therein. There is little or no doubt that the national automobile shows have outlived their usefulness, and from now on, may be expected to follow the course that has been taken by similar annual exhibitions in other industries, is gradually approaching the time when they are of no interest whatever to anybody except those who have freak inventions or novelties of one kind or another to introduce.

The shows are now no longer even a place for the placing of an agency, and as a rule retail sales are otherwise accomplished.

In addition to the various demoralizing effects enumerated by you, we might add that the national annual shows tend to restrict the engineering development of automobiles to given calendar dates, instead of encouraging the making of improvements wherever required by circumstances and experiences. This is a bad thing, both from an engineering and commercial standpoint.

Neither do we believe that the exhibition of commercial vehicles will be of any advantage except to those with freaks to show, whether or not the question of the stimulation of the demand for commercial vehicles does not turn upon the question of invention, but mainly are a public comprehension of how to apply them to advantage, and to this end, shows contribute not at all. They rather tend to confuse the issue.

STUDEBAKER AUTOMOBILE CO.,
Hayden Eames,
General Manager.

Dear Sir:—Replying to your favor of the 26th ult., enclosing copy of editorial relative to the advantages and disadvantages of the automobile shows as a general proposition, which will appear in the January issue of your Journal, would say that I have read this with considerable interest and believe that the views expressed therein are the correct ones. It would seem, however, that so long as the New York and Chicago shows can draw a large attendance, not only from their immediate vicinities but from all over the country, they must be of considerable advantage to the automobile industry as a whole and that their elimination would be a detriment rather than otherwise.

OLDS MOTOR WORKS.,
W. E. Stokes,
General Sales Manager.

Gentlemen:—We acknowledge receipt of your favor of December 26th, enclosing your write-up regarding the demoralizing effect of the shows. In a great many respects you are right, but we cannot agree with you to entirely eliminate the shows. We do not feel that the automobile business has reached the stage where it is advisable or desirable to entirely discontinue the shows, and at the present time we are still in favor of shows and early shows at that. In the first place it keeps up the interest and enthusiasm of the public and the early shows compel the designers as well as the automobile manufacturers to get their models out early and in this respect it is a great help. Many features in your write-up are only too true. The expense part and all that are facts, but we still feel that it is a part that we have to bear under the present conditions.

STEVENS-DURYEA CO.,
C. C. Hildebrand,
Sales Manager.

Gentlemen:—We thank you for sending to us an advance print of the editorial of your next issue, which we have read carefully, and with full approval of its arguments. It is our opinion that if the trade press would keep hammering away in this and similar strains, it would bring about the desirable result of putting shows upon the only reasonable basis that is possible for so large and promising an industry.

MAXWELL-BRISCOE MOTOR CO.,
Ernest Coler,
Publicity Dept.

Gentlemen:—Your letter of the 26th ult, has been received, and we have read the copy of the editorial attached which is to appear in the January issue of your paper. In reply to your letter would say that we are in full sympathy with the statements outlined in the editorial referred to.

CADILLAC MOTOR CAR COMPANY.

Gentlemen:—

There is a good deal of sound sense in the editorial referred to in yours of the 26th.

THE WINTON MOTOR CARRIAGE CO.
per M.

Gentlemen:— We have your letter of Dec. 26th with editorial upon the demoralizing effect of the shows. We beg to say that we believe you state the facts none too strongly. We have always regarded the shows as a positive nuisance and have believed the cost in time and outlay, out of all proportion to the benefit derived and that they have generally been organized for the benefit of a lot of grafters, rather than of the manufacturers who have humbly paid the bills.

As we are doing a large business in more staple lines, we have been able to see the foolish waste in the automobile business. Dealers in engines, dynamos, marine searchlights etc., get along very well on a margin of5%, while the average automobile dealer declares that he cannot pay expenses on less than 30% and some of the so called jobbers demand 50% and more and cannot seem to make both ends meet.

It is true that heavy electrical machinery is sold mostly to people thoroughly familiar with such apparatus and that only a comparatively small amount is spent for advertising. The salesmen employed in this established line are mostly technical graduates who know the value of a dollar, and are trained for efficient work.

In the automobile trade, however, many of the leading lights are former bicycle and race track promotors who have had no training, whatever, in regulay mercantile business and seem utterly incapable of undertaking anything without making a "good time" for everybody.

We shall welcome the day, and we think it not far distant, when the get rich quick men will have sought other fields and the manufacture and sale of automobiles and accessories will be conducted along strictly business lines. Then goods will be bought and sold solely on their merits and a salesmen will be judged by his worth and ability, rather than by his capacity for liquid refreshment.

RUSHMORE DYNAMO WORKS.
S. W. Rushmore.

Gentlemen:— We have yours of the 26th., enclosing copy of an editorial, which you say will appear in your January issue. In our opinion there is a great deal of sense in your editorial, and in the main we agree with you. We are, however, in favor of one National Eastern Show and one National Western Show if it could be arranged so that both the licensed and unlicensed auto. manufacturers could unite in each of these shows the same as they did in Chicago this year. There is very little actual business in the shows for us, but we find them sufficiently beneficial in the way of meeting our customers and keeping generally posted to pay us for exhibiting at the two National shows if they could be held as we have suggested. The main difficulty seems to lie in the fact that New York city does not appear to have a building large enough for the purpose, and Chicago only manages to do so by using two or three buildings at the same time; otherwise, we think the licensed automobile manufacturers could put up with the society of the unlicensed manufacturers, and vice versa for at least a week in the east and another in the west. In our opinion the shows were held about two months earlier this year than they should have been.

BROWN-LIPE GEAR CO.
H. W. Chapin.
Manager.

Gentlemen:— We are in receipt of your esteemed favor of the 26th inst. enclosing article on the demoralizing effect of the shows and we fully agree with all that has been said in this article and think with you that the "Show" is getting to be a very expensive proposition from which very little results are obtained. Our opinion has been for the past year or two that as far as Accessory Mfgrs. are concerned a strictly business show held once a year, at some central point, where the manufacturers, jobbers and dealers could get together, see the patterns and models for the coming year and get posted as to what would be on the market is about the only show necessary and would accomplish more than the dress parades that shachgawsob deteriorated into.

We talked with quite a number of the Accessory Mfgrs. at the New York Shows and failed to find a person that was not thoroughly dissatisfied.

We think the time of the show was altogether too early and that with the financial trouble, which came on at that time, made the shows, as far as we could judge, nearly a complete failure, as concerns actual business. We should be more than pleased to see a radical change and if a show is to be held let it be held on business principals and for business only.

C. T. HAM MFG. CO.
Geo. W. Ham, Pres.

Hosted by Google

Gentlemen:— Replying to yours of the 26th, regarding the editorial in the Cycle & Automobile Trade Journal, will say that we have read same over carefully and believe that it coincides in nearly every particular with our opinions. We have already decided not to exhibit at more than two shows next year and possibly not more than one.

If we sift it down to one show, it will be the Chicago Show. We believe that there is no need to have more than one national show in this country, as anyone sufficiently interested in automobiles to make a trip could come to Chicago as well as to New York, excepting of course those living in the local district itself.

We note that France is trying to cut out one auto show and have the show only every other year. If they can stand it every other year, we certainly do not need to have more than one in one year.

We believe that a great deal of extra expense and inconvenience has been thrown upon the various manufacturers and especially the accessory manufacturers who are forced to show at both licensed and unlicensed shows. If this expense were cut out and the same amount of time devoted to increasing one's product, much better results could eventually be obtained.

We are heartily in sympathy with your project and trust that your paper, as well as others, will advocate at least not more than one show and this show should eliminate all attempts at making it a beautiful work of art or an expensively decorated reception room. people should come there with the intention of doing business and forget their social duties long enough to give the products exhibited a careful inspection.

THE SWINEHART CLINCHER TIRE & RUBBER CO.
B. C. Swinehart, Vice. Pres.

Gentlemen:— We are in receipt of yours of the 26th by your managing editor, enclosing printed copy of editorial which is to appear in your January issue with reference to Automobile Shows.

We fully endorse all you have to say in the article. There was a time in the early stages of automobile manufacturing when these shows were of great benefit, but of late they have certainly become a great hardship and a detriment.

We believe, however, that in large cities shows might be successfully held by local agents representing the manufacturers. Here would be exhibited regular stock cars such as the local agents propose to handle for the ensuing season. The cars for these exhibits should be purchased outright from the manufacturers, or in other words regular stock cars, and dates for these shows should be so timed as to make it possible for the manufacturers, without any unnecessary or demoralizing effort, to produce the cars in regular course of manufacture. Such shows would be patronized by people living in the selling territory, controlled by the agents, and prospective buyers would come in direct touch with the agents actually controlling the sale of cars in the territory. Such exhibits as above proposed could be successfully and profitably given without any great expense attending and with but a minimum admission fee charged, simply enough to keep out the undesirable and maintain an air of respectability. These are our ideas of what Automobile Shows must ultimately come to.

KINSEY MFG. CO.
Isaac Kinsey, Gen. Mgr.

Gentlemen:— In regard to your letter of December 26th enclosing circular in reference to early shows. My opinion is that there ought to be one big show centrally located in the United States, early in the Fall of the year for the benefit of dealers, and not for the public, where the next year's product may be shown, the same as the carriage manufacturers have, and allow no one in these shows except the trade. Then if the individual dealers wish to carry on shows in their own cities for a money making proposition, it is up to them and not the manufacturer of automobiles or their parts, therefore, the only expense to the manufacturer would be for the one show in a year.

This is my idea in reply to your letter of December 26th.

GABRIEL HORN MFG. CO.
C. H. Foster, Mgr.

Gentlemen:— We beg to acknowledge receipt of your favor of December 26th asking our opinion of your editorial "The Demoralizing Effect of the Shows." We are heartily in sympathy with your views on this subject and look forward to the time when all unnecessary display will be eliminated and when the shows, reduced in number to a minimum, will be conducted on a strictly business basis.

A. O. SMITH COMPANY.
A. O. Smith.

Dear Sir:— Answering your valued favor of the 26th beg to say that it is the writer's opinion that your article which you state will appear in the January issue of your paper, draws the matter very midly and is absolutely true, but not strong enough.

The automobile and accessory people have been fooling away money for the last two years going to shows. It cost us between $2,000 and $3,000 to attend the two New York shows in October and November, and the success of the shows did not warrant any such expenditure,—every manufacturer that attended these shows lost money by the venture.

The sooner the automobile and accessory people cut the show business out, the better off they will be, as you are right in regard to it taking away the best of a man's force to attend the shows and leaving the factory in a state of chaos. Everyone of the people who attend the shows should be at home attending to business and perfecting their cars or accessories, and we are about done with the show business ourselves.

We think that the same amount of money expended in advertising in your Journal or any of the papers would bring ten times the results. We know that we did not get but very few orders at the shows that we would not have gotten anyway, and could just have well done the business from the office or through our agents.

We suppose we will have to attend the Cleveland Show, it being local, and the writer being a member of the Cleveland Automobile Club, etc., but we are going to cut out the others, now, henceforth and forever.

THE SPRAGUE UMBRELLA CO.
Jas. H. Sprague, Pres.

Gentlemen:— We can only fully subscribe to every statement made in your editorial for January and nothing would please us more than to see these Automobile Shows dropped out. We mean by this, not only the various small shows, but also the two main shows in New York. From our point of view we can see absolutely no good that is served by these shows as promoters of business. We feel absolutely confident that the existence or non-existence of the shows would not affect our business one cent's worth. We do not so much mind the expense of attendance at the shows, although, of course, this is a factor, but we object to the demoralization that they necessarily bring about. This demoralization is not only that of our own business, but is evident also in the dealings with our various customers, whose influential men, in many cases at least, are practically not to be found during the unsettled show period. The only fancied advantage that the show has to bring about, of giving a change to meet people, is altogether elusory. It has been our experience that people have tried to meet us and we have tried to meet them and we have repeatedly made appointments during the show period, but have always been so taken up by others, that we have often found that we have had to make appointments later on, after the termination of the shows, in order to get together.

THE HESS-BRIGHT MFG. CO.
Henry Hess.

Gentlemen:— Your letter of the 26th at hand, enclosing copy of editorial which recently appeared in your Journal. We had read this editorial and it certainly contains material for serious thought, particularly in view of existing conditions, the result of several contributing causes.

There is no question but what the show business is being sadly over done. It is a severe tax any way you figure it, on the car builder, as well as the component part maker and while there is no denying the fact that these expositions have contributed largely to the public interest, as well as assisting in developing the demand for the automobile, at the same time, it would appear that the great increase in the number of these exhibitions has grown in all proportion beyond the growth of the industry itself.

The local dealers' shows should do much to further the interests of the automobile maker and one annual National Show should, at least, be sufficient for general purposes.

This, of course, does not take into consideration the development of the commercial car. This is an entirely different proposition and will have to be developed and have publicity invited along particular lines, applicable only to this industry. One thing is certain, the pleasure car builder, as well as the component part maker, are being asked to shoulder entirely too much expense to obtain results that are not at all in keeping with the disbursement.

TIMKEN ROLLER BEARING AXLE CO.,

Hosted by Google

Gentlemen:—We have your favor of the 26th inst. enclosing editorial which will appear in the January issue of your paper. We have read this editorial with considerable interest and disapprove of it only because it is not half strong enough. It would seem as though this show situation called for the strongest language permissible in descent print especially after the withering blast which struck the industry as a result of the early shows of some months ago.

As you know, the writer's opinion has been for years that a Trade Show will probably be a good thing for automobiles, the same as it is in other lines of manufacture, but one of these shows should be sufficient and it should be held without attendant enormous expense. It should be held out doors, the natural place of the automobile, instead of in a building, and it should be held where the machine can be seen in motion, where various friendly contests can take place. I am sure that without any trouble one or two large circus tents could be obtained for the occasion and the show could be held at the time of the year when such affairs ought to be held.

If local communities decide that a show is a good thing at the beginning of the season, let the local trade associations hold these shows as long as they find it pays. If the expenses of these local shows were put on the local trade they would soon find out whether or not such shows pay, and finding this out would in itself do a lot more toward clearing the atmosphere.

HYATT ROLLER BEARING CO.
P. S. Steenstrup,
Secretary and Sales Manager.

Gentlemen:— We have read your editorial article on the demoralizing effect of shows and most heartily coincide with your views, except, in some respects, you do not state it as strongly as we would.

The promoter of shows will keep them going as long as the Automobile Manufacturers and Accessory people will stand for it. They are simply being worked. One goes because his competitor goes, not because he wants to.

The Accessory Manufacturers particularly get the worst end of it in these Automobile Shows. He is tucked away up in some out of the way corner. The people he is most anxious to do business with (the Automobile Manufacturers), are busy placing agencies and do not care to be importuned at that time to place orders; he is there to sell and not to buy. The shows are not held at the time of year when jobbers and dealers want to place orders.

We took an independent stand this fall and did not exhibit at the shows in New York and Chicago and have been advised by a number of accessory people that it was a frost as far as any business they transacted.

As you have well said it is a waste of time and money. In its early stages it was all right. Local shows by dealers only in the spring may be a good thing for dealers who handle automobiles in the various cities.

ATWOOD MFG. CO.

Dear Sir:—Replying to your favor of the 26th, would say that after reading your editorial for the January issue we can say that we quite agree with you. We believe that two shows, at the most, would be amply sufficient for the manufacturers of the country: one in New York and one in Chicago held in the Fall of the year would, we believe, give as good results as the great number of shows that are now held, and would save the industry a great deal of expense. We believe that the admission to these shows should be free to dealers, but do not think there is any objection to making a charge to the general public.

If the dealers in small cities wish to hold local shows we do not know that there is any objections to this course, but think that it is a mistake for the manufacturers of accessories to think that they must go to the expense of exhibiting at every show in the country.

If your movements results in there being only one New York Show next year, we think you will deserve the thanks of every manufacturer in the country.

LEATHER TIRE GOODS CO.,
per C. B. Woodworth.

Gentlemen:— We are in receipt of circular letter of the 26th.

We beg to advise you that we would be greatly pleased if the entire trade gave up automobile shows.

They are an expense and a nuisance, and the sooner they are got rid of the better. GRAY & DAVIS.

Gentlemen:—Replying to your esteemed favor of the 26th, with copy of editorial which you state will appear in the January issue of your Journal, would say: that in our opinion your editorial states some very plain truths and outlines the situation very clearly as it exists at the present time. Of course, our business being largely in the way of an allied industry, we are perhaps not as largely or vitally interested as the automobile manufacturers. But it certainly has seemed to us for some time that the enormous expense which the manufacturer had entailed by the shows has become burdensome and that it is time that steps were taken to better the existing conditions and it seems to us that your action in this matter is well timed and will, we trust, lead to a better and healthier condition.

MERKEL MOTOR CO.,
per Edw. Buffum, Sales Manager.

Gentlemen:—We have your letter of Dec. 26th, and have read over the editorial which was to appear in the January issue of your publication, and I am firmly convinced that there are altogether too many shows at the present time. I am in favor of not over two shows being held during that portion of the season which will produce the greatest results. This is a matter on which there is considerable difference of opinion, but it does seem that through joint action of all interested, a proper date can be selected. The indiscriminate exhibiting of automobiles has served its purpose, and the automobile shows of the future should be handled strictly from a cold-blooded business point of view, with the idea of producing the greatest benefit to the greatest number of manufacturers.

SHELBY STEEL TUBE CO.
H. S. White, Ass't. Gen'l. Mgr. of Sales.

Gentlemen:—We are in receipt of yours of December 26th, enclosing an editorial which appeared in the January issue of the "Cycle and Automobile Trade Journal." We have read it carefully, and we certainly can commend it.

Without doubt, the Dixon Company has been able at the New York and Chicago shows to interest very many people in the practical working of automobile lubricants, which they would not have been able to have done without the facilities afforded by the auto mobile shows.

With the exception of the New York shows, the Boston and Chicago shows, the Dixon Company has not attempted any exhibit of its automobile lubricants at any of the various shows held throughout the country.

JOSEPH DIXON CRUCIBLE CO.,
Geo. E. Long, Treas.

Dear Sirs:—Answering your letter bearing date of Dec. 26th, regarding your proposed editorial on "The Demoralizing effect of the Shows," would say: the writer believes that the last analysis of this show business is advertising. The question of whether you shall set your advertisement up in attractive form so that it may appear artistic, is entirely a matter of personal judgment. We believe that answers a part of the contention of your article. Whether we shall have many shows or few, is answered by the question whether we shall advertise in many papers, or not; that is a matter purely of personal judgment.

If the "Public" does not patronize the shows, they will cease. If people do not advertise in the papers, they will not be published, you cannot write the show business out of existence. Public opinion is, "The Power behind the Throne." Just as long as they are patronized and interest the public, just so long shows will be held; when they cease to be profitable to the public and the promoter they will stop.

THE STANDARD WELDING CO.,
W. S. Gorton.

Gentlemen:— Your favor of the 26th instant at hand with article enclosed regarding the promiscuous holding of shows for the automobile and accessory trade, and would say we think you are on the right track.

Personally, we see no need of a show of this kind under present conditions, except, in three or four of the leading cities of the country. Certainly, no good can come from these shows, as the missionary work has been pretty thoroughly done, and it certainly is a drain financially, and a worry to the manufacturers, who feel as if they have to exhibit on account of their competitors doing the same. We think this matter should be thoroughly agitated, and we also believe that when the automobile trade looks this thing straight in the face they will see the nonsensical side of it, and will get together in abating what has come to be almost a nuisance.

Assuring you of our approval of the way in which you have taken the matter up, and with the compliments of the season, we are,

PITTSFIELD SPARK COIL CO.
Wm. S. Wood, Treas.

1. 1908 Stoddard Dayton Doctor's Car, known as Model 8 H. This small closed body car with but 88 inches se is good, it is claimed, for all kinds of weather. It is powered by a 4-cylinder vertical water-cooled motor 3⅞x3¾ ated at 18 H. P. and a three speed and one reverse selective sliding change speed gear mounted on adjustable roller The frame is a special one of prest steel of the company's own make. The car weighs complete 1650 lbs. and with ment of gas lamps, side lamps, oil lamps, generator, horn and complete set of tools, the price is $2,150.00.

ddard Dayton Doctor's Cab and Laudaulet

Dayton Motor Car Company, Dayton, has recently added to its 1908 line Model oupe, which is a light weight, medium based machine, with closed body giving tion in all kinds of inclement weather. motor is 4-cylinders, cast in pairs, valves on opposite sides, 3⅞ in. bore by 3¾-in. stroke, rated as 18 H. P. A selective sliding-gear change speed giving three forward and one reverse speed is employed, the shafts being mounted on Timken adjustable roller bearings. The rear axle is of floating type also on roller bearings. A special prest steel frame made by the Dayton Company is used and the springs are semi-elliptic both front and rear, all two

Digitized by Google

inches wide, the front being 36 inches and the rear 46 inches long.

The car is shaft driven and provided with emergency brakes on the rear wheels, and a foot brake on the change speed gear shaft. The wheels are 30 inches using 3½-inch Goodrich detachable tires. The wheel base is only 88 inches, making the car easy to handle in crowded streets. The clearance is 9 inches, and the car complete weighs but 1650 pounds. The body is of wood, any color being supplied. The price is $2,150.00 F. O. B. Dayton, Ohio, and includes an equipment of gas lamps, side lamps, tail lamps, generator, horn, and complete set of tools.

MODEL 8 N LANDAULET.

This neat machine has the same engine as the small Doctor's car and also the same general chassis specificactions. However, it is much longer being 101 inches in wheel base and the tires are 4 inches instead of 3½ inches. The car weighs 1400 lbs. and the price including the same equipment as on the small car, is $2,300.00.

It is a practical town car and the claim of the company is, that "it knows no closed season."

The New A. C. A. Dynamometer

Probably the most complete apparatus yet constructed for accurately determining the performance of any automobile is the new Dynamometer of the Automobile Culb of America, in its new building on 54th St. This unique machine will determine instantly and indicate, so it can be read directly from a large chart, speed in miles per hour and feet per second, draw-bar pull or tractive effort, brake horse power at the rear wheels, grade climbing ability and the power exerted by the brakes, of any type of automobile that may be placed upon it. It is claimed to be the most complete instrument of its kind in existance.

It will be used by manufacturers to determine the exact performance of cars, speed tests can be made without using the public highways without danger of accidents and also hill climbing ability can be instantly determined. Intending purchasers can unerringly compare the performance of one car with another.

The new device is not only a dynamometer or instrument for measuring the draw-bar pull of a car, engine or railway car but actually computes the results which are instantly and continuously shown by automatic pointers on a chart of large size.

THE MECHANISM.

Instead of traveling along as on a road the car is held stationary by cables upon the floor with its driving wheels resting upon two large drums which reach up through the floor and which the motor of the automobile causes to revolve. The revolution of the drums is resisted by a huge pendulum hanging below the floor, and attached to the drum shaft, not rigidly, but through a device furnishing a degree of friction which can be varied.

The pendulum, in consequence, swings out from the vertical a distance exactly proportional to the pull exerted by the car upon the drums. The amount of this pull, or "tractive effort" is indicated by a pointer moving across the scale and actuated by a special motor so it indicates accurately the movements of the pendulum. The more difficult measurement of the speed indicated by a vertical ruler moving across the large chart, upon which are horse power and speed curves, is based upon the running by a special motor, of a cone at as nearly uniform speed as possible, this speed being verified by a bell which rings at each 100 revolutions.

A wheel or roller, driven by the automobile and therefore revolving slowly or fast to correspond, rolls upon the surface of the cone and is pulled, by an independent motor, back and forth between the small and large ends of the cone until it finds, by means of a system of electrical contacts, the point where it does not slip because that portion of the cone presents the same speed as the roller. This longitudinal adjustment of the roller is transmitted by a wire cable to the speed ruler on the chart, and the power required for moving the ruler is thus made independent of the automobile. In other words, none of the power of the automobile is used in operating the indicators on the chart.

The speed of the car may be read from the chart directly, in either of the popular ways of stating it: Miles per hour, or minutes per mile, kilometers, etc., by means of several different scales provided, no calculation being required. All of the measuring apparatus is made reversible so that when running backward the performance of the car may be measured.

As a secondary apparatus, a grade meter is provided, operated by the pendulum indicator of the dynamometer. To use the grade meter the clamp is set upon the sliding scale at the point representing the weight of the car. The moving lever then assumes at each movement the angle of inclination of the grade the car would climb (if there were no wind resistance, slipping, etc.), with the effort that the car is then making.

To observe an automobile coasting down hill, either forward or backward, it is necessary merely to start the electric motor on the shaft carrying the two large drums upon which the driving wheels of the automobile rest. The brakes may then be tested and the wheels, gears or engine may be run free (not run by the power of the automobile) and the relative friction losses in these mechanisms determined.

e Earl Motor Car Company, Kenosha, nsin, U. S. A., began building cars from vn designs in 1904 and had its first car e road in 1905.

e notable features of this car included a ylinder opposed motor, $4\frac{3}{8}$x$4\frac{1}{2}$ ins. nom- 5 H. P. with a friction drive and chains e rear wheels. The chassis frame sides nds were of white oak wood, $3\frac{1}{2}$x$1\frac{3}{8}$ inch, reinforced full length inside with steel ches wide x $\frac{3}{16}$ inch thick, the reinforced being long enough to bend inward and corner braces for the chassis frame ends. riction drive was an aluminum disc, 18 in diameter, normally spring-pressed st a friction wheel 16 inches diameter, r fiber faced, $1\frac{5}{8}$ wide.

ides the coiled-spring thrust a pedal-

painting and new tires and the one new facing for the friction wheel.

A second Earl Roadster was begun when the first one had covered 16,000 miles. No change was made from the first model save to improve the body lines. This second car ran in the same wholly satisfactory manner as the first. The Earl Company guarantees the fiber friction ring to do 10,000 miles before requiring renewal.

The roadster, it is claimed, makes 21 or 22 miles to the gallon of gasoline and, as its repairs are very small, it is one of the cheapest cars known for running expenses.

The company began a first lot of six cars January 1906, which were all sold before completion at $950.00 each, and delivered as soon as finished.

. 1. Earl 1908 4-cylinder Roadster. Wheel-base 107 ins., tires all 32x$3\frac{1}{2}$ ins. Motor four-cylinders, 4x4 ins. 4-cycle oled, 22 H. P. Friction drive, aluminum alloy disk and leather fiber faced friction wheel to divided counter shaft ur balance-gear, and chains to rear wheel sprockets.
adster body with seats for two, three or four passengers. Weight 1640 lbs. Price, $1,200.00, including mats, horn, d 3 oil lamps.

ed linkage was fitted by means of which re of the driver's foot on the pressure could greatly augment the friction en- ent load. The friction wheel sleeve was l across the chassis frame in plain bear- nd supported divided axles with an en- spur-balance-gear. This first Earl car ed about 1460 lbs., tanks full, had 100 wheel-base and was on tires 30x3 inches. ght weight made the car fast for its power, better than 40 miles on a good straight-

The Earl Company had worked in very unpretentious quarters in Milwaukee, but a move was made to a commodious factory in Kenosha, July, 1907, where a lot of 20 cars was began, the last of which is leaving the factory the day of this writing, December 23, 1907.

The company placed a second opposed cylinders model on the road about November 15, 1907. The cylinder dimensions were increased to $5\frac{1}{8}$ x $4\frac{1}{2}$ inches, nominal 20 H. P., increasing the weight to about 1520 lbs., wheel-

fully tested on the road, but the indications are that it will be close to a 60 mile car.

$950.00 for the two seat roadster opposed cylinder 20 H. P. motors.

Fig. 2. Earl 2-cylinder Roadster, with bodies to seat either two, three or four passengers, wheel-base 100 ins., ins. Tires all 30x3 ins. Motor a pair of cylinders, opposed, 5¼x4½ ins., 4-cycle, water-cooled, 20 H. P. Friction drive to divided sproket shaft with spur balance gear and chains to rear wheels. Weight about 1520 lbs. Price, to seat 2-passengers $950, 3 passengers $965.00 and $1,000.00 for the 4-seat road cluding mat, horn, tools and 3 oil lamps.

To date, the company has delivered 31 cars, and is now finishing about one car per day, and has no unsold cars on hand and it is claimed, is filling orders which will bring the sales-total to 81 cars delivered January 15, 1908.

In addition to these two passen models, the company is now complet first commercial car, opposed cylinde H. P., pneumatic tires, 30 x 4 inches, road 1000 lbs only, 15 miles per hour

Fig. 3. Earl 4-cylinder chassis, side elevation. This car is remarkable for simple construction, light weight cost. The front axle is a straight tube, 2 ins. dia., the rear axle is a straight steel bar, 1¾ ins. square. The springs are all half-elliptics. The chassis frame is wood, 3½ ins. wide, reenforced and braced inside with st 3-16 in. thick. The drive is friction with chains to rear wheels. The steering gear is rack and pinion. 22 H. P., 107 in wheel-base, tires all 32x3½ ins.

The first opposed cylinder motor will not be

Earl light weight factors include a

BRAKES.

These are exterior bands only, on 10 ins diameter rear-hub drums. The bands are camel's hair belting lined and are 3-hole lever and pedal applied. No evener is fitted. The friction can be used as a brake.

SPRINGS.

The Earl springs are all full elliptics, 34 ins.

. 4. Plan of Earl 4-cylinder chassis, showing the general arrangement of the engine, friction disc and levers and rol levers. This car is notable for simplicity of detail, light weight, and excellence of wooden chassis frame construction.

n chassis frame, the sills reinforced by plate, $3\frac{1}{2}$ inches wide x $\frac{3}{16}$ thick. This ced-wood, chassis-frame side has stood ll from the first, is low cost, and has not hanged at all.

long x $1\frac{1}{2}$ ins. wide, 5 leaves in front and 4 leaves in the rear. The rear springs are revolubly connected to the chassis frame bracket on top and the cars are claimed to be very easy riding.

5. Earl 4-cylinder roadster, friction drive and control described fully in the text. This illustration also shows

Digitized by Google

shafts on either side of the steering post, with ratchet retained rocker levers under the steering wheel.

The friction drive shift is by a single outside hand-lever, with a rod to the short arm of a bell crank at the rear end of the chassis; the long arm of this bell-crank reaches forward to the grooved hub of the friction wheel with fork screw ends entering holes in a U-shaped bronze casting with its parallel members fitted to slide in the friction-wheel hub-groove.

ment of levers in such a way that push pedal forward aids the coiled-spring in p the disc to the rear against the leathe faced friction-wheel. The coiled spring sufficient engaging pressure to the dis wheel for driving the car with ordinary conditions. For very bad roads and hill-climbing the left pedal is used to in the disc and wheel friction. The li applied to the friction action are of the simple description, a long-armed bell

Fig. 6. Earl 4-cylinder Runabout chassis, left side of 4-cylinder motor. Cylinders are 4x4 ins., 4-cycle, water good standard construction every where, 22 H. P. The exhaust is carried over the intake, avoiding transfer of heat to coming charge.

There are three pedals on the driver's footboard The right pedal is pushed forward to apply the rear hub drum brake bands through a rock-shaft, no evener, with a long off-set in the brake links from the rocker arms to the 3-hole, brake-band closing-levers, the links have a screw adjustment for length to obtain equal brake action. The middle pedal is pushed forward to disengage the friction disc and friction wheel. The friction disc shaft slides in a plain bearing, and is normally coiled-spring forced to the rear until stopped by the friction wheel. The disengaging action is a pedal linked to a rocker which has a forked

for the friction wheel traverse, and a rocker carried in dropped hangers belo disc-shaft for disengaging the friction an by use of the left pedal, for increasin friction of the disc and wheel.

It was the intention to make a 100 measured fuel run on this new Earl car, is very light, is said to be easy riding a have a high per gallon mileage, but, mu the regret of all concerned, unforseen ci stances made this extended demonst impossible and the writer did not ride i Earl cars at all.

esign, style and comfort.

SUSPENSION.

relieving the passengers from the effects of vibration and shocks usually experineced in traveling over rough roads. The body frame is mounted on the two full elliptic rear springs and is pivoted in the middle of the front end to the front end of the sub-frame. The sub-frame which carries the engine and transmission is mounted on the two front full elliptic springs and its rear end is carried in a large hollow trunion or ring-bearing which is supported in a hanger attached to a cross member of the body frame. Thus the body frame and sub-frame are each carried on three points of support. Fig. 2, shows clearly how the power plant is carried on the sub-frame.

The shaft drive from the rear of the transmission to the rear axle is had through two universal couplings, but since the sub-fram slopes rearwardly on a line with the cente of the axle, the driving shaft in normal position is straight, thus minimizing the movement o the universal couplings. A spring cushione torsion rod connects with the rear axle an body frame. Adjustable ball joint radiu rods extend from hangers attached to th body frame to the front axle.

THE MOTOR.

This new motor is of Nordyke & Marmo Co. design and construction, the best feature of notable foreign and American practice bein in a general way, closely followed and Mr. H C. Marmon, its designer, sees no reason fo

Digitized by Google

water piping and gear driven centrifugal pump, all of liberal dimensions.

The valves have a clear opening of two and one-quarter inches diameter, taper seats and the intake valves on the right side are interchangeable with the exhaust valves on the left side. A hinged lever with a hardened steel roller in its outer end riding on each cam, lifts the valve tappets, thus preventing the side thrust on the tappets and consequent wear in the guides that follows when the valve tappets, either with or without cam rollers, are lifted by direct contact with the cams. These roller levers are hinged in bronze holders set in ports in the sides of the crank case, held to place in pairs by crow-feet. The guides for the valve tappets are of Parsons' white brass, also held to place in pairs by crow-feet. The crank shaft is a single steel forging two inches in diameter with flanged end to which the flywheel is bolted. The shaft is hollow and is mounted in Parsons' white brass bearings of liberal dimensions to insure long life without readjustment. The drop forged connecting

against the aluminum and through bol castellated nuts and lock washers, inste studs set in the aluminum case, are u other parts of the motor.

OILING SYSTEM.

The Marmon system of automatic lu tion is used. The oiling is accomplish means of a gear-driven gear pump which oil through a screen and forces it to the main bearings where it enters the hollow shaft through radial holes and is forced th the shaft into the connecting rod bearing through tubes up the connecting rods in piston pin bearings. The oil passage ex entirely through the crank shaft from the to the rear bearing, so there is absolute

Fig. 2. Right Side Marmon Model H Motor. This new water cooled motor is of Marmon design and manuf t follows closely approved American and foreign practice. The cylinders are cast in pairs with valves on opposite sides ore is 5 inches and stroke 5 inches; 40–45 H. P. It is carried on the special sub-frame, mounted on the full elliptic llowing Marmon practice. wheels run on large conical roller bearings on the axle tubes and are driven by the floating axles within, clutched to the outer end of the wheel hubs. The differential is of the bevel gear type, mounted on large conical roller bearings, and it is removable through a cover in the axle housing. The floating axles may be slipped out from the outer end of the axle tubes. The drive shaft carrying the bevel gear pinion is supported in bearings, both forward and back of the pinion. A torsion rod extends from the axle forward to a double spring cushion supported from the cross member of the body frame. This axle is of latest approved design, having large bearings, and is well proportioned.

Fig. 4. Front of Marmon Model H Water Cooled Motor, showing the swiveled supporting cross arm of the motors, sub-frame, and the complete housing of the gears.

The front axle is of steel, I section proportioned for great strength and stiffness. The ads supporting the springs underneath are made integral with the axle. Large conical roller bearings are used on the wheel spindles and the weight is carried by ball bearings in the upper end of the spindle yokes. Heavy annealed steel forgings are used for the yokes and steering arms.

Each rear wheel has two brakes, one external contracting and one internal expanding, both having adjustments for wear. The brake shoes are lined with camels hair fabric and the levers are connected by rods to the outer ends of two equalizers across the body frame. The equalizers are operated by two long walking beam levers connected with short rods to the right

column is mounted on roller bearing, one at bottom of the aluminum case and the other at the top, thus supporting the screw and mechanism of the gear centrally between The bearings are adjustable. This spe well designed steering gear was fully desc in our May issue 1907, p. 107. The co carries a steel screw working in a large b nut, hard babbit lined.

The form of construction employed el ates lost motion between the parts and neglect in providing oil or very long cont use should bring it about, in which even babbitted nut can be readily replaced w new one at small expense.

Wood artillery wheels are used. The are cast steel and have turned brass hub The diameter is 34 inches, with quick de able rims for 4-inch tires in front and 4½ rear. The wheel base is 114 inches.

The springs are full elliptic front and and to minimize the effect of spring reco four springs are equipt with shock abso these being a part of the standard equip

THE BODY.

The body of the Model H touring c made entirely of the Nordyke &Marmon perfected aluminum castings mounted o substantial hardwood frame. This cons tion makes a body which is practicall destructible and not affected by any cli conditions. It is claimed it takes and a beautiful finish, is not easily marred and not shrink, swell or dent. The rear sea commodates three large persons comfor and the tonneau has sufficient room for extra seats, provision for which is made. front seat is divided. Compartments u the rear seat accommodate the battery, p jack, tools, luggage, etc. The floor in is of cast aluminum removable panels, a trap door in the tonneau gives access to parts under the body. A foot rail, robe and Wilton velvet carpet in the tonneau provided.

The upholstering is done with the bes genuine leather, white curled hair, coil spr etc. The cushions are made over spring fra with spring edges and coil springs are use the backs of the seats. The binding and are of leather and the workmanship and terial throughout, it is claimed, is of the hig order.

A complete set of tools is supplied, all ne and conveniently arranged, in a tool placed on the step. The gasoline tank is

THE $2000

THE STANDARD OF AMERICAN AUTOMOBILE VALUE

Mitchell

Perhaps you've noticed that most cars cost more than the Mitchell.

Did you ever notice that they were any better in finish or in material—or any better in **performance**—on the road?

Ride in a $2000 Mitchell and **see.**

Have any Mitchell agent "show you" a Mitchell.

Look it over—go out into the country and test it on the toughest hill you know of—through some particularly bad stretch of sandy or muddy road. Notice your power—notice speed—notice the sweet running motor—the tranquil action of all moving parts—ease of control—notice general efficiency, Mr. Prospective Owner.

Then if you can see how you'll get two or three thousand dollars more automobile value out of any other car—**buy** the other car, we won't say a word.

But you won't **find** more value in any other car.

Present day automobile value is **standardized in** the **Mitchell** at **$2000.**

A demonstration will prove this to **you.**

You are under no **obligation** to buy when you ask for a demonstration.

If you are considering the purchase of a car we want you to **know** the Mitchell, and we want **to show** you what you get in a Mitchell at $2000 and that you can't get any **more** in **any other** car, **regardless** of the price.

Call up the Mitchell agent.

vhich are carried on a small shaft supported at the end of an arm clamped to a oss on the front cylinder. This arrangeient allows the fan to be removed without disturbing any of the other parts, and lso gives a fan belt adjustment, the belt eing flat and one inch in width, runing on aluminum pulleys. The fan lades and the hub are a one-piece alumium casting.

WATER CIRCULATION AND OILING.

The water enters the cylinder jackets t a point on each side of the exhaust for ach pair of cylinders, thus equalizing the ylinder temperatures. The Schebler caruretor is used. The crank case is supported by an integral projection forming pan, and no front cross member is

1 inch by ¼ inch, and of about 75 pou tension. The clutch spring thrust justment is accomplished by means three member ball thrust, which is mo by means of a threaded bolt, whic retained in any position by a split being expanded by a wedge pulled int somewhat similar to the well known cycle handle bar fastening.

The thrust is controlled by a l thrust ball bearing, which is fully enc and lubricated by a compression gr cup carried in the end of one of the trunions by means of which the colla moved. This bearing rests agains flange which is a part of the claw coupl and transmits the power from the cl hub cam. At the rear of the fla

Fig. 3. Left side of 50 H. P. American motor, showing the high tension magneto, centrifugal pump and oil tank. ket of each pair of cylinders is fitted with a drain at the lowest point as shown which facilitates the removal of all the ja ter when draining the system. This engine and also the change speed gear are supported from the main frame by a ral crank-case pan construction no sub-frame is used. The fan is carried in ball bearings on an arm which is swively mou a boss on the forward cylinder, thus providing a means of belt tension adjustment.

ed in the frame, its omission being posble owing to the webbed pan of the enne case acting as a frame cross memr. This construction shortens the hood ngth by the depth of one cross frame ember. Oiling is by a force feed oiler rried under the floor boards at the rear the dash. This device is driven by a

against which the clutch control bear works is bolted and split a square gu and on the forward end of the transm sion shaft is fitted on a large taper a s ilar box. Between these two is a link w squared ends, the faces of which rounded in a similar way to that viously described in connection with

Digitized by Google

selective operation. The secondary shaft, the sliding gear member yokes and the shifting rods in the case are all in a horizontal position, the gear case is also divided in a horizontal plane. This transmission is mounted on large annular ball bearings thruout, and the ends of the gear shifting rods protrude into a cap, and are not exposed when operated. The drive is direct on the fourth speed. The reverse gear at the bottom of the case is never in motion, except when the car is in the reverse. The main shaft is milled with four integral splines. A very large plate covers the case, making the mechanism accessible.

THE REAR AXLE AND BRAKES.

The rear axle construction is of the bevel gear differential floating type, the entire weight of the car being carried on the live shaft housing tubes, the shaft driving the wheels by means of squared inner ends and square outer ends, which engage claw clutches which drive the wheel hubs. The axle is provided with a turn buckle truss rod, and the central housing is well ribbed, the upper half being removable for accessibility, thus making a much stronger construction than when the housing is divided on the center plane. This entire construction is mounted on adjustable ball bearings.

Fig. 4. The special cross-head-like slide used for the rear end connection of the front springs instead of the usual links. The guide is riveted to the under side of the side frame member or sill. In this slides the dovetailed piece which carries the spring bolts. The slide is lubricated by a small compression grease cup on the side with ducts, as shown, leading to the bearing surfaces. This device eliminates the excessive backlash usual with link connections and allows the frame to be placed a little lower with springs of equal camber.

On each of the rear wheels a double set of brakes is used. Both of these brakes are of the expanding type, and are placed side by side on the inside of the steel drum held to the rear wheels by bolts thru alternate spokes. The two brakes are exactly alike, and are working under similar conditions at all times. The brake bands are pivoted at diametrically opposite points, one at the front and one at the rear on studs, each stud not only acting as a support for one of the brakes, but a portion of it being formed into an expanding cam for opening the other brake. Two foot levers are used, the right operating one of the rear wheel brakes, while the left thru a 9 to 1 reduction controls the clutch. The usual hand lever controls the other rear wheel brake, and the gears are moved by a lever with thumb button release operating in an H slot. Spark and throttle levers are on a stationary notched sector on top of the hand wheel, the spark lever controlling both the timer and the magneto thru bevel gears at the foot of the column thru suitable linkage provided with special ball and socket jointed ends. The pull on the rear wheel brakes is thru an equalizer of single tree type, which operates concentric shafts on a cross supporting shaft between the side frame members.

THE UNDER STEERING FRAME RUNABOUT.

The particlar feature in connection with the runabout is the method of supporting the frame on the under side of the axles instead of above the axle, giving a low center of gravity as described briefly in the December, 1906, issue, age 160.

This frame construction, as shown in the accompanying photographs, consists of placing the forward springs on top of the forward axle in the usual manner, their rear ends being carried in a fixture riveted to the upper side of the side frame members, while their forward ends are link connected to the ends of the side frame members. The rear springs of the semi-eliptic type are revolably mounted on the rear axle, their forward ends being connected to brackets on the upper side of the frame, while the rear ends are link connected to a cross bar which passes complete across from sill to sill. With this construction, if a spring breaks at the forward end as the bolt comes out, the frame simply drops about an inch, and no material damage is done; in fact, the company claim for demonstrating, the cars are often driven with the forward end of one of the front semi-eliptic springs unsupported. Even if the front end of both springs should give way, the front axle position is maintained by the rear ends of the springs which drive the axle thru their rear rigid connection to the frame. With this dropt frame a slightly raised prest sub-steel frame for supporting the engine and transmission is used, the engine base having integral crank case supporting arms instead of the pan construction used on the other models. In other respects the engine is identical. In spite of the fact of this drop frame construction, the car has a universal clearance thru its entire length of 10¼ inches, the under side being covered by a shield, which is perfectly flat.

of Hagerstown, Md., offer for 1908 a large and varied line of cars. The Pope Tribune, which is a 4-cylinder, 20 H. P. runabout, with full lamp equipment, horn and generator, is listed at $1750, and the Pope Tribune, 5-passenger touring car, with full lamp equipment, horn and generator, at the same price, $1750. The Pope-Hartford, Model M, 4-cylinder, 5-passenger touring car, 30 H. P., full lamp equipment, horn and generator, lists at $2750. The same car equipt with Eisemann magneto and coil, is listed at $2950, and with Komet magneto and coil at $2850, or with high tension magneto only, $2800. In addition to this there is a Pope-Hartford, Model

tions, or approximately 1300 R. P. M the engine at a point directly between exhaust ports, and drops to the botto the jacket, and rising on the opposite passes out at a point also in the hea the cylinder. The cylinders are cas compact pairs. The valves are oper by vertical adjustable length push and rocker arms, the pivots of which each provided with oilers. The w jackets are cast integral with the c ders, and the valve chamber for each is in the casting between the cylinder, into this chamber the inlet gases are livered. The inlet pipe is a short piece aluminum casting, connecting

The New 1908 Model M Pope Hartford. This car has the distinguishing lines of the Pope Hartford's and is driven cylinder, vertical, water-cooled motor, with all gears encased; cylinders cast in pairs with integral heads and water ja echanically operated valves located in heads, all interchangeable, operated by one set of cams and push rods. A eel crank shaft with extremely liberal bearings is used. The clutch is of the leather faced cone type with 34 inserted e change speed is of the selective sliding type with gear shifting rods entirely encased and the case supported on three p aft drive, wheel-base 112 inches, wheels 34x3½ inch front and 4 inch rear tires. Price with an equipment of two large s ne search lights, generator, two side oil lamps, one rear light, horn and full set of tools and floor mats $2750.00. Exte p $150.00 extra.

, runabout, with the same equipment as e touring car. In addition a Model R, ope-Hartford, which is similar in design the 1907 Model L, with a few improvements and slight modifications, and is also quipt with a high tension magneto, is sted at $2500. The Models R and 10 Tribune have not been changed except as to inor details, but the Model M touring r and the Model M runabout are new is year.

MODEL M.

This new car is of the 4-cylinder vertical water-cooled type of the same bore d stroke as last year, the bore being 48 and the stroke 5⅛ inches.

The distinctive Pope-Hartford features, ch as the arrangement for timing of the

pairs of cylinders with the main int pipe which is copper running downw and backward to the carburetor.

CARBURETOR.

A new type of carburetor has been signed by the company and used on model. This carburetor is of the f feed type, having an annular float wh is concentric with the aspirating noz thus the height of the gasoline in the zle is not affected by the position of car body when on hills, side grades, The main air intake is thru a copper p the air being taken from around the haust pipe, this warm air passing up t the central opening of the carbure around the aspirating tube. A slid

Loring Auto Appliance Co.
3d Street, Cor. Broadway, New York City

The ignition is by jump spark with a 4-unit vibrating coil on the dash, current being supplied by storage batteries carried under the tonneau seat. The timer is of their own design of the La Costa roller type, and is mounted on a short shaft at the side of the crank case between the second and third cylinders, and driven by spiral gears from the cam shaft. Provision is made for the installment of a magneto, a bracket being formed integral with the crank case to carry the same. The magneto can be connected by short shaft with an Oldham coupling, to a gear in the forward casing, which meshes with the cam shaft gear. The plugs are located in the side of the cylinder heads. The bosses thru which these plugs pass are entirely surrounded by the water of the jacket. These plugs are, therefore, not subjected to any great amount of heat, as is often the case with plugs placed in the heads, and can very easily be removed, as the threads do not stick.

CONTROL AND BRAKES.

The spark and throttle levers are on a stationary sector on the hand wheel. These connect thru the steering column by means of the usual concentric tube and rod to short levers at the bottom of the column. All the connections from this point to both the timer and throttle, wherever the levers have to move out of a single plane, are provided with ball and socket joints similar to those used in the steering linkage. This method of connection eliminates all lost motion.

There are two pedals, and as in previous models the left pedal is connected thru an equalizing lever to the rear wheel brakes, and also disengages the clutch before applying the brake, while the right pedal can be ratchet retained in any position or not, as desired, by slightly tipping the foot. This pedal disengages the clutch and also operates the transmission brake, which is an external contracting band, the band being of sheet steel faced with camel's hair belting, acting on a prest steel drum, the drum being 12½ inches in diameter and 2¼ inch face.

The rear wheel brakes are of the internal expanding type, 14 inches in diameter by 2¼-inch face, acting in cast-iron drums attached to the flange of the rear hub, so that the braking effort, as well as the driving torque, are transmitted thru the same member of the hub. This feature is particularly important, as in many floating type of axles the drive to the wheels is thru lug clutches at the outside ends of the hub, while the brake drums are attached to the loose flange of the hub instead of the one which is integral with the driving end.

COOLING SYSTEM.

The water circulation is maintained by a gear pump mounted on an integral bracket of the engine case near the front at the left. This pump is positively driven by a shaft with an Oldham coupling connected with a gear in the forward housing meshing with the 2 to 1 gear, the pump being driven at engine speed. A continuation of the pump shaft also provided with an Oldham coupling drives the force feed lubricator, which is provided with 5 feeds, 4 of which lead to the cylinders, and the fifth maintains the oil supply for splash in the crank case. Four of these feeds are fitted with sight glasses on top of the oiler, while the fifth lead passes thru a sight feed on the dash, so that the driver can be sure that the oiler is in operation. A gage is also arranged in a convenient corner of the oiler, so that the amount of oil can be seen. A four-bladed fan is mounted on a column supported on top of the half time gear housing, and is belt driven from a pulley on the pump driving shaft. The radiator, which is, as in previous models, a distinctive Pope feature, is of the "Planetic" type, and is manufactured in the Hartford factory. The same outline, which has not been changed for three years, is still used.

The crank case is of aluminum, the supporting arms being integral with the upper portion of the case, which also supports the crank shaft bearings. The lower portion is as usual simply an oil pan. Special efforts have been made to have this pan oil-tight, so that the claim is made that no oil drips either when standing or running.

The crank case arms are supported on a prest steel sub-frame, the members being of channel section supported by cross frame members at each end. A metal pan extends under the engine and fly wheel to the transmission case. This pan is provided with a door on the underside, which gives access to the four drain cocks at the bottom of the engine case, and another opening which gives access to the carburetor, both for adjusting the aspirator valve and permitting the removal of the entire float chamber without disturbing the piping.

CLUTCH.

The clutch is of the inverted cone leather faced with 34 one-inch diameter corks inserted. The coupling between the clutch and the transmission is the same as used in 1907. The change speed gear is selective, 3-speed and one reverse, all gears being made of chrome nickel steel specially treated, the ends of the teeth being bevelled in a new way to ensure easier meshing. The gear shifting mechanism consists of two bars having forked ends, operated by a single ball-ended lever, mounted on a shaft having its bearings entirely in a bracket, cast integral with the cover of the transmission case. The rear changing hand lever is mounted on the outer end of this shaft, operating thru an H gate. The slots in

Hosted by Google

this gate are clearly marked to show the speed they represent. The gear case is supported at 3 points by integral arms of the case. The bearing contains the shifting shaft, and is integral with the cover of the case, and has no other connection with the frame, so that there is no possibility of cramping of the shifting mechanism due to weaving of the frame on uneven roads. The drive is by cardan shaft provided with two universal joints of their own design. These joints consist of a central block which is hollow and filled with grease, the bearings for the pins being phosphor-bronze bushed, and felt washers are provided so that the grease cannot work out nor dirt work in.

REAR AXLE CONSTRUCTION.

The rear axle construction is of the floating or clutch type. The driving pinion is mounted on Timken roller bearings, the bearing nearest the pinion being very much increased in dimensions over previous years. The differential is of the spur type, and is assembled with the driving gear as a unit, and runs in phosphor-bronze bearings, the shafts being steel hardened and ground. There is a suitable means provided back of the bevel gear for not only taking the thrust of this gear, but making it possible to ensure a perfect meshing of the teeth, the thrust being taken by a ball thrust bearing. The housing is divided in a horizontal plane some distance above the centre line of the axle, the removal of the cover from this case making it possible to remove the entire differential and driving gear unit, also the bevel driving pinion without removing the axle from the car.

The rear wheels run on Timken roller bearings which are mounted on the outside of the rear axle tubes. These tubes and the case are of sufficient strength to carry the car without the necessity of truss rods, the company believing that the truss rod is a bad feature owing to the possibility of an inexperienced operator tightening up the turn buckle on the truss rod until all the bearings in the axle are cramped, whereas, with their construction free running bearings are always insured. The wheels are driven by nickel steel shafts thru claw clutches made of special steel hardened and fitting into corresponding notches in the end of the wheel hub. Particular emphasis is laid upon the construction of this hub, inasmuch as the driving and the braking are both thru the same member, the brake drums being attached to the flange which is integral with the hub barrel.

SPRINGS.

The springs are semi-elliptic, the front springs being 2x38 and the rear springs 2x52. These springs are attached to the axle by large sized clips of special material so as to do away with any possibility of play between the springs and the axle, this being a common cause of spring breakage. All the springs are shackled at their rear ends.

ARMORED WOOD FRAME.

The frame is the same armored wood type that has been used by this company for several years. The frame ends are much longer than used before bringing the axle directly under the center of the radiator. The guards are of special design and are provided with patent leather aprons extending from the front of the front guard thru to the rear guard, filling in the entire space between the running board and the frame.

The wheel base is 112 inches and the gage 56 inches. The front wheels are equipt with 34x3½ inch tires, and have ten 1¾ inch spokes. The rear wheels have 34x4 inch tires and twelve 1¾ inch spokes, the wheels all being mounted on Timken bearings.

STEERING GEAR AND CLEARANCE.

The steering gear is of the worm and sector type operated by a 17-inch wheel of new design. The steering connection is all of the ball and socket type, the cross connection being placed back of the axle in a position where it is well protected. While the car is equipt with larger wheels, the engine and transmission centres are very low, thus keeping the center of gravity down, yet the road clearance is large, being about 11 inches.

The car is furnished with the regular touring car body of the convex type, seating five people, all of the seats being wider and deeper than on previous models. The tonneau is also considerably longer. The dash is of the distinctive Pope-Hartford design, same as used last year.

MODEL M RUNABOUT.

The mechanism and frame construction of this car is the same as the Model M touring car, except that the wheel base is 108 inches. This car will be equipt with bodies of three distinct styles, a four-passenger runabout, having a double rumble seat; three-passenger runabout, with a single rumble seat, and a single seated runabout having a trunk on the rear deck. The hood is considerably longer than the regular model, the engine and transmission being moved back so as to get the weight on the rear axle. This permits of a much greater rake on the steering post, giving it quite a racy appearance.

NORTH AMERICAN

PHILADELPHIA

Each city has its daily newspape which is popular with automobilists, but is seldom that any one particular news paper in a city the size of Philadelphi reaches a point where it becomes pract cally the official motoring organ of it locality. Such is the unique position occu pied by **THE NORTH AMERICAN,** and s thoroughly does it dominate this particu lar field that many local manufacturer and dealers use it exclusively for adver tising automobiles and automobile acces sories.

In substantiation of these claims w refer you to the facts and figures on th opposite page.

Hosted by Google

THE

NORTH AMERICAN

PHILADELPHIA

During the recent Automobile Show held in hiladelphia, seven leading dailies issued special show ımbers. **THE NORTH AMERICAN** carried in its ›ecial show issue 23,146 lines of advertising, which ıme within a few hundred lines of being twice much as its nearest competitor, and almost equalled e total lineage appearing in the other five papers ›mbined. These figures are absolute proof that **HE NORTH AMERICAN** is the recognized automo- le advertising medium of Philadelphia.

Wise advertisers realize that circulation ›th in quality and quantity is the element that ıakes a newspaper the medium through which it is ›ssible to reach high-class buyers. There are a mil- ›n and a half people in Philadelphia and a million ıd a half more nearby. Of these three millions the ass who can afford to own motor cars read **THE ORTH AMERICAN.**

1908 Crawford Cars

The Crawford Automobile Co., Hagerstown. Md., builder of the Crawford Cars, offer for 1908 in addition its to well known line, two entirely new high powered shaft driven models of such lines and general design as to please the most fastidious 1908 car purchaser. These high powered 1908 models both have the same general chassis arrangements, with of course, the exception, that the weight distribution has been altered in the runabout. The motor in each, is of the 4 cylinder, vertical water cooled type, the cylinders being cast separately and having a bore of 5 inches and a stroke of 5 inches. These motors are rated at 40–45 H. P. The total weight of the touring car is but 2800 pounds making the car exceptionally speedy and a good hill climber.

Fig. 1. 1908 Crawford Runabout. The chassis of this model and that of the touring car are essentially the same, except for weight distribution. Motor, 4-cylinder. vertical, water-cooled, cast separately, 5"x5", 40–45 H. P., shaft drive, 4 speed selective sliding gear direct on the third speed with accelerated tail shaft on the fourth, wheel base, 116", tread standard, weight, complete of touring car, 2800 lbs., price, including full equipment of five lamps, generator, horn, tools and tire repair kit, $3000.00.

These 1908 machines are shaft driven and provided with a change speed gear of the sliding type, there being 4 speeds ahead and one reverse with the direct drive on the third speed, the fourth being carried up, or in other words, the tail shaft is accelerated or runs at a higher rate of speed than the engine. By this arrangement is it possible to obtain a very high speed without racing the engine and at the same time the ratio of gearing is such that the car can easily negotiate heavy roads and hills on the direct drive, that would be impossible for a car of the same speed, weight and power but geared direct on the fourth speed. In other words with a gear as low as 3½ to 1 exceptional speed can be had without racing the engine.

SPECIAL FEATURES.

The special features of the previous Crawford design, such as the finishing of the lower portion of the cylinders below the water jackets by machining, and the use of two pairs of inelastic piston rings near the top fitted over a broad ring in the common groove in which all three rings are placed, are also incorporated in the new models. With this arrangement there is practically no chance for the gas to leak, regardless of the method of cutting the ring opening and in addition the outer rings against the cylinder walls are in their normal condition. Another set of these rings is placed at the bottom of the cylinder for oil distributing and circumferential oil grooves are also cut into the piston above the lower set of rings thus providing not only oil retention pockets but uniform distribution of the oil around the piston. Another special feature is the large bearing surface provided for the crank shaft, there being five bearings with an aggregate length of 15½ inches. These bearings are of babbitt as are also those of the connecting rod. The latter is of the usual drop forged pattern, the cap being held by two bolts. The valves are of large size placed on opposite sides and are removable through caps which are bolted to the tops of the valve chambers. These caps make a tight joint with the cylinder by means of copper asbestos gaskets. The exhaust is carried off by means of a generously proportioned malleable cast iron manifold and a muffler of proper design. The Schebler carburetor is used as exhaustive tests, it is claimed that this instrument is especially satisfactory in its workings on the Crawford Motor. The intake manifold, as in the previous models, is a single cast alluminum unit, as shown in the left side view of the motor. The two to one gears are entirely encased at the forward end, the gear on the engine shaft being of steel meshing with fibre gears on the cam chafts. The cam shaft is ingeniously arranged so that by simply loosening two nuts it can be removed and the bearings inspected or replaced. This is accomplished in the following manner: The cams are keyed on with Woodruff keys and

Hosted by Google

sition even though the key should loosen. bearings are held in place by a bronze d alluminum housing in which the silent end valve lifting rods operate. These ngs are held in position by means of yokes orked ends which hold the two adjacent ngs, each yoke being held on a stud by le nut, and by simply releasing this nut oke can be swung out of position im tely allowing the housings to be lifted ncovering the cams and the bearings. alve springs are of the conical type so here is no chance for them to close solidly er. Comparatively low compression is giving smoother running at low speeds nger motor life and ability to pull evenly almost closed throttle.

IGNITION.

ouble system of ignition is supplied on cars and consists of a Bosch high tension eto, which is mounted as shown in the panying photograph, and gear driven the half time gears, and a storage battery vibrating Connecticut coil, and distri-

the exhaust valve, which is fully jacketed and passing out at a point at the top of the opposite side, both the intake and the pipe to the radiator are suitably tapered to cause an equal distribution of water to and from the cylinders. Efficient means are provided for taking up the slack in the fan belt. A special feature consists in the weight disposition in the fly wheel which is comparitively light but has an extremely broad and thin rim with all the available weight at the periphery.

THE CLUTCH.

As in previous models a clutch of the multiple disc metal to metal type housed in the forward end of the change gear case is used. For 1908 the discs are saw-stock against mild steel instead of against bronze as the mild steel has been shown by tests to wear better and has no tendency to score or rough up. The plates are 36 in number each having its rim cut to form peripheral disengaging springs so that although the clutch runs in oil in the forward part of the change gear case, there is no chance for the plates to "oil drag" or adhere but instantly separate upon being released. A

. 2. 1908 Crawford Motor, 5x5″ 40–45 H. P., double ignition, Bosch magneto and accumulators distributor and single alves on opposite sides and lower portion of cylinders turned smooth, giving finish and accurate wall thickness. Note hod of mounting the cam shaft in raised projections of the crank case. The valve lifting rod guides form the upper he bearing housings and by loosening two nuts one at the center of each of the holding yokes shown the adjacent hous- y be removed and the cam shaft lifted out. All gears are encased and the distributor is accessibly located.

Digitized by Google

direct on the third speed. The lay shaft is below the line shaft and the controlling lever operates selectively.

Referring to figure 4 it will be seen that there are three square section shifting rods which work in milled grooves in the case and are entirey enclosed. The gear shift lever is mounted rigidly on a tube which telescopes a transversely located brake shaft, is free to slide on it, and carries at its inner end the piece A, the end B of which engages the corresponding hollow in the upper side of which ever rod is to be moved. The speeds not in use are locked by a transversely sliding bolt in a groove across the under side of the three shifting rods. The sector like end C of piece A works in the slotted end D of this bolt moving it in unison with the gear shift lever, so that a groove in this bolt is brought under which ever rod is engaged by B, allowing that rod to move freely while the ungrooved body of the bolt locks the other rods. Special care has been exercised to make it impossible for dust or grit to work in between the sliding tube and the brake shaft upon which

gency pull brake levers.

it moves. This has been accomplished by using a felt ring in a groove between the outer end of the tube and the shaft upon which it slides. This gear shift sleeve or tube is mounted on ball bearings as shown in Fig.5 so that it cannot bind and always moves freely. A single large hand hole at the top makes accessible the interior of the alluminum case. The gear shifting rods are entirely encased so that there is no chance for oil leaks and when the top of the case is removed these rods can be taken out easily as each is an integral piece.

AXLES AND FRAMES.

The rear axle is of the floating type driving the wheels by means of dog clutches, the weight of the car being supported on the ex-

driving the wheels by outside clutches and are entirely relieved of any car weight.

The frame is of the usual channel section, cold rolled prest steel construction, well braced and riveted and a steel protecting pan extends under the entire mechanism of the cars.

an element of sporting blood and is on th out for a racing machine equally as exp

* * *—these will not be particularly ested in this story of the "Success Buggy," which, frankly, is not a mach such ambitious pretensions." But th

Fig. 2. 1908 Model 35 Rumble Seated Pungs Finch Runabout. Motor 40 H. P. 4¾x5 inches, water-cooled. chassis construction similar to the larger model, wheel-base 106 inches, tires 32x4 inches, weight 2500 lbs., price $2500.0 Detroit.

Two sets of brakes are supplied on the rear wheels. The foot operated, being externally contracting on the drum and the emergency brakes being internal expanding bands on the same drums and operated by a side hand lever.

The wheels are 34 inches fitted with 4-inch Diamond tires, both front and rear; the car complete weighs 3,000 lbs. It is claimed by the makers to be capable of a variation on the direct drive of from 3 to 50 miles an hour. The gasoline capacity is 19 gallons. The car is equipt with three oil lamps, two gas lamps, generator, horn, storage battery, magneto, top and complete set of tools and sells thus equipt F. O. B. Detroit, Mich., for $3,500.00.

MODEL 35.

This car is usually fitted with a runabout body and rumble seat. The motor is of the same general type as in the larger car but is 4¾ x 5 inches and rated as 40 H. P. The chassis is otherwise the same as Model 50, but the wheel-base is only 106 and the car weighs but 2,500 lbs. The tires are large for the weight, being 4-inch both front and rear, but the wheels are 32 instead of 34 inches. The equipment is the same as the other car and the price is $2,500.00.

1908 "Success Auto-Buggy"

practical light weight high wheel mod $250 and $400 respectively, will certain peal to a larger class of buyers."

TRUFFAULT-HARTFORD SHOCK ABSORBER

THE DEVICE THAT MADE

afe, Speedy and Comfortable Automobiling Possible

The spring action of a car affects its smooth running qualities. Proper control of the springs pre-ts excessive oscillation, which insures LESS WEAR and TEAR, LONGER LIFE OF TIRES, REATER SPEED and GENUINE COMFORT.

This control of the springs can be secured only by the use of TRUFFAULT-HARTFORD ock Absorber—the device that has made SAFE, ECONOMICAL AND COMFORTABLE omobiling possible.

In the 1908 model we believe that we have practically obtained perfection.

A distinctly new feature has been added, consisting of a regulating dial with indicator, making it sible for even a novice to obtain a perfect and uniform adjustment to suit the exact requirements of car as measured in terms of its gross weight, and easily secure the maximum benefit.

The Truffault-Hartford is the only spring retarding device manufactured with a regulating dial. It utomatically lubricated, absolutely dust and water proof, interchangeable, practically indestructible and y guaranteed.

The superiority and individual qualities of the Truffault-Hartford Shock Absorber are best demon-ted by the fact that it has been adopted exclusively as equipment by such prominent cars as the:

PIERCE GREAT ARROW, STUDEBAKER, STEVENS-DURYEA BIG SIX, STODDARD-DAYTON SIX-CYLINDER, MARMON, CONTINENTAL, LANE, CONOVER, SULTAN, FRONTENAC, AND ACME SIX-CYLINDER.

bined with low first cost are the strong talking points of its makers, the claim being made that actual tests have shown that one of their cars can be operated for less than a single horse and buggy.

CONSTRUCTION.

The 4 H. P. motor consists of a single vertical air-cooled cylinder of 3¼x3 inches supported on the right side outside the piano box type of body by a strap or yoke beneath the crankcase and held to the ends of two transverse angle irons securely bolted across the bottom of the body. This frame work also supports a cross shaft at the left end of which is a sprocket which drives the left rear wheel, at once doing away with the differential and yet sufficient it is claimed, for all needs of such a light rig. The engine drives by chain to a short cross shaft carrying a compact two speed and one reverse planetary a chain from which drives the before mentioned cross shaft. Special nickel steel chains are used and the reduction from motor to transmission is 6 to 1. The chain to the large rear wheel sprocket is of the roller type 1⅜-inch pitch. There are two hand brakes on the transmission sufficiently powerful for all ordinary use.

Fig. 2. Model C Success Auto-Buggy. This car has a two cylinder opposed air cooled by fly-wheel fan, motor set lengthwise under the body. Drive is to a countershaft with differential and planetary gear and drives to each rear wheel sprocket by side chains. 12 H. P. water cooled 4½x4 inch two cylinder opposed motors will be furnished at $50 extra. Car weighs 700 lbs. and sells for $400. Extra long body and two seats $100 extra. Rubber tires, ball bearing wheels and top extra.

The axles are 1-inch dust-proof and the reaches are ironed full length. Wrought Bailey loops are used. The front and rear oil tempered springs are each set crosswise,

either a float feed carburetor or mixing will be supplied. The gasoline tank ho gallons, sufficient for a day's run as, it is ed, these cars will do from 50 to 100 mi gallon, according to road conditions an speed up to 25 miles per hour on the lev in the low gear climb anything in sight.

HAYNES

Model S, 30 H. P., $2500

A SAFE CAR TO BUY

We can claim for the Haynes engine absolute reliability, we can show cord of unfailing strength for the frame, we can promise to every purchaser omplete satisfaction and freedom from annoyance but other makers claim and romise such things too. Here, however, are a few facts about the Haynes hat are simple enough to be admitted at sight.

1. The Haynes design has not been extensively altered in three years, nd one model—the 30 H. P. Car—has undergone no variation whatever. A ar that has developed no weak points in that time is a safe purchase.

2. The Haynes won the great Chicago Motor Club Endurance Run, beg awarded the only perfect score in a test that included minute examination r any defects revealed by the contest. Likewise, in every other endurance n the Haynes has either been victorious or tied for first place. A car that ways stands the test is a safe purchase.

3. Haynes cars date from 1893 and the makers are the oldest automobile anufacturers in America. The production of Haynes cars is not a sky-rocket peculation, but a steady, permanent panic-proof business that means a secure acking to the agents' promises, and makes the Haynes, again, a safe purchase.

Haynes cars are bought as investments and charged up by owners as ssets, not expenses.

Model S, 30 H. P., $2,500. Model W, 45 H. P., $3,000. Model U, 60 H. P., $3,750.

The Pierce Engine Company, Racine, Wisconsin, U. S. A., was organized in 1893, to take over and carry on the gas engine manufacturing business of A. J. Pierce of Racine who sold his first stationary gas engine in June, 1884.

The Pierce Company has continued to build stationary gas engines driven by gas or gasoline, up to the present time, the largest Pierce unit being 250 H. P. The Pierce-Racine Company was the second American builder to supply gasoline engines and was only about 30 days behind this first builder in making the first delivery of an American built gasoline motor.

This long experience of the Pierce-Racine company in gas engine building has given that concern a thorough knowledge of the gasoline motor in all sizes, and makes it reasonable to suppose that the Pierce car motors are designed with a full consideration of the conditions of the problem.

gear, progressive, in 1906; ball bearing for both line and side shafts, and has not since been changed.

The change from semi-floating to full floating rear axles was made in 1905, for 1906

wide.

THE CHASSIS FRAME

The same chassis frame is used for D and E. The greatest depth is 4 ins., $1\frac{3}{4}$, thickness $\frac{5}{32}$. The frame is flat c

Fig. 2. Pierce-Racine 1908 Gentlemen's Roadster. Same body, 2, 3 or 4 passengers, on model D or E chas prices as touring cars, models D or E. Weights 2500 and 2150 lbs. Wheel base 106, gauge 56. With full equipment and generator, the price of this Pierce-Racine roadster body on model D chassis, 40 H. P., easy 60 miles on a gooc $2,530.00. On model E chassis, with 5 lamps and generator, everything complete, the price is $2,130.00, 30 H. P., per hour on good roads.

trade. From the first, all the Pierce-Racine 4-cylinder cars have had all wheels and axles on 4 point ball bearings, which will be continued indefinitely, as they have given and are giving, entire satisfaction. The type of 4 point bearing used is adjustable, which the Pierce Company prefers to the non-adjustable ball bearings. The Pierce-Racine axles are tubular steel, both front and rear. The clutch is a plain leather-faced cone, 17 ins. large diameter, 11 degrees angle. The steering gear is a worm and trunion nut. The chassis frames are all pressed steel, 4 ins. deep x $1\frac{3}{4}$ ins. wide. The springs are all half-elliptics. Both struts and the torsion arm are fitted. The axles are tubular steel, front and rear. The stub axles are Lemoine type with 4-point adjustable ball bearings. Inside balls $\frac{3}{4}$ and outside $\frac{5}{8}$ inches dia. The Pierce designers believe the tubular front axle to be vastly superior to the I-section drop forging because it is of equal strength in all directions, while the I-section is stronger up and down than it is side-wise. The rear axle construction is fitted with 4-point adjustable ball bearings thru out. The bevel gear housing is a steel casting with an aluminum cover. The lower portion of the housing has full circular ends fixed to the steel tube axle casing $2\frac{1}{2}$ inches dia. and $\frac{3}{8}$ inch wall, by riveting and keying, no brazing being used anywhere in the Pierce-

sides parallel, 34 ins. wide thruout. A nel-steel sub-frame is fitted, 22 ins. width, to carry the motor and gear box.

THE MOTOR.

The Pierce-Racine motor is the re long experience with the 2-cycle and motor in various sizes. The marked f of the Pierce motors are extreme sin and ample dimensions of wearing su The cylinders are $4\frac{1}{2}$ ins. x $5\frac{1}{2}$ ins. for H. P., and $4\frac{1}{4}$ ins. x 5 ins. for the 30 general construction the same.

Fig. 3. Pierce-Racine 1908 front axle. The s are the Lemoine type. This illustration shows 2-p bearings, but 4-point, adjustable bearings are fitted Inside balls $\frac{3}{4}$ ins. and outside balls $\frac{5}{8}$ ins. diameter.

The cylinders have long water jac water space around the cylinders and space around the valves. The cylind dual units, cast in the Pierce foundry cylinders are symmetrical, valves on bot worked by two cam shafts. The ca

An "oil" snap ring, $\frac{1}{4}$ wide, is placed close to the lower end of the piston. The piston-pins are steel tubes $1\frac{1}{8}$ ins. x $\frac{1}{2}$ in. and 1 in. x $\frac{1}{2}$ in. respectively, hardened and ground and fixed in the pistons by screws tapped thru the piston hub and the adjacent pin wall, screws turned down hard on the square heads and retained with one pin driven beside the screw head. The connecting rods are steel castings, top end bushed with bronze of a composition of 8 copper and 1 of tin.

The wrist rod ends are marine type, with two studs and half boxes of bronze, lined with real babbitt metal, 96 tin, $3\frac{1}{2}$ copper and $\frac{1}{2}$ antimony in 100 parts.

The crank shaft wrists and journals are all the same diameter, 2 ins. for 40 H. P. and $1\frac{3}{4}$ ins. for 30 H. P. The crank shafts have 3 journals, and are in bronze half boxes, babbited.

The crank shaft is made long enough to give symmetrical connecting rods, bodies in middle of wrist bearings. The motor base and oil basin are aluminum castings, the motor base fixed to the sub-frame by four lugs.

An Oldham joint is placed between the clutch and the line shaft. The propeller shaft is fitted with two special, Blood Bros. universal joints, heavier than the regular pattern.

BRAKES

These are external and internal, on and in the 12 ins. diameter rear hub drums, model D, and 10 ins. diameter in model E. In model

wind blew coldly in our faces as the impatient hind wheels took first one side of the road and then the other to pass the front wheels. The snow was dry, the Model E had plenty of power and then some at the start, and busy Mr. Wherritt kept us from touching anything but the road surface, though the vicious hind wheels shoved the radiator towards everything except straight ahead, while the tears ran down our cheeks and our ears grew cold.

We stopped one minute at a turning blocked by a pile of packages and a Christmas delivery wagon, and 8 minutes under the railroad bridge to take up our chains, and then hustled out into the snow covered country.

There were very few stretches of clean road road surface and the car did not hold the road a little bit in the snow. The writer remarked to Mr. Wherritt thru the icicles on his mustachios that he was cold, and Mr. Wherritt cracked the film of frozen tears on his cheeks as he replied that he himself was not suffering from the heat. The tonneau passengers held their hands over their ears part of the time, and part of the time they pounded their hands on their knees.

At Addison, about half way out, the writer suggested a stop in front of a commercial emporium and everybody went in and bought caps and gloves, beautifully large and thick and warm, such as farmers wear. The writer after rubbing his fingers in the snow purchased a beautiful seal plush cap, made in London according to the label on the near-silk lining, for 50 cents, and a pair of big-fingered yellow gloves with thick knitted yarn linings for a dollar—perfectly delightful gloves, and we started after our 20 minutes

wheel a snatch which put the front back in the track and gave the deter hind wheels a chance to pass on the left they promptly did, and shoved the car across into the ditch at the right, axl in the snow. Fortunately there were no under the snow and after some few tri car pushed itself up the pike side and in road again, much to the delight of all writer took notice that Mr. Pierce d

The accompanying cut shows the Phillips quadruplex opposed water-cooled motor manufactured by the Phillips Gasoline Engine & Motor Co., Franklin and Indiana sts., Chicago.

The crank shaft is made of a hammered forging of high grade steel, finished all over and flanged to the fly-wheel. The shaft is 1–⅝″ in diameter and the main bearing is 5″ long—other bearings in proportion. The bearings are made of Parsons' white bronze. The size of the cylinders are 4–½″ and 4″ stroke, fitted with a Duplex governor and carbureter, which enables running the motor with one to four cylinders, as desired. The two forward cylinders may be operated without the two rear cylinders, when desired. The circulation is furnished by a geared pump driven by a one-half time gear on the crank shaft which also drives the governor and the cam shaft gear. The governor is so arranged that the speed of the motor is changed to suit the operator, and the speed as adjusted is maintained without any attention. The carbureter is so arranged that when the motor is running on slow speeds an extra supply of gasoline is provided without the automatic air valves. A drip-cock is furnished in the lower corner of each cy-

of in a very neat manner, by passin between the two cylinders. The weigh motor is 550 lbs. including equipment

The cylinders are made of French r fine grade cast iron, as are also the pis piston rings. The carbureter is of alu as well as the governor plate and th on top of the engine. The carbureter is polished brass tubing. The water when desired, is made of polished bras cylinders are finished in black enamel on. All bearings are provided with ments for taking up the wear. The may be run from 150 to 2,000 R. P. M

This concern is also building a 2-c air-cooled motor with mechanically op valves, and furnished with the same g ing and carbureting devices as the quad size. The dimensions of this 2-cylind as follows: 29 inches long over all; 20 wide; 17 inch fly-wheel; 3 inch face; cy 4½ inch bore x 4 inch stroke; valves 1 in diameter; valve opening 1⅝ inch motor is furnished with underneath supports. Two separate cylinder p are used in order that the exhaust m pass over the inlet, but that the inlet

MICHELIN

FRANCE, ENGLAND, ITALY, AMERICA.

Some motor car manufacturers and a good many AGENTS have not sold their cars. Not because the cars they built or sold were not powerful, fast, beautiful, roomy machines, for they were. But because these cars cost the owner so much to keep.

High cost of upkeep is fatal to large and profitable sales. The largest item of upkeep cost is TIRE cost. The car owner who says "I went through an entire year on one set of tires" makes as many sales for the CAR he drove as for the make of tire he used.

Michelin Tires reduce upkeep cost. They are famous the world over for durability and reliability. They are admittedly the Tire Standard of the world and EVERY MOTORIST KNOWS IT. Car buyers are DEMANDING Michelins to-day and GETTING them on their new cars. Agents are SPECIFYING Michelins and manufacturers—the able men of affairs who build the leading American cars—are equipped with Michelins.

Mr. Manufacturer, how will your Agents sell their cars in 1908 in the face of competition which offers Michelins on cars of your price and class? You can AFFORD to equip with Michelins to-day. The public KNOWS it and your AGENTS know it.

At the Importers' Salon over 50% of the pneumatic-tired cars exhibited were equipped with Michelins. This is according to an official count made in the presence of and signed by an official of the Salon.

tensive line of zinc, lead, copper, brass, tin, aluminum and steel novelties for use in automobile construction.

Some of the products largely manufactured by this concern are as follows: Eyelets and grommets for use on aprons and side curtains, also on patches which are placed over the defective spots in tires; preforated metal fronts for use in front section of automobile to allow ventilation to keep cylinders cool; lacing hooks, snap fasteners and buckles used in casings for extra tires. Besides these and other small parts the concern also manufactures automatic power presses, punches and dies, riveting machines, rivet heading machines; skiving machines; punching machines, kerosene oil burners, etc.

Neely Force Feed Mechanical Oiler

The main feature of the Neely oiler aside from its positive lubricating qualities lies in the accessibility of all its valves, the construction being such as to make the valves accessible without disturbing the inside mechanism. This oiler is the product of Edward Neely & Co., 244–246 Wells St., Chicago, Ill. who are prepared to furnish them in any number of feeds and any capacity desired.

The "Neely" Force Feed Mechanical Oiler; Type C—2 to feeds; capacity 8 pints; top drive.

The casing of the reservoir is made of thin teel metal, which materially reduces the eight of the oiler. The pumps which are ertical are supported by an inside plate and re fastened to the back of the reservoir. he pumps have inwardly projecting flanges etween which the cam shaft revolves, which

On January 2, the formal opening of

ne Price For Warner

uto-Meters

Never until this year of 1908 has there been a speed indicator sold at one absolutely fixed list price.

Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us—it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out—that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

SO WE'VE CUT THE JOBBER'S QUOTATIONS OUT. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

DeTamble Buggy-Type ENGINE

Prompt Deliveries

Attractive Prices in Quantities

Opens a Profitable Field For Automobile Manufacturers

The lack of a suitable, reliable engine, until this season, has greatly retarded the advance of the buggy-type automobile.

The success of the DeTamble assures immense progress in this new and fertile field of automobile construction. Its heavy sales indicate that manufacturers appreciate this.

It is a high-grade, carefully constructed engine, perfectly balanced and free from vibration. We strongly warrant each engine to deliver the rated power and keep cool. It is compact, powerful and thoroughly reliable. Suitable also for any light runabout or light delivery wagon.

Specifications:—Two cylinders, 4 x 4, double opposed. Air cooled. 10-12 H. P. (conservative rating). Weight including flywheel, 180 lbs. Overall dimensions, including spark plugs: length, 30 in.; width, 16¾ in.; depth, 19½ in.; depth without flywheel, 11½ in.

We also build the famous

CARRICO *Air Cooled* ENGINE

operator to accomplish better results in washing vehicles and at the same time save the enormous amount of water wasted in washing with the open hose. This device is manufactured by Marion Warren, of Rochester, New York.

In order to prevent damage to the highly polished surfaces of automobile and carriage bodies, due to careless handing of the hose or nozzle, the end of this nozzle is fitted with a rubber protector tip which fully encircles the outlet end. The operation and construction of this nozzle is as follows: Situated midway between the ends of the nozzle is small corrugated nut on the stem between the body of the nozzle and the sliding thumb and finger piece. This corrugated nut is intended as an adjustable gage for regulating the flow of the water. The water can be regulated so as to emerge in the form of a contracted spray, or can be subdued or forced as the operator desires. When used in spray form it is in the correct form for perfect washing with the sponge. To instantly change the flow of the water from a spray to a sharp stream it is only necessary to slide the thumb and finger fixture away from the corrugated nut; different distances producing different streams, until the full capacity is obtained. This feature is of particular value when it is necessary to remove lumps of mud, in which instance a sharp stream can be instantly had.

The Warren "Alright" Protection Tip Nozzle.

The "Wille" Renewal Piston

This is a new device recently placed on the market by P. A. Wille, 597 Gates Ave., Brooklyn, N. Y. for the purpose of increasing the efficiency of worn out cylinders and pistons of automobile, marine, and all kinds of gas and gasoline motors, thereby dispensing with the cost of reboring, and putting in new pistons. The Wille [illegible]

regular diameter of the piston in order to [illegible] for the insertion of asbestos packing between the piston and the metal ring. Upon the top of the piston is placed a metal cap which covers the entire top of the piston, and held in place by means of a bolt screwed into the center of the cylinder head.

The outer edge of the cap is made with a downward turned beveled flange, which, together with the cap itself is of the same thickness as the width of the packing space. The effect of this cap with its flange is to bear down on the packing thereby compressing the [illegible] in turn forcing the metal ring outward and [illegible] places where the bore is worn. On account of the ring being of a softer metal than the cylinder and piston the wear will naturally fall on the soft metal ring only, thus preventing any further wear on the cylinder walls.

The Battery Saver

One of the latest devices brought out for the purpose of prolonging the life of dry [illegible] when used for emergency purposes in automobiles, motor-boats, etc. is the Battery Saver manufactured by the Battery Saver Co., 1717 Locust St., Pittsburg, Pa., and shown herewith.

The makers of this device state that a battery when carried around in an automobile even tho disconnected, will in a short time become weak in amperage, due to vibration of the machine. This vibration, it is claimed, will loosen the carbons, jar the connections

The Battery Saver.

loose, crack the packing and injure the ingredients of the battery to such an extent as to make it practically useless. To avoid this trouble is the object of the Battery Saver. The device consists of a coil spring resting on a metal plate which is easily and quickly

factured by the Imperial Brass Mfg. Co. 241–249 S. Jefferson St., Chicago, Ill. This concern carries in stock an extensive line of brass and aluminum specialties and is prepared to make on order from customers' specifications work of the most difficult nature.

The "Imperial" Gasoline Tank Pump.

The Imperial gasoline tank pump is used for putting an air pressure in the gasoline tank to force a supply of gasoline to the carburetor, when ascending hills or when the gasoline tank is located below the level of the carburetor, or for pumping oil in connection with the lubricating system. It is made of the best quality brass, highly polished, and is made in three sizes listing as follows:No. 2 D, 5x1¼ ins. $4.00; No. 3 D, 8x1½ ins. $5.00 and No. 4 D, 10x1¼ ins. $5.00. Each pump is fitted with a reversible check valve which can be set to operate in either direction.

The "Imperial" Auxiliary Gasoline Tank.

The Imperial auxiliary gasoline tank consists of a polished brass reservoir (A), 4½″ wide by 7″ high, which contains a cork float operating by flotation a needle valve in the inlet chamber (B). The gasoline is supplied thru a pipe connected at (C) under pressure, and is admitted to the inlet chamber by a needle valve opening as the float falls in the reservoir. The tank as illustrated lists at $18.00 each.

This concern manufactures a gasoline control system by which exhaust pressure from the engine, operating thru their Imperial pressure regulator automatically maintains a uniform pressure in the gasoline supply tank, thus securing an absolutely reliable pressure feed of gasoline to the carburetor and permitting the placing of the gasoline tank and carburetor wherever desired or most con-

"Imperial" Gasoline System, showing exhaust feed and the auxiliary dash pump in place.

tank and forcing the gasoline thru the pipe (which is connected at the bottom gasoline tank) to the carburetor. A nection to an 8 or 10 lb. gage located dash of the car indicates the pressure gasoline, and a small pump located dash or at the seat and used for prod initial pressure on the tank when the is not running, completes the system. regulator can be set to operate at any d pressure from one-eighth of a pound t pounds.

The Imperial gasoline strainer is ma brass, the main body consisting of a cy cal brass casting chambered or cored ou a central tube which extends from th down to the middle of the cylinder, the being open at top and bottom and sl flared out at the lower end. Below the are a series of four wings or lugs exte inwardly from the body or shell of the cyl In operation the gasoline enters at the of the strainer and, striking the inner tu deflected downward and outward in a fugal manner against the wings or lugs, by separating all water from the gasolin disengaging any dirt or refuse; thus ca all foreign substances to remain at the b of the strainer where it can be drawn the pet cock. The discharge of the ga is thru the screened central tube and the top of the strainer. The list price strainer is $2.50.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

Exclusive Features of the White Limousine

The exclusive White quality of absolute noiselessness of operation is of rticular advantage in a limousine because, in a car with a closed body, any oise made by the mechanism is even more noticeable and annoying than in n open vehicle.

Another exclusive White quality—namely—genuine flexibility of con-ol, permits of the machine being guided safely and speedily through the owded city streets. The speed of the White may be accommodated to e exigencies of street traffic without any changing of gears, jerky starts or e embarrassing and sometimes dangerous "stalling" of the engine.

As regards graceful lines and luxuriousness of equipment and finish, the hite limousine must be seen to be appreciated.

The "Arco" Trunk, No. 1, showing the inner onstruction.

The Arco trunk, No. 1, holds two gallons of cylinder oil, eight gallons of gasoline, 25 pounds of ice, 2 dozen quart bottles, and a large tool tray. The trunk is made entirely of steel, and is trimmed with No. 20 gage polished brass, put on with round head brass bolts. The walls are double, and are filled with ground cork. Two large buff straps go entirely around the trunk, which is fitted with "Yale" lock and slip hinges so that the lid can be entirely removed if wanted. This trunk is made in three different styles, Nos. 1, 2 and 3, as follows, the outside appearance of all being the same. No. 1, same as illustrated, with refrigerator attachment, oil and gasoline tanks, tool box, baggage tray, etc., price $35.00; No. 2, without refrigerator attachment, but with tool tray, oil and gasoline tanks, baggage tray, etc., price $25.00; and No. 3, trunk alone, with baggage or tool tray only, price $20.00. The size carried in stock is 28 inches long, 16 inches wide, 14 inches high; tool tray, 28x 14x4 inches; gasoline capacity, eight gallons, cylinder oil tank holds two gallons.

serving as a filler to be fitted to the board. The list price is $32.50; in brass, $55.00.

The "Arco" Rumble Seat with Trunk

A new style of rumble seat for con ing touring car bodies into gentlem roadsters is here shown. By remo the rear seats and substituting a flat covering, and by using the Arco ru seat and trunk, this change can be e made. The seat is all steel with ⅜ brass beading on the top edge, only cushion being upholstered, which is nished in either red, green or leather. The prices are as follows: only, $15.00; with Arco Trunk, N $50.00; with trunk No. 2, $40.00, and trunk No. 3, $35.00.

The "Arco" Automobile Heater. A, m B, casing over muffler which retains the C, shows how the two halves of casing are nected; D, D, main hot air pipe; E, thr pipe for eliminating entirely all heat o muffler from the car; F, F, shows regist floor of the car, one for front seat and o the rear; G, cut-off valve which turns he or on, as desired.

The Arco automobile heater is bas the same principle as the well k hot-air heating system. The accom ing cut shows clearly its construction makes further description unnecessa lists at $35.00.

slightly new types of tires, the Diamond Electric and the Diamond Mechanical. As the name indicates, the Diamond Electric has been specially designed for use on electric motor cars, and for this reason is made to obtain extreme resiliency, exhaustive tests having shown that the mileage of the battery in an electric car is greatly affected by the resiliency of the tires. To obtain great resiliency they have used in this tire a fabric made expressly for the purpose and a pure rubber stock

The Diamond Electric Tire.

possessing extreme resiliency. Altho light in weight, the Diamond electric tire is very tough and has great wear-resisting qualities, we are told. For the present this tire is made only in the regular clincher type with round tread, and the list prices are the same as for their regular clincher tires.

The Diamond mechanical tire is the same in construction as the 1907 wrapt tread tire, and is for use with the usual Dunlop style of rim or with the Marsh rim. When Diamond or other tires of the Dunlop pattern are used on the Marsh rim, however, flange rings are used which

The Diamond Mechanical Tire.

are interchangeable with the regular Marsh rim flanges and which the Diamond Company are prepared to furnish at any time. This tire is not provided with a clincher bead, but is held tightly to the

Several new sizes of circulation p have been added to the line made by Lipman Mfg. Co., Beloit, Wis., inclu both larger and smaller sizes than put out heretofore. The new pump clude Model 62, gear type, 3¼-inch 2 11-16-inch wide, and 4 7-16-inch length; Model 53, gear type, 4-inch 5½-inch high, 5¾-inch length of s Model 55, gear type, 6¼-inch high, 4½ wide, 7⅝-inch shaft length; Model gear type, 4⅜-inch wide, 8 3-16-inch length, 6¼-inch wide. The compan also prepared to make special pump meet various requirements. The c system used in some of the Lipman p renders one grease cup sufficient fo the bearings.

The Lipman Electric Speed Indic have also been improved in several de Accuracy in all temperature change assured by the use of a combinatio coils on which temperature variations opposite effects so that the effects atmospheric changes, heat, cold, etc. neutralized. The new arrangement away with springs that were formerly The dials are now made of brass, silv and are all hand made.

The Lipman Company has also add its line a pneumatically operated tank a distinctive feature of which is the that it can be placed above, below c the tank, its position having no effe its operation. In appearance it resem somewhat, a thermometer, consi chiefly of a glass tube containing a indicating liquid, the tube bracket suitably spaced off to measure the va heights to which the liquid rises.

Connection to the tank is made flexible copper tube which must ente tank from the top and extend to with inch of the bottom.

As the volume of liquid increas the tank it rises in the copper tub the same time compressing the air is trapped in the tube.

This air pressure acts directly o bright red indicating liquid in the tube.

There is nothing about this gage t out of order as there are no mecha moving parts used.

Connection of tube to gage is made the back so that nothing but gage s on the dashboard. The gage is abou inches high over all. Price, finishe polished brass with six (6) feet of necting tube is $7.00.

Miller, 1223 North Eighth street, Quincy, Ill., shop rights of which are for sale.

The carburetor is of the floatless mechanical automatic type. The following is a description of its construction and operation: The needle bar (D) is adapted to regulate the amount of gasoline from the supply tank, it being set according to the capacity of the engine. The needle valve, which is located exactly in the center of the carburetor, works automatically, regulating the supply of gas in accordance with the amount of air allowed at the air intake. The lever (P), which is directly over the needle valve in an oblique

The "Anderson" Carburetor.

position, graduates the rise of the needle valve. The lever (P) is attached to the rod (M), to which is attached the throttle (N) and lever (T). The gear lever (T) is for the purpose of regulating the disk or air intake (L). The levers (P) and (E) are connected by the rod (V), thereby connecting all parts except the needle valve with a disk and spring which work automatically as soon as the thumb latch (W) is raised for the first explosion or primer. The spring (O) keeps everything closed until the rod (U), which is attached to the lever (P), is pulled out or set as desired, the rod (U) being the point at which the carburetor is controlled, as it can be lengthened to control from any direction from the position of the carburetor.

BRONZES

PLASTIC BRONZE is the best bearing metal for all purposes, under all conditions. It is hard enough to stand compression strains, yet plastic enough not to groove the shaft.

MANGANESE BRONZE takes the place of drop forgings; very strong and tough. Takes a fine polish, and does not oxidize readily.

New Factory of the Warner Instrument Co., Beloit, Wisconsin.

Warner Instrument Co. in New Home

The Warner Instrument Co., of Beloit, Wis., recently moved into its new factory. Kahn's system of reinforced concrete construction is used thruout. The roof is of the saw-tooth type. The main shop is 100 x 200 feet. The interior walls and the slant of the saw-teeth are plastered with two coats of rock plaster, which is snow white. All exposed cement work is painted with a specially prepared snow white water paint. The entire shafting system, including pulleys, are also painted white, the object in view being to reflect every possible ray of light.

The heating and ventilating is done by the blast system, and every particle of air entering the building is washed. The utmost care has been exercised in providing for the comfort of the employes.

Special attention has been given the shafting system, which is mounted on channel iron beams fastened to special cast iron brackets which were set in proper position in the concrete during the construction of the building. A line shafting, running the full width of the building, is placed near the columns of every alternate bent. This permits of belting across two bents. All shafts are fitted with D. W. F. ball bearings.

battery here illustrated. is manufactured by the Westinghouse Machine Co., East Pittsburg, Pa.

The outside containing case is of oak, with a cover of hard rubber, and an inner three-compartment hard rubber jar. This hard rubber jar is set in the wooden case in melted paraffine, which fills up the space between the rubber and wood, thereby holding the inner jar in position and serving as a lubricant if found it is necessary at any time to remove the hard rubber jar from the containing case, this being done by simply filling the compartments with hot water which softens the paraffine. In each compartment of the rubber

The "Westinghouse" Storage Ignition Battery.

jar, fitting snugly, is placed a storage battery element consisting of 7 type 'I' plates, separated by means of hard rubber ribbed, flanged and perforated separators. The elements rest upon a rubber bridge provided in the bottom of the cells. The bridge is about ¾ of an inch high, allowing that space in the bottom of jar for sediment. The mouth of each compartment is closed with a strong hard rubber cover fitting snugly around the terminals. The lead terminals of the three cells are then joined together by burning. The outside terminals of the two outside cells have brass terminals molded into same These studs are brought out thru the cover

sentative wanted in unoccupied territory. IMMEDIATE DELIVERIES.

The two cuts herewith illustrate the 1908 "Autocoil" of the dashboard type and one of the "Buck Proof" units of the same. The manufacturer of these coils, The Autocoil Co.,

136 Seventh Ave., Jersey City, N. J., claims that backfiring in gasoline motors, which is often attributed to the presence of incandescent particles of carbon in the cylinder, is in reality caused by the fact that an energized unit in a coil often affects an adjacent unit causing preignition in the cylinder to which the affected unit is connected. To overcome this difficulty this "Buck Proof" unit, as the maker calls it, has been designed and has been so named because it is said to prevent back-firing or "bucking" of the motor.

Manufacturing Co., Chicago, Ill., has recently brought out some new things, shown herewith:

"Standard" Gauge Light Fixtures. Styles A and B.

For lighting up speedometers, gauges, oilers, etc., this concern is making small fixtures with minature or candelabra sockets attached. The fixtures are made in two styles, A and B. Style A is fitted with a 2½-inch reflector. The length of bracket is 3¼ inches. It lists at $1.35 in brass finish. Style B is fitted with a reflector 1⅜ inches in diameter by 2¼ inches in length. The bracket is 3¼ inches in length. Style B lists at $1.50. These prices include minature or candelabra socket only, bulbs and wire being extra. When gun metal finish is desired, 20% extra is charged.

"Standard" Electric Tail Lamp. Styles 164 and 65.

The "Standard" electric tail lamp is in two sizes, listing as follows: No. 164, 3½-in. dia. of body, 2-in. red lens, $3.75 in black, $4.05 in full brass, and $4.80 in gun metal finish. No. 65, 4½-in. dia. of body, 3-in. dia. of red lens; in black finish $4.50, full brass $4 95 and in gun metal finish $5.70. No. 65 is equipt with Edison socket at an additional charge of 45 cents. A brass bracket is also furnished at 45 cents extra. The prices of this lamp includes miniature or candelabra sockets.

4 for the rear of the buggy type car

"Standard" Small Oil Side Lamp. Styles

The Standard gas generators are two styles. Style No. 44 and 45 a popular round type. No. 44 is 11¾ 5¾ ins. diameter of cylinder, capac list price in full brass $9.75. No. 45 high, 6½ ins. diameter of cylinder, 3 lbs., list price in full brass $12.00

"Standard" Gas Generators. Nos. 44 an

Generator style No. 47, is offered idea of filling the requirements of a generator at small cost. The heig inches, cylinder dia. 5¼ ins., carbide 2 lbs., price in full brass $8.25, g finish 20% extra.

TIRES TIRES TIRES

Greatest sale of Automobile tires ever offered to the trade and public.

We have purchased the entire stock of 1907 G & J tires. These tires are all fresh goods and all perfect, but owing to the low prices we are selling these goods the manufacturer has buffed the name, but we, "TIMES SQUARE AUTO CO." guarantee every tire to be perfect and free from any imperfection in workmanship and material.

Remember these goods are all of the highest quality Automobile tires built in this country, all wrapped tread, some flat tread, made for regular clincher and quick detachable rims.

At the low price we are selling these tires they will not last long, so mail your order at once, or call.

Remember every tire GUARANTEED PERFECT or MONEY REFUNDED.

Positively none sold other than C. O. D. or CASH WITH ORDER.

All C. O. D. orders must have sufficient money accompanying orders to pay transportation charges.

g. Co., 322–326 Dearborn St., Chicago, Ill. replaces the usual starting crank and can fitted to any gasoline automobile engine ether the same is started from the side or front of the car.

The plan on which this starter works is automatically imprison a charge of unprest gas when the engine stops and comss this charge by a forward movement of ever provided for the purpose when it is ired to start the motor again. Should the rk be advanced the lever will not kick back the tension releases instantly and allows shaft to run free backward.

e Souchet ' motor starter, with tire pump attached.

When placed on side crank cars this starter perated by a lever but on front crank cars starter is placed in front and is operated a pedal inside the car. Should the engine the imprisoned charge the charge can be laced by two forward sweeps of the lever pedal. The designer has aimed at strength, plicity and safety and the makers claim t it is impossible to be injured in starting notor with this device.

De Souchet Motor Appliance Co., also manuures a tire pump which can be attached he starter and thus operated by the motor. starter lists at $75 for the front crank e of car and $60 for the side crank type. tire pump is $15 extra.

used for the purpose of blowing dust a small obstacles from obscure places wh they may accumulate. It is made in following sizes: No. 1, 2½"x20", listing $2.75; No. 2, 2¾"x22⅜", $3.75; No. 3, 3"x24 $6.00; No. 4, 3⅓"x25⅛", $9.00 and No. 5, x32¼", $12.50. An adjustable curved mou piece of vulcanized rubber for the purpose better reaching obscure places is furnished $.90, $1.10, $1.10, $1.35 and $1.80 addition according to size.

The electric automobile extension co meets the demand for a convenient meth of illuminating, when necessary, the worki parts of an electric car. The electric bulb one of the side lamps may be unscrewed a transferred to the portable socket. T portable plug may then be screwed in socket of the side lamp. The portable soc is made of polished hard rubber in which th is embedded a phosphor bronze shell. T plug is also of polished hard rubber over part of which is attached a phosphor bro screw shell. The flexible cord is 5 feet length. The list price of the device is $2.

The battery connector offered by this co cern consists of two copper lugs, one solde on each end of a 6-inch piece of No. 18 flexib insulated conductor. The list price hundred is $6.00.

The automobile cable lug is intended to used in connection with both primary a secondary cables. It is made so that insulation and braid of the cable are h firmly in place and the ends cannot break fray. The list price per hundred, is $5.00

Trade Printed Matter

The latest book on "Hartford" Solid Motor Tires, issued by the Hartford Rubber Works Co., Hartford, Conn., contains first an informal talk on the quality of these tires, then tells about a machine for mounting them in conjunction with a half dozen illustrations of how to use the same; gives price and size tables of the various types of Hartford solid tires and closes with a guarantee against defects. The cover illustration is a conventionalized factory view with a large motor truck in the foreground.

One of the most practical catalogs that has lately come to hand is the 1908 Reo catalog just issued by the general sales agents of the Reo Motor Car Co., R. M. Owen & Co., Lansing Mich., its most unusual and especially practical feature being a recital of the constructional changes that are exemplified in the 1908 Reo. These changes are listed on one of the pages in the front part of the book, detailed specifications and descriptive matter following. For the man already familiar with Reo construction the list of 1908 improvements and the illustrations give all the information he desires and it is surprising that this fact is not recognized by compilers of annual catalogs generally. In this respect the Reo catalog is an example worth following.

Trojan Hydro-Pneumatic Wheel Co., Watervliet, N. Y., has issued a new booklet describing the "Hydro-Pneumatic" system of vehicle body suspension. The device made by this concern takes the place of leaf springs and supports the vehicle body hydraulically and pneumatically, consisting as it does of a cylinder containing oil and air and a piston moving up and down in said piston. The maker claims for the device the advantages of both springs and shock absorbers.

The meritorious features of "Fedders" square tube radiators are clearly set forth in the new catalog and descriptive booklet just sent out by the maker of these radiators, Fedders Mfg. Co., 57-59 Tonawanda st., Buffalo, N. Y. The durability and ease of repair of these radiators and their efficiency even when damaged are all convincingly set forth and the booklet appeals at once to the car owner who appreciates all the contingencies to be provided against in making and designing a radiator.

Two thousand copies of a booklet entitled "The Man, the Horse, the Automobile and the Highways" are being distributed by Lima (Ohio) Automobile Club among horse and automobile owners. This booklet is designed to break down individual prejudices and bring about courteous behavior of all road users toward each other. There is so much common sense and generous good nature in this publication that one regrets the edition were not two million instead of two thousand so that its precepts could be more widely disseminated and more firmly established in the hearts of all road users and builders.

"Sta-Rite" spark plugs will be kept in the memory of the trade during 1908 by means of a handsome, brightly colored calendar sent out January 1, by the maker of these plugs, R. E. Hardy Co., 86 Watts street, New York city. It consists of a large hanger containing a fine lithographed portrait of "A Lady of Quality," and as the calendar pad is small and the advertisement is inconspicuous, the portrait can be framed after the usefulness of the calendar is ended by the close of the year.

High Wheel Auto Parts Co., Muncie, Ind., has issued a neat little booklet containing illustrations and specifications of various parts for high wheel, buggy type automobiles. As this company devotes its whole efforts to the production of this line of parts the booklet is of special interest to builders and assemblers of buggy type motor cars. Besides the stock parts shown in the catalog the company is prepared to build parts to any specifications.

The Philip Carey Co., Lockland, Station R. Cincinnati, Ohio, has issued a new descriptive catalog of Carey asbestos coverings including automobile and marine sheet packing made of asbestos, asbestos-metallic gaskets, etc. This book is of especial interest to manufacturers requiring steam pipe coverings and other goods of similar nature.

Merchant & Evans Co., 517 Arch street, Phila., have gotten out a special catalog on the various products they offer the motor car trade. This catalog contains forty 8x11 pages enclosed in a cream colored cover all of fine stock which shows up the illustrations and type matter clearly and effectively. This large, attractive catalog shows care in preparation and thoroness in execution, indicating the vigor with which this company has entered the automobile field as well as suggesting the success it intends to achieve in this field.

The 1908 "Exide Instruction Book" and the 1908 "Exide Sparking Battery Instruction Book," recently made their appearance, being compiled and issued by the maker of "Exide" vehicle and sparking batteries, Electric Storage Battery Co., 19th street and Allegheny ave., Phila., which will forward copies direct or from any of its sales offices. As was their predecessors, both these 1908 instruction books show great care in preparation and, representing as they do the very extended experience of this prominent company; they are valuable reference books for storage battery users.

Association of Licensed Automobile Manufacturers 7 E. 42nd St. N. Y. City, has just issued its annual handbook containing illustrations and specifications of all 1908 models made or imported by members of the association. The boo kcontains 132 pages in an elegantly decorated, mottled brown cover and is printed on the finest quality paper, the cuts showing up clearly and effectively. One hundred and fourteen models ranging in price from $600 to $8,000 are shown. A page is devoted to an explanation of the A. L. A. M. formula for computing horse power.

Kraeuter & Co., 571-579 Eighteenth Ave., Newark, N. J., who have been engaged in the manufacture of small tools for a half century, have just issued a new catalog in which are listed a large number of tools used extensively by automobile manufacturers and repairers. Interest in the catalog is excited by a statement on a circular enfolding it, to the effect that "you will find money in this new catalog." Special prominence is given their "Victor Universal Plier."

Tincher Motor Car Co., South Bend, Ind., has just issued its 1908 catalog of the Tincher 4-cylinder, gasoline car. Good, clear half-tone illustrations, large, readable type in brown and a good lay-out of the matter all combine to make and atractive but dignified catalog, and it impresses one as a suitable introduction to a high grade car.

The New York Sporting Goods Company, of 17 Warren street, New York, have issued their 1908 Catalogue of Bicycles and Supplies, and a copy will be sent to any dealer who writes upon his letter-head or encloses his business card. This book is attractively gotten up, and its small size, 5x7 inches, makes it convenient to carry in the pocket.

A unique, practical and attractive calendar has been sent out by The National-Acme Mfg. Co., of Cleveland, Ohio, maker of a line of screw machines. It consists of an easel slotted to admit a pack of 8x11 sheets, two rectangular portions of the top sheet showing thru openings in the front of the easel. A sheet is provided for each month, with the calendar on the lower half of the sheet, and an illustration of a machine or part on the upper half.

Acme Non-Freezing Solution

The Acme Auto Equipment Co., 1461 Michigan Ave., Chicago, Ill., are putting out a non-freezing solution called the "Acme," which it claims will not corrode or foul the water pipes, and will not freeze at temperatures down to 35 degrees below zero, the non-freezing qualities depending of course, upon the strength of the solution. It is also claimed that the Acme solution will not boil at 260 degrees, and prevents the cooling water from boiling or foaming. One gallon of sulution to one gallon of water is the strength recommended for zero weather. Price for a two-gallon can is $2.00, and for a 5 gallon can, $4.00.

Schubert Aluminum Bodies

The Schubert Brothers Gear Co., Oneida, N. Y., the well known body builders, are now making both aluminum and wood bodies, and since last March have been supplying seven well known manufacturers of American cars with aluminum bodies. They make a specialty of aluminum bodies, altho continuing to cater to the demand for wood bodies also. They employ two aluminum beaters, highly skilled in the art, fully experienced in beating aluminum with automatic hammers.

The frame work of Schubert aluminum bodies is constructed of ash and the panel work is made entirely of hammered aluminum, with aluminum moulding thruout, and attached to the body by concealed screws. The tires are 36x5 inches all around and are of the Fisk demountable variety, the driving tires being fitted with tire chain grips.

kept on cards upon one side of which goods received are recorded and upon the other side of which the data from the requisition blanks showing the outgo is posted daily. A dumb waiter leads directly to the parts department in the display room. This stock room is a model of system and is well lighted overhead as well as from the entire front and one side. When desired, owners goods can be stored in the stock room.

City Hall Garage Co.

SAN FRANCISCO, CAL.

Mr. C. M. Rolfe of the City Hall Garage Co., 54-72 Fulton St., San Francisco agents for the Dolson cars corroborates the opinions expressed from time to time in these columns by other agents, that the majority of car sales are directly due to personal work rather than to advertising in the daily papers. He states that the City Hall Garage Co. do very little newspaper advertising but follow up a prospect until he either buys or quits. This following up in mainly by personal call demonstrations, etc., and not so much by letter.

A well equipt garage is operated in conjunction with the sales room and a high class of trade is catered to, a stiff price being charged but such excellent service given in return that all are satisfied. Cars are never taken in simply to fill up the floor. A complete machine shop fully equipt with lathes, drill presses, shapers, milling machines and power saws is also maintained and also a blacksmith shop and complete bench equipment for hand work. Second hand cars are not taken unless absolutely necessary and then they are immediately hurried off to a second hand dealer for disposal and none but new cars are offered for sale in the show rooms.

Mr. Rolfe has found outside salesmen to be as a general rule, unsatisfactory, the majority of them simply looking for pay day when on salary. No special set of rules are laid down for the salesmen, all that is desired is results and if the sales are accomplished along honorable lines, that is sufficient and as expressed by Mr. Rolfe, "Vat ve vant is orders." These men are paid both salary and commission as the salary proposition alone has been found unsatisfoctory A set amount is allowed each month for expenses and then deducted from the commission.

The agents condition could be sometimes

A Plea for Special Discounts to Legitimate Dealers

SPOTSWOOD N. J.

The gentleman from Missouri, Mr. Griep, in the December issue of your Journal, I trust has started the "ball a-rolling."

The demand, and the fact that manufacturers desire to introduce cars and accessories, has no doubt a lot to do with the present state of affairs among agents. But the day is coming when the manufacturers will have to look to those that are devoting their time and attention solely to the automobile business.

Recently, as an owner of a car, I received a price list from a house in New York city offering standard supplies at prices lower than, as a dealer, I can buy the same goods at wholesale, and if they bought $10.00 worth they will be delivered free at this cut-shop rate. These cards were sent out to those registered at the state capitol. How are we to meet such cutting of prices, and what excuse are we to offer our customers for asking more than they can buy the same goods for elsewhere.

These supplies are not the "no name" kind or the "just as good" kind but are standard well known products. The prices being in some cases lower than jobbers net prices and in others only a few cents above. The full line offered in fact are just the goods that we and the other dealers try to carry on hand to supply customers.

If the manufacturer has over produced, as in many cases they no doubt have, let them put the goods out under another brand or name, not kill the sale of something that the dealers have been advertising and working to introduce for them and maybe has a stock on hand that will be a loss. Does not this, in many cases prevent the smaller dealers from buying in larger lots?

Not alone is all of the trouble due to the manufacturer. The jobber is not particular as to whom he sells at wholesale. Any one that is agent for a car gets the regular trade discounts. This is not fair. Jones & Smith are agents for the "none such" cars, they got the agency so as to get their own cars at cost, sell a few to their friends at possibly a profit of $10.00 or $20.00 a car, no matter whether the customer is in their territory or not, and fit them up with what extras are needed at a small profit, because they are not dependent on these profits for an income thus doing the man that runs a supply and repair shop out of his legitimate profits.

If the manufacturer and jobber have to give every agent for a car trade discounts, why can't there be a distinction made, between the man that devotes his attention solely to the Automobile business and these "butcher, baker and candle stick" agents? Give the *legitimate* dealer a different discount so he can meet the price of these cut price agents.

Some time ago we made application for the agency for a certain car that we considered the best and were told that the makers did not care to place agencies with those that were in the repair business, as they thought their interest would not be so carefully looked after. After a little assurance as to the contary we secured the agency. Another manufacturer says in his catalogue "we do not allow discounts excepting to bona fide automobile dealers who are properly equipped to conduct their business successfully and serve the best interests of owners." One of these makers is selling cars as fast as they make them, the other ing and trying to force agents to take more cars than they can hope to sell, and takes Tom, Dick and Harry for agents.

How many of these T. D. &. H. agents have any facilities for looking after the cars they sell or know how? How many of them keep any extra parts on hand? They should only be allowed subagencies. If the manufacturer would stop this indiscriminate establishing of agencies and when he has a customer for a car in a certain territory, ascertain if there is a reliable dealer in that section and ask him to look the customer up and report, the condition of the agents would be improved. This of course applies only to the trade out of the cities. The manufacturers that are establishing their own agencies in the larger cities are to a certain extent helping this point.

DISCOUNTS ON PARTS REFUSED.

Some of the manufacturers go so far as to say, when parts are ordered to repair their cars, you are not agents for our cars we cannot allow you dealers discounts. Must we be agents for all the cars that come into the shop for repairs? We only wish the profits of the business would permit of it. One or two of these manufacturers, we have brought to time, by putting it to them thus, "if we can't get parts at dealers prices we will not repair your cars that come to the shop."

When there are two or three cars of one make in our section we at all times try to keep on hand a supply of such repairs as are generally needed.

These T. D. &. H. agents add to their regular business cards "agents for —Cars" and work the supply houses for trade prices, and get them.

We believe that, if the repair shop and dealers will take this matter up and stand together, the evils mentioned can be overcome, and the manufacturer of cars and supplies, also the jobbers made to see, that to us they must look for the sale of their goods.

Call the manufacturers and your jobbers attention to any cutting of prices and ask them to stop it. This and conserted action on our part will ultimately bring the trade to its proper channel. We hope others will join with us, and express their opinions.

wrenches, Frank Mossberg Co., Attleboro, Mass., is placing on the market the wrench display stand shown herewith.

The stand is made entirely of metal and is capable of holding twenty different types and

sizes of wrenches. It is 17 ins. high with a 7-in. base in diameter, and is nickle plated and highly finished. When it is full of wrenches it makes a very attractive window or show case display. The stand is offered in conjunction with three different assortments. Price is $2.00, without wrenches. The Mossberg line includes 32 sizes and styles of wrenches ranging from 5 to 10 inches long.

Every Dealer Should Read the March Journal

Every dealer should be informed not only in regard to the cars he handles but, as far as possible, in regard to other makers as well. The 8th annual complete vehicle review, which will be a part of our March number, will enable dealers to inform themselves quickly and without labor of the main features, specifications and exterior appearance of all models of all makes of American motor cars as it will contain concise specifications and illustrations of every American car on the market. These specifications will be com-

models and different makers. If no

Dealers' Spring Openings

The plan of the Chicago and New York automobile trade associations to hold a "carnival" opening week, at the beginning of the selling season, is a good one and might well be followed by dealers thruout the country in big cities and also little ones. It is especially advisable to hold special opening weeks this year in view of the fact that both national and local shows have been held early this season and many individual purchasers will have had a chance to forget before the actual selling season opens.

The "opening week" scheme gives these and other prospective purchasers another good chance to study the various makes of cars just before the opening season; it works up enthusiasm among those who might not think of buying just yet, but who would buy if interested; it excites plenty of newspaper comment and keeps the general public informed that the automobile trade is alive sowing seeds of future sale harvests and is altogether an excellent trade stimulant.

In the Chicago spring opening which commences March 28, decorations will be uniform in each of the salesrooms, and numerous attractions will be secured to make the event a success. Prizes will be awarded the three best decorated machines in a trio of auto parades to be given during the week.

Automobile manufacturers have spent a tremendous amount of money in exhibiting at national shows and a number of large local shows have been held, but a large part of the indirect benefit of these shows will be lost if the various dealers thruout the country do not get into touch with those whose interest may have been partly excited by these large shows and the "opening week" is the best method of getting hold of these partly interested persons.

Where there are no trade organizations some one dealer should get the other dealers together to decide upon the date and details of the spring opening week.

New York Automobile Trade Association to Hold an "Automobile Week"

The New York Automobile Trade Association held a special meeting at the Hotel Cumberland January 7, for discussion regarding an "Opening Week" or "Automobile Week" in the early spring, president Percy Owen presiding.

It was the sense of the meeting that such an "Automobile Week" be held in the early spring and upon request the chairman appointed a committee with Gen. Cutting as chairman to work out the details.

The next meeting was held January 15 in the same place and definite arrangements were completed. The carnival will be during the week of April 6, 1908.

"Rex" Chemical Engines for Garages

Rex Fire Extinguisher Co., 72-76 Cortlandt street, New York, are furnishing hand fire engines for use in garages and other places where a portable chemical fire extinguisher is of value. Two types are offered, one of 40-gallon capacity and the other of 30-gallon capacity. The list price of each is $200. These engines are easy to handle, being mounted on light wheels and are accepted by the New York Board of Underwriters.

Retail Notes

Temple Automobile Co., Ralph, of Chicago, Ill., has secured the agency for the Babcock electrics in that city.

Wallace Buggy Co., Chattanooga, Tenn., has secured the agency for the Motor Car Company's (Detroit) product.

Temple Auto Co., Ralph, of Chicago, Ill., has secured the agency for the product of the Rapid Motor Vehicle Company.

Worthing Automobile Company, of Fond du Lac, Wis., has secured the agency for the Jackson cars in the northern part of the state.

Walton, James A., of Atlanta, Ga., will hereafter handle the Babcock electrics in that vicinity.

Williamsburg Auto & Storage Company, of 159-161 Clymer street, Brooklyn, N. Y., has taken the agency for the Matheson car in addition to the Autocar Company.

West-Stillman Company, Broad and Race streets, Philadelphia, Pa., has taken the agency for the Pope Waverly electric.

Yarnell Auto Company, Minneapolis, Minn., agents for the Elmore car, has opened a salesroom at Second street, South, between Seventh and Eighth.

Roberts, Fred, owner of the Empire garage at Marysville, Cal., has purchased the garage formerly conducted by W. B. Grow. The acquisition will be consolidated with the Empire.

Southwestern Automobile & Motor Vehicle Company, of Muskogee, Ind., has taken the State agency for Pope Toledo cars.

Wayne Automobile Company has recently closed with the following as agencies: A. L. Standfield, Edgar, Ill.; J. L. Mott Co., Trenton, N. J., and T. S. Everitt Land Co., Redfield, S. D.

Young & Son, Charles, have filed plans for the erection of a garage 50x120 feet, southwest corner of Forty-second and Chestnut streets, Philadelphia, Pa.

Zamboni & Sons, C., Owatonna, Minn., are contemplating the erection of a first-class garage.

The Supplementary Spiral Spring Co., of St. Louis, Mo., has changed its agency in Chicago, and its product is now being handled by Messrs. Page & Palmer, 1712 Michigan avenue.

Your prospective customer will have informed himself of the good points of many cars, probably he will read the March Journal and learn the features of all American cars; can you afford to know less than he when he calls to inspect your line? Concise specifications and illustrations of all models of all American makes of cars will appear in the 8th annual complete vehicle review in the March Journal. A word to the wise dealer is sufficient. The subscription price of the Journal is $2.

Harley-Davidson 1908 Motorcycles

Detail refinements designed to add to the comfort of the rider and the general efficiency of the machine, are the chief changes on the Harley-Davidson single cylinder motorcycle for 1908. This machine is the product of Harley-Davidson Motor Co., of Milwaukee, Wis., who also have a new 2-cylinder model. The twin cylinder motor has 3⅛x3½-inch cylinders, and develops 6 horse power. It is placed in the frame at an angle of 22 degrees. The gasoline tank holds 2 gallons. Two coils are used in conjunction with a single set of dry cells. This 2-cylinder model weighs 165 pounds and lists at $275.

The Harley-Davidson single cylinder motorcycle has been on the market over four years; the first model, which was not marketed, having been built in the summer of 1903. The following year the machine was offered the trade with a 3¼ H. P. motor, and since that time the entire efforts of the maker has been devoted to perfecting this model. Naturally, therefore, the 1908 improvements are not radical. The tanks now used are rounded and the filler holes are larger, the

muffler on the 1908 machine. Th that operates the belt idler now in a slot which is provided with ment stops so that the tension on can be held at any desired degre formerly the lever would only s full on or full off position. A p feature of the 1908 Machine is i mudguards which measure 3¾ across, and the front guard is fitt a leather flap depending from th end.

The same Harley-Davidson 3¼ motor is used and is controlled, f grips, the left grip controlling the and the right grip the throttle. $210. Friction clutch to allow a gine is furnished at $15 extra, an speed gear at $40 extra.

Apache buggy attachment.

of gasoline, ½ gallon of lubricating oil, ree dry cells. Lubrication is by an

200 pounds, and with this weight in the buggy and a medium sized man on the machine, a speed it is claimed of 30 miles per hour can be attained. The manufacturers state that the power developed by the Apache motor is sufficient to carry such a load up all ordinary hills. They also state that the cost of operation of this little machine should not exceed one cent per mile. The finish is in dark blue, carefully hand rubbed. The price of the complete machine is $300.

The Philadelphia Sportsmen's Show Association recently incorporated in Philadelphia, headquarters at 216 Odd Fellows Bldg., will hold a sportsmen show in the First Regiment Armory the week of March 9 to 14. The show will include departments devoted to bicycles, motor boats and motorcycles.

The Hornecker Motor Mfg. Co., has removed from Whiting, Ind., to its new factory at Geneseo, Ill., which is now in full operation turning out 1908 models of "Torpedo" motor cycles. The Hornecker Company has better railroad facilities at the new location, and also has additional capital so that it is in fine shape to handle a large volume of business and make prompt deliveries. The new factory

$2\frac{3}{4}$ H. P., air cooled, 2-cycle motor for motorcycles. The stroke and bore are each 3 inches, and the motor is of the 3 port type. One port is placed in the piston, to do away with back firing. The head and cylinder are in one so that no joints or packing are necessary. The finished motor weighs 38 pounds and measures $13\frac{1}{2}$ inches, from the bottom of the crank case to the top of the cylinder.

Phosphor bronze bearings are used thruout. The piston is fitted with four rings, three at the top and an oil ring at the bottom. The list price with aluminum crank case is $75. The manufacturers also sell complete castings with blue prints to those who desire to finish their own motors. The only parts of the machine requiring machine work are the piston and its rings, the cylinder, connecting rod, crank case, crank shaft, fly-wheel and pulley, and the whole motor can be finished on a lathe with a 10 inch swing excepting the connecting rod, which will require $13\frac{1}{2}$ inches swing. Blue prints for each part of the machine are furnished with each set of castings and the sets list at $15 with cast iron crank case or $18 with aluminum crank case.

The makers advise us that this motor has been thoroly tested during the past season, and found it to cool perfectly and give entire satisfaction.

Ideal Racing Bar No. 11

The Ideal Plating Co., 3 Appleton St., Boston, Mass., has lately placed on the market a new Racing Bar which is cataloged as No. 11. This bar, which is here shown, drops 6 inches, and has a forward bend of $\frac{1}{2}$ inch. It is furnished in 20 and 22 inch widths, but can be

Your Customers Look to You.

If you sell a man a motorcycle and it does not give satisfaction, he lays the blame at your door

And, as your business success depends upon the satisfaction your customers get, you naturally want to sell the best all-around motorcycle on the market.

THE 1908 MERKEL

cannot be surpassed for comfort, durability and safety.

The Spring Frame, assisted in no small measure by the extra long wheel base, makes the Merkel as compared with other motorcycles about the same as a Pullman coach would compare with a freight car.

The wearing qualities of the Merkel are assured by our guarantee. We guarantee each machine to be flawless and honestly built.

In point of safety, the Double Grip Control places the Machine absolutely under the control of the rider at all times. The Triple Crown-Plate contruction with extended fork sides does away with all danger of breakage, while the double stems, telescoping into the extended sides, positively prevent twisting of the handle bars, a mishap which has caused many a cyclist a disastrous fall.

The Merkel is fitted with a 3 H. P. Ball Bearing Motor, and may be had with Magneto Ignition.

Agents wanted in all unoccupied territory.

Price, $210.00. With Spring Fork, $225.00.

Motorcycles for the P. O. Depart

Motorcycle manufacturers will watch interest a test now being made by the office department, of the value of a tri-c a mail collecting vehicle. A machine h an enclosed front carrier is now being out in Washington, and it is stated tha fulfills all the claims made for it, a larger for machines will be placed. It would that the government is acting with its tomary caution. The fact that many free delivery mail carriers have al equipped themselves with machines at own expense, and that such carriers abundantly proved the efficiency of m cycles, does not appear to have counte very much, in official estimation. Th tensive use of bicycles and motorcycle post office departments abroad might furnished reassuring evidence to our department, as it certainly would have in the case of a private enterprise tha anxious to increase its facilities for the ling of business.

M. M. THE 1908 MACHINE

That attracted the largest crowds, the most favorable comment and considered by all who saw it, the neatest and most pleasing design of any Motorcycle at both the recent great shows of New York and Chicago.

WHY?

Because of its 26" wheels, its low saddle position, its special constructed frame, its patent Motorcycle stand attached to the rear of Frame, its newly designed cylinder and head, its priming device on tank in direct contact with cupped petcock in cylinder head. Its Chain idler device adding efficiency to its splendid belt transmission, its new battery box arrangement, its slightly more rakish build, thereby permitting of a longer wheel base, a decided improvement in Motorcycle construction.

BECAUSE

Of its real Spring forks, not an apology or a joke, but, the real thing, the only Spring fork used in Motorcycle construction. A very old principle, worked out to its highest point of efficiency in its application to Motorcycles. Found exclusively and only on the M. M. for 1908.

BEST

because, it has more new features, more real improvements, gives more real service, satisfaction, speed and endurance than any other Motorcycle built.

from Indianapolis, Ind., to Denver, Colo., by Jesse L. Arnold, Ed. W. Arnold, M. C. Kinzie and A. C. Kinzie, all of Milwaukee. They used Wagner, single cylinder 3 H. P. motorcycles, and Indianapolis Double Clincher G & J Tires. Altho the trip was not made for any particular test, the outcome showed the remarkable durability of the tires, which at the finish were very little cut up after having gone over all sorts of roads.

The roads were fine from Wichita except a few sand places, altho some roads were found as good as any race track in places. Thru Missouri and eastern Kansas terrible

Riders who made motorcycle trip from Indianapolis, Ind., to Denver, Colorado.

oads were met with, some so bad that it ook the party at one time the entire forenoon to make but 22 miles. Miles and niles were traveled thru Missouri over oads where no soil was in sight, nothing ut sharp gravel and rock. In Kansas our days of rain were met with, which nade riding extremely hard on account of the roads being badly cut up by horses and travel. The roads were composed of gumbo soil which when dry is like cement, and so strong the riders state that the veight of their machines would not even break the sharp points off the ground. For even miles in Missouri the party road on railroad ties, and also rode across the Gasconde river railroad bridge as well. The whole trip was made without any damage to the tires, with the exception of wo small surface cuts on one of the tires.

The "Manson" 3 H. P. Motorcycles

is built along the lines recommende the makers of the Thor outfit, exce that the front fork is straight and a spring fork attachment is used. A str horizontal bar runs across the frame below the tank acting as a binder t frame, and as a means of holding motor in place. The combination ta only 3½ inches wide but holds two ga of gasoline, two quarts of oil and dry cells.

The machine is equipt with Thor co brake hub, Thor compensating and yie sprocket on the rear hub, Pfanstiehl Thor carburetor, Persons motor double grip control, 2¼-inch G & J, flat tread motor tires, with new double clinch steel rims, long shock sorber grips, leather tool roll and tools is finished in any color.

This machine will sell for $225. weighs about 130 pounds, and is cap of speeds up to 55 miles per hour.

Experience of Commercial Motor Car Users

Using Electric Machines for Transporting Hotel Guests to and From Railroad Stations

The Galen Hall Co., of Atlantic City, N. J., is using two electric cars for transporting hotel guests to and from railroad stations. The cars were built by the Synnesfeldt Machine Co., of Pittsburg, Pa., and are rated at 6 H. P. each, and cost $3000 each. One motor is used on each car, located in each case midway under the body. The cars have been in use for the last 2½ years.

The cars make about 12 to 30 miles per day, averaging about a mile to each trip. The company estimates that about $25.00 per month is expended for repair work and repair parts outside of battery repairs and renewals. It stores its cars in its own garage. The drivers are paid $70 per month each, no helpers being employed. A set of tires lasts anywhere from 6 months to 2 years, and a new set costs approximately $200. No serious trouble has been experienced with drivers, only the usual experiences with labor.

The greatest troubles this concern is having lies mainly with the storage batteries and the inefficient work done on them by their own makers, such as wrong arrangement of plates in cells; charging cells in reverse (on test) and consequent damage to same. It costs from $35 to $50 each time for cleaning the batteries, which must be done three times a year—this is apart from renewals of plates when needed.

They have made an improvement in the drive by replacing the original chain drive with sprockets and chains made by the Link-Belt Co., of Philadelphia. The old chains stretched badly, and would not, then, feed evenly to both sprockets. Endless tires are being used, which altho of greater first cost have been found to be more satisfactory and less expensive in the long run than butt end tires.

This concern also states that a great improvement might be made in electric controllers for automobiles. Their controller has three speeds forward and one reverse. To get the control lever exactly at the proper notch is a matter of practice and judgment, and if not properly done the contacts burn or "arc." They believe the work could be done much better if there was less extended motion required, and control effected by a device more instantly at hand and more conveniently situated.

To fully meet the requirements of their business they state that the cars should have larger passenger capacity, more reliable batteries, and battery repairs should be obtainable at less expense.

More Load and More Trips With Motor Car

After one year's experience with the commercial motor car in its business, the Bently-Gray Dry Goods Co., of Tampa, Fla., finds the same to be less expensive to maintain than horse-drawn vehicles, and at the same time capable of performing twice as much work in a given time.

This concern is using a 2-cylinder opposed 22-24 horse power delivery wagon, listed at $1500. About 5 trips, 10 calls per trip, are made daily, averaging 12 to 15 miles per day. The average load carried is 2000 pounds. The average monthly expense for gasoline amounts to $12.00, and lubricating oil $1.00. Repair work and repair parts are figured at $5.00 per month. This concern stores its own car, having found this to be the best method after having tried both ways. The operator is paid $15 per week. The car is still using its first set of tires, which are said to be in good condition.

The car replaced two one-horse light drays, costing $250 each, the horses also costing $250 each. Harness cost them $25 per set. The average monthly cost of care and feed of each horse was $20 and shoeing $1.25. The drivers were each paid $40 per month. This concern reckons that a horse depreciates 10 per cent. in value in a year and a wagon 25 per cent.

Comparing the maintenance expenses of the motor car with that of the horse vehicle equipment it will be seen that the motor car expense is only about one-half that of the horse vehicle, in spite of the fact that the car does twice as much work. The most needed improvement in motor cars, as suggested by their experience, is to use better material in the construction of those parts most used, and to use brass

Hosted by Google

instead of iron castings in the pump and other parts. They have not had any trouble lately with their drivers, but state that the worst trouble they formerly experienced was on account of drivers quitting without notice and their lack of interest in the care of the car. In order to fully meet the requirements of their business they state the car should be able to run thru sand and should always keep in order. They state their main trouble has been in defective parts due to lack of good material in construction.

Logan Car Demonstration in Milwaukee Shows Advantages of Commercial Motor Car Use

A recent demonstration made for Gimbel Brothers, of Milwaukee, Wis., by the Commercial Auto Co., dealers in Logan cars for Wisconsin, with a Logan truck, showed conclusively the superiority of the commercial motor car over the horse-drawn vehicle.

The car used was a 4-cylinder Logan Model R delivery wagon, listing at $1800, and the result was certainly such as to attract attention and awaken the liveliest interest among business men who are figuring on the cheapest and quickest way of getting goods to the purchaser.

A trip account of the four days is as follows: November 23, morning trip, 3 wagons displaced, 100 deliveries made in 1 hour and 20 minutes; afternoon trip, 2 wagons displaced, 110 deliveries made in 1 hour and 40 minutes; total gasoline consumption for the day 3 gallons, and oil 1½ pints. November 24, morning trip, 3 wagons displaced, 80 deliveries made in 2 hours and 30 minutes; afternoon trip, 3 wagons displaced, 75 stops made in 1 hour and 15 minutes; total consumption of gasoline and oil, 3½ gallons and 2 pints, respectively. November 25, morning trip, 4 wagons displaced, 160 deliveries in 2 hours and 30 minutes; afternoon trip, 4 wagons displaced, 186 deliveries made in 2 hours and 15 minutes; 4½ gallons gasoline and 2 pints oil consumed for the day. November 26, morning trip, 4 wagons displaced, 150 deliveries made in 4 hours and 45 minutes; afternoon trip, 4 wagons displaced, 120 deliveries made in 4 hours and 30 minutes; 9 gallons of gasoline and 2 pints of oil were consumed for the day. Gasoline at 11½ cents a gallon figures to $2.50, and oil at 50 cents a gallon figures to about 47 cents, or a total of $2.97.

As will be seen from the foregoing, nearly 1000 deliveries were made in less than 21 hours actual running time, with a consumption of 20 gallons of gasoline and 7½ pints of lubricating oil, costing together a total of $2.97.

The car displaced from three to four wagons, and drivers of the same. The Commercial Auto Company claims that the saving would more than pay for the cost of the car within a year, and a little figuring will show that under ordinary circumstances the car would pay for itself well within that time.

Waltham Car Makes Waltham-New York Round Trip

The Waltham Manufacturing Co., Waltham, Mass., recently made a trip from Waltham to New York and return with one of its 14 H. P. water-cooled parcel cars with paneled wood body, to show its efficiency in the commercial field.

The start of the trip was made from Waltham at 1.30 P. M., November 4. The load carried was 875 pounds, which included three passengers. Worcester was reached at 2.50 P. M., the running time being one hour and 20 minutes. From Worcester to Springfield the time consumed was 3 hours and 40 minutes; the total time so far was 5 hours for the 89 miles. The start from Springfield was made at 6.30, Tuesday morning, from where the car traveled over excellent roads via Hartford, New Haven, Bridgeport and Stamford. At 2.10 P. M. the car arrived at the New York Branch of the Waltham Manufacturing Co., Forty-ninth and Broadway, and a record was made of the time and odometer reading. The morning's run showed 155 miles, covering a total elapsed time of 7 hours and 40 minutes. The total running time for the entire distance of 244 miles was exactly 12 hours and 40 minutes. So far 15 gallons gasoline and 1 gallon of oil were used. During the New York Show week the car was kept constantly in demonstration service. After that the car was taken to Newark for further demonstration to various customers. On Wednesday morning the return trip from New York to Waltham was started. A stop was made at New Rochelle, N. Y., for one hour and a half to give several demonstrations. New Haven was reached at 6.10 P. M., a distance of 80 miles from New York, the total run, including demonstration, being nearly a hundred miles. At New Haven a new set of spark batteries was put in the car. At 8.30 P. M. the car left New Haven and proceeded by moonlight to Waterbury, arriving there at 9.50.

When leaving New Haven the car was driven over the road via Cheshire street, but after passing under the Meriden & Waterbury Railroad it was decided to give the car an unusual test to ascertain what it would do; therefore the car was driven over the old stage road to Waterbury over the mountain. This road is extremely rough and rocky and very steep. The wheels slipped repeatedly, and it was only by means of putting rocks under the wheels and jumping the car ahead a yard or so at a time that it was possible to get up the hill at all.

Thursday morning the car proceeded to Waterville, a suburb of Waterbury, and

"Thomas" Chassis in Fire Fighting

By a simple but ingenious arrangement,
C. Webb, the former automobile racing
an, who is now manufacturing motor fire
paratus in Joplin, Mo., has converted a
homas Flyer chassis made by E. R.
homas Motor Co., Buffalo, N. Y., into an
tomobile fire engine, repeated tests of
hich have shown excellent results.
Mr. Webb built his fire engine by placing
rotary pump on two cross frame mem-
rs in the rear of the transmission con-
cting the pump gear with the transmis-
on by a shaft running from one of the
xiliary shaft gears and controlled by a

Fire department witnessed these tests a
were enthusiastic over the results. W
a rotary pump smaller than the one now
use on the car, a stream of water w
thrown completely over one of the thr
story concrete and steel buildings.

Mr. Webb selected the Thomas, becau
of its combination of speed, strength,
liability and general construction. He h
contracted for a number of Thomas Fl
chassis and more of the new engines a
now in the course of construction.

A 3-ton Lambert Truck, used in the

The Standard Gasoline and Electric Trucks

The Standard G. E. Power Co., Fiftieth and Lancaster ave., Philadelphia, Pa., are placing on the market a line of gasoline electric commercial vehicles, the first of which, a two-ton truck with stake body, was finished and on the road about the 1st of September, 1907, since which time it has been thoroly tried out. This machine, with slight modifications, fitted with a motor of the company's own manufacture of the two-cylinder opposed type, and made in one and two-ton sizes, will constitute the 1908 line. These machines are after designs by Mr. J. C. Speirs, engineer of the company and are built under his personal supervision.

The following is a brief description of the present truck, the principals of operation of which will be used in the construction of the new models. Altho a gasoline electric combination is used, it is entirely different from any previous system observed by the writer. The two-cylinder motor is disposed cross-wise under the floor boards, at the front, and a prolongation of its shaft carries a small shunt-wound generator with an 80 volt, 40 ampere hour battery floating on the line. This generator is so arranged that it automatically changes from a generator to a motor and vice versa, the changes being regulated by the engine speed. It is comparatively small, being but 2½ H. P., and is not, as is usual in combination systems, intended to drive the truck, but is to a large extent, a governor on the engine so arranged that when the engine speed drops below normal which with the present motor is 1000 R. P. M., the generator automatically becomes a motor, taking current from the storage battery and its torque tends to keep the engine up to its normal speed where it is capable of developing sufficient driving power. Of course, if road and load conditions are such that even at normal speed the motor is not sufficiently powerful to carry the truck, a gear shift would be required, but it has been found that all ordinary hills can be taken without difficulty as the motor is not allowed to drop below a speed at which its pulling power is very nearly a maximum. The advantages of this can be readily seen, as it is well known that the gasoline engine when slowed down below its best pulling speed very rapidly loses power, and its rate of revolution is much more quickly lowered under these conditions to a point where it has very little or no pulling power. With the engine running about its normal speed the genertor is charging the batteries, so that the cells are always well charged and ready for duty. It will thus be seen that the essential action of this small light weight generator is that of a governor on the engine, and is not intended to drive the truck except in cases of emergency when for example, for any cause, the engine might be completely disabled, the battery will supply sufficient current to carry the truck several miles.

Plan of G. E. Truck Chassis, showing the compact generator on the forward extension of the engine shaft, the arrangement of the two-cylinder opposed motor, clutch and combined change speed gear and jack shaft, by the Standard Roller Bearing Co., Philadelphia, Pa.. The battery consisting of four trays of 10 cells, each 41 Amp. Hrs., is spring suspended at the rear as shown. This Gasoline and Electric truck is peculiar in that the generator when automatically changes to a motor does not drive the truck, except in case of emergency, but simply acts as a governor on the engine to keep it up to its normal and effective working speed, as fully described in the text.

GENERAL ARRANGEMENT.

The present motor is 5½x6, and arranged as stated crosswise at the front under the high seat and is accessible by the removal of two large side panels. Its shaft is connected as usual by means of an ordinary leather faced cone clutch, about 16 inches in diameter by 2-inch face, to a three speed sliding gear the case of which is integral with the housing of the differential on the jack-shaft. This change speed and jack-shaft combination is, in fact, one of the Standard Roller Bearing Company's transmission rear axles for

Hosted by Google

is change speed gives three forward eeds and one reverse, but this has been nd unnecessary and the new machines l probably be provided with simply a and high speed gear and reverse of same general type. The reduction in bevel gears is three to one, and the in reduction is four to one, with 42-inch r wheels which it will be noticed are y large, gives a maximum at normal gine speed, as about 10 miles per hour. e large chain is used in order that its gth of life may be great. Doubtless a aller chain would carry the load but uld wear and show stretch much more idly. Extremely large rear wheels are o fitted and carry sidewire solid tires four inches face, and it has been found m past experience altho the initial cost large wheels and tires was somewhat her, that in the long run, owing to ier riding qualities and greater tire face, the wear and replacement was ough less to more than offset the high tial cost.

or acting as a motor tending to keep engine up to a good working speed. T charging and discharging goes on entir automatically and the volt and amme on the foot board indicates to the driv the exact condition under which he is r ning. Upon encountering an exceptiona stiff grade, the controller handle is plac in the third notch which puts the batter in series only, giving 80 volts. Th nearly all ordinary hills can be taken w load on the high gear, but if necessa the low speeds are had as a reserve. T low gear is of course used for starting.

SELF-STARTING AND BRAKING.

It will be noticed that there is no nec sity for a starting crank on this truck a none is provided, as the engine is turn over when starting by the electric mot The usual gear shifting lever operating the selective principle is provided a comes up thru the floor boards in a c venient position for the driver. There a two pedals, one of which controls t mechanical brakes on the rear whee

ing the foot plate. The size of these brakes is such that they are much more than sufficient to stop and hold the truck on any hill, the pressure in fact being so light, owing to the large area, that long wearing life is assured. The other pedal operates the clutch and is entirely independent of the brakes. Another feature which is peculiar to this type of gasoline electric combination is the fact that when the motor is throttled and the truck on a down grade is driving the generator, thus charging the batteries, a very decided braking effect is produced even on the high speed and when the intermediate or low speeds are thrown in, of course, the effect is largely increased, being so great in the low gear as to bring the machine to a stand and hold it on a very steep grade. This action is taken advantage of in driving to save the brakes, as all ordinary hills can be descended at a moderate speed with the loaded truck without applying the mechanical brakes at all. At the same time, this makes the total operation of the truck much more economical, as the batteries are, of course, being charged at this time. The spark and throttle levers are placed as usual in trucks, just below the hand wheel on the steering column.

The battery used is just as light and small as can possibly be carried, and consists of four trays of 10 cells, each 41 Amp. Hrs. It is slung in a helical-spring-suspended box at the rear, this arrangement taking the excessive jar from the battery. The battery weighs about 400 pounds, and the two-ton truck complete about 5,000.

FRAME SPRINGS AXLE.

The frame is composed of 5-inch channel iron well braced in the corners and with the spring hangers of special cast steel securely riveted to it. The average tensile strength of these steel castings as shown by recent tests, is between seventy-five and eighty thousand pounds per squarre inch. Semi-elliptic springs are used at front and rear, these being 3-inch wide and perched in each case on top of the axles. The rear spring block forms the brake support and also the fulcrum for the radius rod. The rear springs are not shackled at either end, but are free to slip in guides riveted to the under side of the frame side members, the chain distance being maintained by adjustable radius rods. The front springs are 44-inch in length, and the rear 48-inch, and are ample to carry considerable overload. The front springs fit into a steel casting forming a spring hook and secured to the under side of the frame cells, while their rear ends are shackled. The axles are solid steel of square section.

The truck is fitted throuout with roller or annular ball bearings. The front wheels are 36-inch in diameter and fitted with 3½-inch solid side wire tires. The rear wheels are exceptionally large, being 42-inch in diameter and carrying 4-inch tires of a similar kind, which is small for the loads carried, but owing to the increased size of the wheel these tires have given satisfaction. The platform is 10 feet 4 inches long and 5 feet 2 inches wide. The wheel base is 96-inch and gage 60. However, whenever desired the gage will be made to suit purchasers, as will also the width and length of the platform, or the style of body. This is often very convenient as in some western cities, it is very essential that the tread be such as to permit of driving on the street car tracks, as the roads in the outskirts are often otherwise impassible.

The new trucks will probaly have longer platforms, a longer wheel base and somewhat greater overhang at the rear. The seats are of the individual bucket automobile type, of such form that the driver never need pay any attention to keeping his seat when the machine side-lurches and can give his entire attention to the truck's manipulation. An 18 gallon gasoline tank is carried under the seat and the radiator is carried at the front, the filling cap protruding slightly above the forward upturned portion of the foot boards which serves in lieu of a dash. The side lamps and tail lamp are fitted with incandescent globes, current being supplied from the storage batteries.

The prices and equipment of these machines will be announced later.

The Studebaker Automobile Company's New York branch recently sold to the H. B. Claflin Company, of that city, the sixth Studebaker truck in their delivery equipment. In delivering this truck Studebakers hauled two horses in the truck with the replaced horse drawn truck trailing on behind, demonstrating to the people along Broadway the ability of the motor truck to entirely replace horse-drawn vehicles. The sight of horses being hauled in a motor truck with the horse-drawn truck trailing after naturally attracted much notice and called attention pointedly to the fact that the motor is rapidly replacing the horse for commercial vehicle propulsion.

About the middle of December the Logan Construction Co., of Chillicothe, Ohio, shipped fourteen 4-cylinder delivery wagons to the St. Louis Post Despatch, which inaugurated a motor delivery of its papers thruout the city of St. Louis and its suburbs. The cars are the regular Logan Model "R" delivery wagon type, equipt with a 20 H. P., 4-cylinder, air-cooled motor, and with a capacity of 1500 pounds paying load.

MOTOR BOAT DEPARTMENT

Marine Coming Events

February 3-8—Power Boat and Sportsman's Show, Convention Hall, Buffalo, N. Y.

February 20-March 7—New York City, Madison Square Garden, Fourteenth Annual Motor Boat and Sportsmen's Show.

March 9-14—Sportsmen's Show. J. H Beck, Mgr. Philadelphia, Pa.

March 16—Fourth Annual Motor Boat Carnival at Palm Beach, Fla.

April 6-11—Buffalo, Convention Hall, Motor Boat and Sportsmen's Show. D. H. Lewis, Mgr.

The Chicago Motor Boat Show

During the first week of January the second annual motor boat show under the auspices of the American Association of Engine and Boat Manufacturers was held in the Coliseum at Chicago, under the direct management of Chester I. Campbell. The building was tastefully decorated with flags and bunting, flags of all nations hanging from the ceiling. The attendance was very much larger than at last year's show and every thing was in readiness when the show opened on New Year's Day. Altogether the results showed that every preliminary detail, necessary to a successful show, had been attended to, and the great success of this show was founded on thoro preparation; plenty of publicity and commonsense methods as well as on the growing and very live interest in motor boating that exists in the west. The same woman's orchestra that furnished the music at the New York Show also officiated at Chicago.

The display of complete craft was very comprehensive, the smallest boat shown being an 8-ft. dingy and the largest a 40-ft. cruiser. One of the most attractive exhibits in the boat line was a 40-ft. speed launch, shown by Chas. L. Seabury Co., with teakwood planking. A 27-ft. boat exhibited by Madison Boat Co., also attracted more than oridnary attention. It is finished in quartered oak and has electric headlights. The exhibit of Pope Boat Co. included a fine mahogany boat 24 ft. long and fittingly named the "Pope Superba." In this craft a 2-cylinder opposed motor is used and is entirely hidden from view under large, upholstered seats. The upholstery is in red leather and in conjunction with the solid mahogany finish makes a specially elegant appearance. An 8-ft. dingy was shown by The Weckler Boat Co. This craft has a 4-ft. beam and will carry five men. Odd names were not lacking, the limit in this respect being, perhaps, the "Lemon," the name of a fast, trim boat shown by the Detroit Boat Co. It measures 28 ft. in length and is equipt with a 40 H. P. Rex engine. The finish is in bright lemon color, whence the craft gets its name.

Besides the concerns named, other prominent boat makers at the show were; Hankscraft Co., Pierce Engine Co., Truscott Boat Mfg. Co., Inland Lakes Co., Hunter-Weckler Boat Co., Matthews Boat Co., Racine Boat Mfg. Co., Outing Boat Co. and Reliance Boat and Machine Co.

Like the complete boat exhibits, the exhibts of motors was also all comprehensive, two and four cycle motors of all sizes and types being shown. Many of the exhibits were the same as at the New York show, but there were not as many exhibits as at New York. The most extreme novelty in the motor exhibits was a two cylinder motor in one of the cylinders of which the suction and compression of the charge takes place while in the other the expansion and exhaust are performed. There is no clearance above the piston, so that thoro scavenging of the cylinder is assured. Motors were exhibited by Ferro Machine & Foundry Co., Rothburn Lacy Co., Cushman Motor Co., Auto Parts Co., Gray Motor Co., Pierce Engine Co., Sterling Engine Co., Standard Motor Construction Co., F. A. Brownell Co., Buffalo Gasoline Engine Co., Racine Boat Mfg. Co., Vim Motor Mfg. Co., Truscott Boat Mfg. Co., Termaat & Monohan, Waterman Marine Motor Co., Detroit Engine Wks., Hankscraft Co., H. C. Dornan Co., Continental Motor Mfg. Co., Gas Engine Power Co., Milwaukee Auto Engine & Supply Co., Comet Motor Wks., Phillips Gasoline Engine & Supply Co., Lamb Boat & Engine Co., Goshen Motor Wks., and Sterling Engine Co.

Among the new accessories exhibited was the "Paragon" reverse gear, shown by Evans Stamping and Plating Co., the "Auto-Marine" separable spark plug, made by Legvard Bros. and a line of force feed lubricators shown by Baker-Churchill Co. The exhibit of the Duplex Coil Co. attracted much attention on account of a battery of 32 spark plugs, which kept sparking thru the medium of a quad coil and an 8-point distributor.

A motor boat club at Appleton, Wis., has been organized with an initial membership of 100. It will erect a club house on the Fox River near Appleton. Forty boats of all description are owned by members of the club.

50 H. P. "20th Century" 4-cylinder Marine Motor.

New 50 H. P. "20th Century" Marine Motor

New York Launch, Yacht & Engine Co., Morris Heights, New York City, has added to its line of "20th Century" marine motors a 4-cylinder model of 50 horse power. The cylinders are 9x10 inches and have large pockets on the side so as to allow exceptionally large inlet and exhaust valves. Priming cups are provided. Ignition is of the make and break type, current being furnished by a low tension magneto. Oiling is done by a mechanical lubricator.

All the 1908 "20th Century" motors are fitted with hot water jacketed throttles of the piston type believed to be a big improvement over the butterfly and shutter valves heretofore used both from a mechanical point of view and because of their economy of fuel. The 1908 line includes 2, 3, 4, and 6-cylinder models, ranging from 10 to 105 horse power.

The "Skipper" Marine Motor

Gray-Hawley Mfg. Co., Detroit, Mich., bought out the entire machinery, stock etc. of the Saint Clair Motor Co., at receiver's sale and has installed the same in its own factory where it is continuing the manufacture of Skipper marine motors formerly made by the St. Clair Co. Gray-Hawley Mfg. Co., has improved the motor but has made no radical changes in the motor which is here illustrated. Five sizes of this motor are made, 3 single cylinder motors of 2, 4 and 6 H. P. respectively

and is operated by an eccentric.

The gas is not admitted to the cran but is admitted to the passage above the case and only pure air admitted to th mixing with the fuel as it passes from th to the cylinder. Ignition is by jump and the plug is placed centrally in the Engine speed can be controlled on eith spark or throttle. End thrust of th peller shaft is taken by a ball bearing

To escape the Dangers of the Dead Engine and the Innumerable Hazardous Situations in which the Motor Boatman may find himself, there is Positive Need that every Motor Boat Should be Equipped with

the ROPER Safety Propeller

With the Roper Safety Propeller the engine never goes dead and never races. The boat is always under absolute and perfect control. You can start, stop, slow up or run at any speed desired, ahead or astern, without jerk, jolt or jar to engine, boat or boatman. One lever, one motion, does it all. The *only* propellor that can accomplish such results. The *only* Safety Propeller made.

"IT IS SIMPLY IMMENSE—TOO MUCH CANNOT BE SAID IN ITS FAVOR"

"I am glad to report perfect success and satisfaction with the new speed-controlling and reversing propellor you put on my launch a few weeks ago. It is simply immense. It eliminates all the unpleasant features connected with running naphtha launches with the old-style propellers. I can now control my launch as well as I can my horse, can go fast or slow, forward or backward, or stand still, at will. I can run very slowly over rocks or bad places without any danger, which was absolutely impossible to do with my old propellor. Too much cannot be said in its favor."

—J. G. ROWELL, Sunapee, N. H., District Manager U. S. Hame Co., Buffalo, N. Y.

Hosted by Google

The Automatic Machine Co., Bridgeport, Conn., has been confined to heavy duty marine motors for use in oystering and freight boats, but for 1908 this company is offering in response to an insistent call from its customers, medium weight motors suitable for motor boats or as an auxiliary power in sail boats. The company's experience in building motors that must stand the hardest kind of use and abuse has been of great advantage in designing this new medium weight line, and it is to be naturally expected that the "Automatic" medium weight motors will stand up under severe service. The necessity for simplicity in operation in their oyster boat motors has been the cause of similar simplicity on designing the new line. Hence two very valuable qualities in a marine motor have had their due attention from the start in the design and construction of the "Automatic" medium weight motors,, which are made in 1, 2, 3 and 4-cylinder forms, cylinders 5½x7, 7½ x9 or 10x14.

The 1908 "Automatic" 2-cylinder Marine Motor.

Several distinctive features are noted in the new "Automatic," one of which is the contained reverse gear. An extra heavy thrust bearing is provided. The balance wheel has a split hub. Separate cam gears are provided for each cylinder. The exhaust outlet pipe is water jacketed. The ignitor is attached without the use of a gasket. The intake valve seats are entirely separate from the cylinders. Separate eccentrics operate the air and water pumps. All the piping, valves and valve seats are easily dis-assembled.

All these motors are designed for pilot house control. An option is given on Schebler, Kingston or Holley carburetor. All parts are made interchangeable. The motor here illustrated weighs 310 pounds, is 69½ inches long over all and has a base 24 inches wide. The height from the center of the shaft is 32 inches. Speed

1908 "Caille Perfection" 5 H. P. Marine

in design from 1907, except for refinements, any "Perfection" mot furnished with an elevated gear c timer, or with timer on the shaft.

The 5 H. P. engine embodies man tinct improvements. It combines a range of speed and power with suff weight to withstand any strain it m put to, and it has the handsome finish is given all "Perfection" motors.

This 5 H. P. engine is supplied w large multiple sight-feed oiler which cates every working part. The cyli are cast from a specially prepared, t strain, resisting mixture of iron, an tested under hydraulic pressure b being machined. They are ground the pistons perfectly, insuring high pression and maximum power, and surrounded by a water jacket of proportions for proper cooling with e at highest or lowest speed.

The piston is ground to a mirror and fits the cylinder perfectly. It c three rings pinned in position. Conn rods are made from extra quality b casting and babbitted at the crank end. Bronze is used in preferen steel. All bearings are babbitted wi highest grade babbitt obtainable, and tam Ball Thrust Bearings are used out. The crank-shaft is a drop fo machined and ground to 1-1000-incl tapering crank-shaft is used, and th wheel is keyed and securely lock place with a large lock nut.

Ignition is by the jump spark sy

The engine is equipped with the P tion double muffler system.

For Cleaning Auto Bodies

It's good to see how quickly Mobo removes mud, grease and dirt from an automobile body. It doesn't matter how long the car has gone without cleaning, or how thick the dirt may be—off it comes, easily and quickly if you use

MOBO

Automobile Cleanser

Not only does it remove all the dirt, but does it without marring or scratching the varnished surface, and without dimming the lustre in any way. That's Mobo style.

Mobo is composed of pure vegetable oils, and contains nothing rough to mark the smoothest surface. It is the ideal automobile cleanser.

Prevents the varnish and paint from cracking and blistering. Keeps the car looking new. It's the best sold to-day. Try it once and you'll understand why.

Put up in 3 lb. and 6 lb. cans; also in tubs, half-barrels and barrels. Can be had at the following supply house:

WILLIAM GILMORE
Automobile Supplies
BROAD AND VINE STREETS
PHILADELPHIA, PA.

and at all good automobile supply stores in all leading cities.

Send for our Mobo booklet —*"How to Clean Well Varnish and Paint on an Automobile."* It's free.

Roller Timer

THE new Wico Ring and Roller Timer is more simple and accessible; more compact and durable; has larger conducting and wearing surfaces; is smoother running and more economical than any other timer.

The Ring, when rolled upon a contact point, acts as a direct conductor for the electric current into the case proper, bridging a gap of about one-quarter of an inch, reducing the resistance to practically nothing. It, furthermore, distributes the action of the arc made when the contact is broken over its entire periphery. This loose ring consequently takes practically all mechanical wear from the roller inside and the action of the current outside over an area much greater than the combined areas of similar surfaces on a number of the ordinary types of roller timers.

a line of 4-cycle marine engines, under the trade name "Little Sampson." The "Little Sampson" engine is light, compact and powerful. The working parts are enclosed in the crank case, but are readily accessible and are lubricated by splash. The cylinder head and valve chambers are thoroly water jacketed. All parts are interchangeable and it has been the aim of the designer to simplify the construction at every point, so that persons unfamiliar with gas engines can operate the Little Sampson successfully.

The "Little Sampson" single cylinder, 4-cycle marine engine.

A close grained hard iron is used in the cylinder, and the valves which are of the poppet type, are made from the best nickle steel. The valves are of generous proportions and are easily accessible. The cams are of the cone type, accurately machined and hardened. The connecting rods are of phosphor bronze and the crank shaft is forged from a solid billet of 40% carbon steel. The correct balance is obtained by fastening counter weights to the crank arms. All gears are enclosed and run in oil. Bearings are of Parson's white bronze. Jump spark ignition is employed a storage battery furnishing the current.

Heitger Marine Carburetor

The Heitger Carburetor Co., of 205½–207½ W. South St., Indianapolis, Ind., have brought out a marine type of the Heitger Carburetor known as model B. This marine Heitger carburetor is here illustrated in section and the various parts are designated by letters and numbers explained in the caption beneath the cut. This carburetor has no moving air valves or springs actuated by suction. The

Producer Gas Motor Boat

Stephen A. Hasbrouck, M. E. of the Hasbrouck Motor Mfg. Co., New London, Conn., said to have successfully operated a motor boat on producer gas and that his company prepared to furnish producer gas outfits r motor boat use. A demonstration of his s producer was made in the "Gloria." a -ft. craft driven by a 25 H. P., 4-cylinder, cycle Hasbrouck motor, and the cost of erating the motor on producer gas was o thirds of a cent per mile. The "Gloria" s an 11-ft. beam, is 5 ft. deep and draws ft. of water. She is a heavily built converted steam yacht.

The plant takes up very much less space an steam and weighs much less. It needs ry little attention and requires charging ly every three to five hours. The gas is ade from hard coal of nut or No. 1 buckheat size. The coal is fed through a hopper the top of the producer into the fire pot ere it is burned. Air is drawn through this rning bed of coal and by chemical action rms a gas. This gas is passed through a ubber and then out to an ordinary gas

1909.

January 18-23—Annual Automobile Show in Madison Square Garden, under auspices of Association of Licensed Automobile Manufacturers, 7 E. 42nd St., N. Y. City.

February 1-6—Chicago National Automobile Show; National Association Automobile Manufacturers, N. Y, City, S. A. Miles, Manager.

Hosted by Google

A. A. A. Executive Committee Meeting

At the February meeting of the A. A. A. Executive Committee held on the 6th ult. several additional directors were elected. As new clubs and state associations are admitted, additional directors representing these clubs and associations will be elected; as it is the policy of the A. A. A. to have all state associations and all unfederated clubs represented on the board of directors. After the March meeting which is scheduled for the third instant, the Board of Directors and the Executive Committee will endeavor to hold meetings in other cities than New York so that more directors will be able to attend. At the February meeting the following racing board was appointed: Jefferson De Mont Thompson, (Chairman), Frank G. Webb, (Vice-President), Frederick H. Elliott (Secretary), W. K. Vanderbilt, Jr., Ira M. Cobe, Asa Paine, Benjamin Briscoe, Dave H. Morris, J. J. Mann, A. B. Lambert, George L. Weiss, Harry W. Knights, Harold H. Knowles, Rossiter Worthington, Henry Ford, H. A. Bonnell, Charles J. Swain, Lewis R. Speare, A. R. Pardington, Thomas Henderson, R. Lippitt, A. L. Riker, Percy Owen, S. A. Miles, Alfred Reeves, A. G. Bachelder, Geo. G. Greenberg, E. R. Thomas (Buffalo), S. M. Butler, S. L. Haynes and H. L. Bowden. The new technical board will take the place of the technical advisers formerly appointed.

Definition of Amateur

A special committee of the A. A. A. was recently appointed to prepare new racing rules and on Feb. 19 prepared a report which was submitted to the Racing Board on Feb. 24. One of the most interesting features of the new rules recommended by the committee is the definition of an amateur, which is as follows: "A man who has never driven or raced a motor car for pay, either in cash or any other valuable consideration; or competed for a cash prize; who does not make his livelihood or any part of it, as a result of racing or driving, either as a demonstrator, tester, or chaffeur; who has not otherwise received financial reward for engaging in competition; who has never been declared a professional by any sport-governing body or who, having been so declared, has been reinstated either by such body or by the Racing Board of the A. A. A."

Budlong Leaves A. L. A. M. to Join Packard

An addition to the administrative staff of the Packard Motor Car Company, of Detroit, brings to it, as assistant general manager, Mr. Milton J. Budlong, manager of the Association of Licensed Automobile Manufacturers. He left the association to join the Packard forces March 1, to assist Mr. Henry B. Joy and Mr. S. D. Waldon in executive affairs.

A. M. C. M. A. Annual Meeting

The annual meeting of the American Motor Car Manufacturers' Association was held on Saturday, February 8, at Detroit, Mich., at which election of officers took place. Benjamin Briscoe was re-elected chairman of the Committee of Management, and the following other officers were also re-elected: R. E. Olds, vice-chairman; H. O. Smith, treasurer; W. H. Van Dervoort, auditor; Charles E. Lewis, director. William Mitchell Lewis was elected secretary; B. F. Everitt and C. G. Stoddard directors.

All the reports showed prosperity during the past year and promise of a prosperous year to come. The Show Committee reported having been able to rebate 25 per cent. to exhibitors at the Grand Central Palace show. The secretary's report showed that 15 new members had been admitted during the year. Five thousand dollars were appropriated for the use of the Good Roads Committee. The invitation of the A. A. A. to co-operate with it in the promotion of contests was accepted, and a committee, consisting of H. O. Smith, Walter C. Marmon and A. C. Newby, was appointed to take charge of the matter.

Annual Meeting of Automobile Trade Credit Association

At the annual meeting of the Automobile Trade Credit Association, held at the offices of its secretary and attorney, Franz Neilson, 80 Wall street, New York, all of the old officers were re-elected, as follows:

President, W. B. Lasher, Weed Chain Tire Grip Co.; vice-president, Carl Kaufman; treasurer, M. J. Martin, George Haws Co.; secretary, Franz Neilson. These gentlemen, with E. S. Fretz, Light Mfg. & Foundry Co.; George L. Holmes, Jones Speedometer Co.; F. S. Wilson, Trenton Rubber Mfg. Co., and H. B. Mirick, National Electric Supply Co., constitute the board of directors.

During last year it was reported that the association had been able to collect 75 per cent. of the old and doubtful accounts of its members. The total number of accounts handled was 863, of which 805 were collected, the total amount being $75,341, of which $56,801 was collected.

Among the new members recently enrolled are: Anderson & Wilkens, Firestone Tire & Rubber Co., Universal Elec. Storage Battery Co., Chicago Battery Co., Nathan Novelty Mfg. Co., Western Electric Co., The Wm. Cramp & Sons Ship & Engine Bldg. Co., Dow Tire Co., Rajah Auto Supply Co., Stevens-Duryea Co., Wheeler & Schebler.

1,200-Mile Reliability Run

The new contest committee of the Chicago Motor Club has planned the longest reliability run ever proposed 1,200 miles for June 24, 25, 26 and 27. Each car will be required to do 300 miles a day, the "hub and spoke" plan being adopted so the cars will finish in Chicago each day. The season for 1908 will be opened in May instead of two months later. A novelty discussed, was a three or four day reliability test of high-wheel buggy autos.

1908 Grand Prix Regulations

The 1908 Grand Prix race is scheduled to take place sometime during the first two weeks in July. The distance will be between 440 and 500 miles. The entrance fee for one car is 5,000 francs, two cars 9,000 francs, and three cars 12,000 francs. Entries at ordinary fees close at 6 P. M. on Feb. 15, and at double fees at 6 P. M. on June 1. The Ostend Conference Rules will be used. The cylinders maximum bore must be 155 millimeters for four cylinders, and the minimum weight, without passengers, gasoline, water or spare parts, 1,100 kilogrammes.

Rules and Regulations of the Prince Henry Endurance Contest

Complete rules and conditions for the Prince Henry endurance contest have been submitted by the joint technical committee of the Imperial A. C. and the German Automobile Mfgrs. Asso., to Prince Henry for his approval. An average of 200 miles will be run per day, with a total of 1514 miles for the 7 days. The competition is limited to four and six cylinder cars, with cylinder bores of 3.4 to 5.8 inches or motors of 16 to 70 H. P.

According to the official definition of the American Automobile Association, a "national race is a race where the entrants are respectively named by and represent any two or more of the automobile clubs affiliated with the American Automobile Association," while an "international race is a race where the entrants are respectively named by and represent any two or more of the recognized national affiliated automobile clubs of the world."

N. A. A. M. has fixt on February 6-13, 1909, as the dates for the next Chicago show, which will be held in the Coliseum and First Regiment Armory.

A National Automobile Show Desired

In our January issue an editorial "The Demoralizing Effect of the Shows" was published, in which some of the disadvantages of the present system of automobile shows, were set forth. In the February issue a very few of the large number of letters in answer to this editorial were published. Anyone could not read these letters which are from representative firms of the automobile and parts manufacturers without being struck by the unanimity of opinion in regard to the necessity for a radical change in the automobile show situation. Considerable diversity of opinion was expressed as to the best method of dealing with the Show situation, but practically all agreed that the time had come for a change of some kind, as the industry has unquestionably passed the "educational" period, as one automobile maker put it, and the results are not in proportion to the enormous expenditures entailed.

Many suggestions were offered varying from an open-air carnival to two stupendous national shows to be held in probably New York and Chicago. Some advocated a type of nomad show which should be held each year in a different locality, and point out the advantages to be gained by making possible a large attendance of those living in different parts of the country who might not be able to attend a show held at either extreme of the continent. They also argue that other advantages would be gained, as such a method would stimulate a friendly rivalry between the different cities which might be candidates for the event. But in every case the general idea prevailed that there should be but one or two shows each year, and that these be truly representative and national in character in which licensed and unlicensed should participate alike and on an equal footing.

The combination of an outdoor meet, in connection with an automobile indoor exhibition seems to have many advocates, and of course necessitates the holding of the show at some other than the midwinter period. At such a convention, as it might well be, all of the manufacturers and agents could meet each other and friendly contests be engaged in before an appreciative public, and in this way the features of the different cars could be brought out in a practical way that is impossible with simply an indoor show.

The usefulness of the automobile shows as now held as a means of placing agencies is also questioned by many of the makers, who claim that conditions are such at these exhibits that it is very nearly impossible to do business with those who have not really previously made up their minds very definitely as to the type and price car or cars which they wish to handle, and outside of this feature, the only other strong talking point for the shows as now held is the opportunity which is given the purchasing public to investigate details of construction and compare one make with another. Nearly all agree that there has been much unnecessary expense connected with the shows which might very well have been placed in improving the cars themselves, and the fact is also pointed out that this expense in the long run must be paid by the car purchasers without receiving in return this money value in improved constructions. Some even go so far as to claim, and justly claim, that the present system of shows "restrict the engineering development of automobiles to given calendar dates instead of encouraging the making of improvements wherever required by circumstances and experiences," and thus interfere with the most rapid development. Some who might be called extremists have already cut out the shows and claim that the money can be spent in other ways which bring them much larger returns. However, for new concerns or those placing on the market new devices, it is generally conceded that the publicity obtained by exhibiting at an annual automobile show is extremely profitable.

This discussion does not, of course, take into account the development of the commercial vehicle which is an entirely sep-

Hosted by Google

arate matter and must be dealt with individually.

In conclusion it may be said that with few exceptions the consensus of opinion seems to be that a change should be made tending toward a single, or at most, two national shows each year, in which all American cars, parts and cycles, can have representation, and it is hoped that the matter may not be dropped before some satisfactory arrangement is determined upon.

Commercial Vehicle Abuses

The use of commercial vehicles is now increasing rapidly and the fearless companies who did the pioneering are to-day recognized in their communities as the most progressive business concerns. Although this pioneering doubtless cost heavily, a large part of the expense was charged to advertising and the advertising evidently paid.

There are now many commercial vehicles of moderate capacity and not a few large trucks which have been thoroughly tried out in many lines of business and are known to be satisfactory. Yet the service obtained by different users of the same make of vehicle differs so widely that one is forced to attribute the variations to other causes than poor materials or design of the machines. Investigation shows that by far the largest part of the trouble encountered is due to abuse and the inexperience or carelessness of the operators.

It is probably safe to say that 90 per cent. of the commercial vehicles now in use are daily overloaded and called upon to do by far more than their designers ever intended them to do. There seems but one way to prevent this very prevalent cause of a multitude of commercial car ailments, and that is, to so limit the size of the carrying platform that it is unprofitable with ordinary goods to overload the machines. Tires are usually the first to suffer from overloading and then follow in succession nearly every form of trouble that can befall a self-propelled vehicle. Of course, the tire and truck makers are blamed if the machine fails at a critical moment after several months of such abuse.

Inexperienced and careless operators are another sure cause of disaster regardless of the make of vehicle used. Unfortunately short-sighted views on economy have led many otherwise good business men to employ very cheap but in reality very expensive drivers. This is certainly a mistake at this stage of development, not of the truck but of the truck driver. The time will come when more of our boys have grown up in the company of motor-driven trucks and good competent drivers can be had at low figures, but this state is far from being realized at present. However, the higher grade chauffeur's clubs and schools are now paving the way to this end.

A very common cause of dissatisfaction when inexperienced help is employed is the result of neglecting minor details which should have had immediate attention before they grew into serious troubles. Small protecting shield and dust cap screws are lost, the caps come off and the parts are left to run exposed, motors are sometimes allowed to run dry, because of some slight stoppage which could have been easily removed if attended to at once. Loose parts are not promptly adjusted, etc., but perhaps the greatest evil and one of the hardest with which to deal, is often done by experienced drivers, many of them direct from the factory of the makers of the truck. We refer to fast driving, to which unquestionably much trouble can be traced. Very often a factory operator is sent to instruct a purchaser in the use of a truck and perhaps attempt to convert in a few days one of the horse drivers into a chauffeur. Usually the factory man is a tester, and as most of his driving has been at top speed in an apparent endeavor to see how much damage can be done to the truck before it is turned over to some luckless purchaser, he naturally demonstrates in the same way. The maximum load is put on and a flying trip out and return is made at a speed that would absolutely ruin the truck in less than six months. The purchaser is delighted with the amount of goods delivered in such a short time, and, of course, the converted horse driver emulates the example of his expert instructor and also drives at top speed as long as the engine runs and the machine holds together. There can be but one result,—disaster, and who is to blame; surely not the owner, for he knows no better, not the truck, for it may really be well constructed. The truck manufacturers are the guilty parties, for they surely ought to know better.

There are two methods of correcting this evil. One lies with the purchaser if he is sufficiently informed to use it and consists simply of placing a locked recording speed device upon each machine and discharging the driver if definite speed limits are exceeded. The other lies with the maker, who can gear down the truck so that its speed cannot be excessive, but even in this case, trouble is likely to follow, as the drivers will continually race the engine in a vain attempt to go faster.

Although the present commercial vehicles are not perfect, yet what is now needed is not so much improvement in the trucks themselves as in the methods of their handling, and we look forward to the time when truck makers will see the folly of demonstrating how very rapidly their trucks can deliver goods and will also see the wisdom of equipping their machines with some form of speed recording device.

Careless Use of Form Letters

Lax methods of conducting business are always more or less fatal in any line of endeavor, and are none the less so in the automobile and motor cycle industry. It would appear from the letters sent out by some firms and purporting to be answers to inquiries from possible purchasers that lax business methods are rather increasing than decreasing among both manufacturers and dealers. We have particular reference to the abuse of stock forms and letters which are, when rightly used, one of the best modern methods of reducing the excessive labor in connection with correspondence.

No recent innovation in office methods has reduced the labor of correspondence more than stock letters and forms and methods of reproducing these in quantities, and their proper employment ought to increase rather than decrease the sales of any properly conducted company. Nevertheless, there is a growing tendency apparent, to abuse the use of such forms in order to avoid legitimate letter-writing. For example, it is very common for an inquirer to ask for definite specific information in regard to certain manufactured products, prices, etc. Such a letter cannot be satisfactorily answered by carelessly mailing to the probable purchaser a couple of circulars and a form letter which may or may not remotely hit the case. This method of doing business can usually be traced to the careless reading of mail and the fact that it is so very easy to turn the matter over to some of the stenographers with a note to send circulars and letter A, B, C or D, instead of giving personal attention to the matter and answering definitely the particular inquiries made. The receipt of such a letter by an inquirer usually disgusts him to such a point that his business will be transacted with some other firm who do pay closer attention to the details of their correspondence, or if the particular firm in question is practically the only one from whom the said goods can be purchased, it necessitates further correspondence on the matter. In many cases even a second letter receives the same general superficial treatment as the first and it needs must be a persistent purchaser who will follow up the matter with a third letter in order to obtain the necessary information before purchasing.

The legitimate use of circulars, stock forms and letters is a decided advantage, and it seems a pity that in so many cases it is found so easy to fall back on this simple method of disposing of a mass of communications rather than giving them the earnest, personal attention which they should receive, if prospective purchasers are to become permanent patrons.

A warning is given at this time as the use of such forms is now very general, and we feel that the incorrect use of them so rapidly leads to disadvantageous results that the attention of employees should be particularly called to the correct and incorrect methods of using such form letters.

New York-Paris Race in Progress

On Wednesday, February 12, the participants in the New York to Paris race started from in front of the Times Building, at 42d and Broadway, New York City, each carrying an American flag presented by President Hoyt, of the A. C. A. the night before at a farewell banquet given by the club in honor of the contestants. Jefferson De Mont Thompson, chairman of the A. A. A. Racing Board, announced that he would give $1000 in gold to the first driver presenting his flag to the president of the Automobile Club of France.

Three French, one Italian, one German and one Americen car (a Thomas) made the start, and up to this writing are making fair progress across the continent. Besides these official starters, Eugene Le Louvier, with a Werner car, is covering a different route, bound for the same goal. He is the originator of the proposition to run a New York to Paris race, but altho **Le Matin**, a French newspaper, pushed the project, the route Le Louvier suggested was not adopted. Hence, he has started on his own hook to cover his own route unofficially. He left New York City Tuesday, February 11, and will go by way of Philadelphia, Cincinnati, Kansas City, St. Louis, Cheyenne, Portland and Tacoma, while the official racers are taking the northern route by way of Albany, Rochester, Buffalo, Cleveland, Toledo and Chicago.

Harry E. Fields, of the Hartford Works Company, has been advanced from sales manager to vice-president, and will hereafter make his headquarters in New York City.

The Brennan Motor and Manufacturing Co., of Syracuse, N. Y., has purchased the Phoenix Machine Co's. plant and will use the same as an addition to its regular plant for the manufacture of gasoline engines and automobile parts.

At the annual meeting of stockholders of The Pittsburgh Automatic Vise & Tool Co., held in the general offices of the Company in Pittsburgh, Pa., Monday Jan. 13, '08, the old Board of Directors were all re-elected for the ensueing year. At the annual directors meeting following, the old management was unanimously re-elected with the following appointments: G. P. Blackiston, Pres. and Gen. Mgr., A. H. Blackiston, Vice-Pres., and H. T. Kehew, Sec'y. and Treas.

A. A. A. to Test Tire Chain Ordinance

Any member of the American Automobile Association arrested for alleged violation of the recently re-enacted ordinance by the Park Board, of the City of New York, prohibiting automobiles wearing tire chains, from entering the parks, upon due notification to the office of the Association, 437 Fifth Avenue, or to Charles Thaddeus Terry, Counsel for the A. A. A., by person so arrested, the Association will be willing to defend the person or persons so arrested without expense to him or them, in such a number of cases as may be adequate to test the validity and frugality of the ordinance.

Sixth Annual Boston Automobile Show

On March 7, the sixth annual Boston Automobile Show, in Mechanics Building, will open its doors to the public. The exhibits will be on view until Saturday evening, March 14. Special exhibits of Motorcycles and Commercial Vehicles are features. Signs and decorations will be uniform and artistic. From the already large list of exhibitors the show, which is as usual under the able guidance of Chester I. Campbell, promises to surpass any of the previous Boston exhibits.

A. M. C. M. A. Detroit Meeting

Following the most prosperous year in its history, the American Motor Car Manufacturers' Association at its recent annual meeting in Detroit, re-elected the full Committee of Management, which comprises Benjamin Briscoe, Chairman; R. E. Olds, Vice-Chairman; H. O. Smith, Treasurer; Wm. Mitchell Lewis, Secretary; and W. H. Van Dervoort, Auditor. It was decided to distribute a 25 per cent. rebate to all the members who exhibited at the Grand Central Palace Show. The financial report indicated that the Association was in the best financial condition of its history. It was voted to turn over $5,000 to the Good Roads Committee, to be expended during the current year at its discretion.

There was a long discussion regarding automobile shows at New York and Chicago, and after making certain recommendations, the show matter was placed in the hands of the Show Committee.

George N. Pierce, who has not been taking an active part in the business of the George N. Pierce Co., of Buffalo, N. Y., has formally retired from the concern, and G. K. Birge has been elected president in his stead. Other officers are Henry May, vice-president; Charles Clifton, treasurer; L. H. Gardner, secretary. The board of directors includes the above officers and W. H. Hoyt.

Transportation Department for N. A. A. M.

At a recent meeting of the National Association of Automobile Manufacturers, the Executive Committee decided to organize a transportation department. Mr. J. S. Marvin, who has been in charge of the traffic department of the A. L. A. M., will be asked to head the department, and it is expected that work will begin at once.

Eighteen Briarcliffe Race Entries

Eighteen entries are now in hand for the Briarcliff Trophy race, scheduled to take place on the West Chester course on April 24th. The entries include 1 Austrian, 2 French, 5 Italian, and 10 American cars.

Marcus L. Brock has resigned as associate manager of the A. L. A. M. and his work is to be taken up by other members of the staff.

Joseph Bennett, formerly in charge of the Philadelphia Fisk Rubber Co's Branch recently joined the sales department of the Babcock Electric Carriage Company.

Orrin S. Werntz, Treasurer of the National Acme Manufacturing Company, since its organization, died February 6th, 1908, age 32. He was born in Canal, Fulton, Ohio.

The Badger Brass Manufacturing Co. has practically abandoned the Kenosha, Wis., plant so far as the manufacture of Solar automobile lamps is concerned. Officials of the company have formally announced that this end of the business has been transferred to New York City, and all parts that were made at Kenosha have been sent to the branch in that city.

Additional machinery has been installed in the factory of the Detroit Seamless Steel Tubes Co., of Detroit, Mich., which enables the company to produce larger sizes of "Detroit" cold drawn seamless tubing, and also permits a much larger output of regular sizes. The demand for "Detroit" tubing has grown to such large proportions that the addition to the company's manufacturing facilities was urgently needed.

The Appellate division of the New York Supreme Court has affirmed the ruling of Judge O'Gorman in the lower court in the case of the Searchmont Automobile Company against the A. L. A. M. The action was brought to compel a division of the profits of the A. L. A. M. on the ground that it is a partnership. The decision is to the effect that the Searchmont Company had forfeited its license by failing to pay its royalties and that the A. L. A. M. had a right to cancel the license.

The Fuller Model A 6-Cylinder, 60 H. P. Tour Car; price, $3500; wheel base, 118 inches; weig about 2350 lbs.; all other specifications same as Model A.

Fuller Gentleman's Roadster; price, $2500; se 3; all other specifications same as for Model A.

Fuller Model C Runabout; seats 2; price, $1500; cylinder, vertical, water-cooled, 4-cycle, 4-inch b and stroke, 22-26 H. P. motor, under hood, on s frame; mechanically operated valves; Parson's wh brass crank and cam shaft bearings; jump spark nition, by dry cells, regular equipment, storage b tery, dynamo or magneto optional; force feed lub cation; multiple disc clutch; planetary, 2-speed f ward and reverse, direct on high, change speed ge operated by side lever, mounted on ball Hyatt a roller bearings; tires, 30x3 inches; Timken rol wheel bearings; 96-inch wheel base; prest steel fran main and sub-frame; half-elliptic springs front a full elliptic rear, 40x1¾ inches, 5 leaves; ball-beari worm and sector steering gear; throttle and sps control on top of wheel; internal expanding brak on rear hubs and reverse speed used as brake; se 2; weight, 1300 lbs.; 15-gallon gasoline tank, un front seat; equipment, searchlight, side oil ligh tail light, horn and tools. This model, with tour car body, lists at $1800.

Duryea Gasoline Vehicles.

Made by Charles E. Duryea, Reading, Pa.

DURYEA FOLDING REAR PHAETON. $1500.

Duryea folding rear phaeton, furnished with fo ing rear seat; price $1500; 3-cylinder, 4-cycle, inclin water cooled, 15 H. P. motor under seat, suspended body; cylinders, 4½-inch bore and stroke; automa inlet valves both in front and on upper side; wh brass crank shaft bearings and bronze cam sh bearings; make-and-break ignition by dry cells a magneto; Duryea pressure feed oiler and splash s tem of lubrication; bronze to iron double cone clut planetary change speed gear, 2 speeds forward a reverse, direct on high, operated by steering han and runs in oilless metaline bearings; chain dri 1 piece round axle in rear, tubular front axle; tir 30 by 3-inch in front, and 36 by 3½-inch in re ball bearings in front wheels, and plain bearings rear wheels; wheel base, 80-inch; armored wo frame; springs ¼ elliptic, 27 by 1½-inch, 5 leaves, front, and half elliptic, 45 by 1¾-inch, 5 leaves, rear; single vertical lever steering gear; one br in rear sprocket; control details: a single verti lever at center of seat steers, throttles and s clutches; capacity, four adults and two children; g oline capacity, 8 gallons, tank under front flo weight, 1175 lbs.; equipment: 2 oil lamps; spec features; one lever control. This chassis is also

al, offset, water-cooled, 4-cycle, 5½x5½, 90 H. P. tor, in front, under hood, attached direct to side frame; mechanical valves, inlet directly over exust; 7 Parson's white brass crank shaft bearings; rson's white brass cam shaft bearings; two separ- ignition systems, dry cells and magneto; mechan- l lubrication; multiple disc clutch; selective, slid- change speed gear, on annular ball-bearings, 4 eds forward, 1 reverse, direct on high speed, op- ted by side levers; shaft drive; floating type rear e; I-beam front axle; 36-inch wheels, on Timken rings; 4½-inch tires; 134-inch wheel base; prest

STIN XC-R COMBINATION ROADSTER. $6000.

el frame; semi-elliptic springs front, 38 inches g, 2 inches wide, 8 leaves; three-quarters-elliptic ings rear, 49 inches long, 2 inches wide, 9 leaves; ering gear, worm and nut, rack and segment; two kes, one internal expanding and one external con- cting; side lever control; passenger capacity as ring car, 5; as runabout, 3; weight, 3600 lbs.; gallon gasoline tank, under seat; equipment, fold- glass front, 2 gas lamps and generator, 3 oil ps, extra spark plugs, single top and double top; pump, repair kit and full set of tools; price, 00. Special features: combination runabout and ring car body.

AUSTIN XC-T TOURING CAR. $6000.

ustin XC-T Touring Car; same power equipment l general specifications as Model XC-R combination dster; 7 passengers; weight, 3800 lbs.; fitted with l extension top; price, $6000.

STIN XC-L DETACHABLE TOP LIMOUSINE. $7000.

ustin XC-L Limousine has the same chassis as Model XC-T touring car, but is fitted with de- hable top limousine; weight, 3800 lbs.; price, 00.

inches long, 2 inches wide, 8 leaves; three-qua elliptic rear, 49 inches long, 2 inches wide, 9 lea steering gear, worm and nut, rack and segment; brakes, one internal expanding and one external tracting; side lever control; passenger capacity, touring car, 5; as roadster, 3; weight, 3400 gasoline tank under seat, holding 16 gallons; eq ment, folding glass front, 2 gas lamps and genera 3 oil lamps, single top and double top, extra s plugs, air pump, repair kit and full set of to price, $4500. Special feature: combination tou and **runabout body.**

AUSTIN MODEL LX-T TOURING CAR. $45

Austin Model LX-T Touring Car; same chassi Model LX-R roadster; 7 passengers, weight, lbs.; full extension top; price, $4500.

AUSTIN MODEL LX-L DETACHABLE TOP LIM SINE. $5500.

Austin Model LX-L Limousine; same car as M LX-T touring car, fitted with detachable top li sine; weight, 3800 lbs.; price, $5500.

Diamond T Motor Cars.

Made by the Diamond T Motor Car Co., Chicago,

DIAMOND T ROADSTER. $3500.

Diamond T roadster, $3500; 2 or 4 passengers cylinder, 4-cycle, vertical, water-cooled, 5-inch and stroke, 50 H. P. motor, located in front on frame; mechanically operated valves, all on side; die cast white metal crank shaft beari bronze cam shaft bearings; double ignition sy by storage battery and magneto; automatic lub tion; cone clutch; 3 forward speed sliding ch gear, mounted on Timken roller bearings; shaft d to live rear axle and 1⅝-inch I-beam forged axle; 36 by 3½-inch front and 36 by 4-inch

AMERICAN TOURIST 40, $3250.

merican Tourist 40; wood body; 4-cylinder, ver-al, water-cooled, 4-cycle, 5x5, 40-50 H. P. motor, ated forward, under hood, on main frame; babbitt nk shaft bearings, bronze cam shaft bearings; ig-ion by Bosch magneto, coil and storage battery; chanical force feed lubrication; fan blade cone tch; sliding, 3-speed, change gear, direct on high eed, on annular ball-bearings, operated by lever side; shaft drive; floating type rear axle; I-section nt axle; 36-inch wheels, on ball bearings; 4-inch es; 116-inch wheel base; steel frame, dropt; half-iptic front springs, 42 inches long, 2 inches wide, leaves; platform springs rear; screw and nut type ering gear; foot brake rear of transmission; hand ake, expanding within drum, on wheels; spark and rottle control levers on stationary quadrant on eel; passenger capacity, 5; weight, 2600 lbs.; 18-llon gasoline tank, under seat; equipment, 2 gas, 3 lamps, generator and complete tool kit; price, 250. Special features: three-point spring suspen-n, simple control.

AMERICAN ROADSTER 40, $3250.

The American Roadster has the same power, equip-ent and general specifications as the Tourist 40, t the motor is placed on a raised auxiliary frame; echanical valves on one side; crank shaft bearings, ckel babbitt; frame prest steel; springs, semi-ellip-e front and rear; 42 inches long, 1¾ inches wide, leaves, front; 48 inches long, 1¾ inches wide, aves, rear; 3½-inch tires front, 4-inch rear; 2 passen-rs; weight, 2300 lbs.; 22-gallon gasoline tank, at ar of frame; equipment, 2 gas, 1 oil lamp, genera-r and complete set of tools. Special feature: Un-rslung frame.

on ball-bearings; 4-inch tires front, 5-inch rear; inch wheel base; dropt steel frame; half-ell springs front, 40 inches long, 2 inches wide leaves; platform springs rear; thread and nut steering gear; double internal expanding brakes, by side, and applying within drum on wheel; sp and throttle control levers on stationary quad in wheel; passenger capacity, 7; weight, 2800 19-gallon gasoline tank, under front seat; equipm 5 lamps and full equipment of tools; price, $4 Special features: simple control and spring sus sion.

AMERICAN ROADSTER 50, $3750.

The American Roadster 50 has the same po equipment and general specifications as Amer Tourist 50; engine is placed on raised auxi frame; wheel base, 110 inches; prest steel fra 3½-inch tires front, 4-inch rear; half-elliptic spr front and rear; 40 inches long, 1¾ inches wid leaves, front; 48 inches long, 2 inches wide leaves, rear; 2 passengers; weight, 2500 lbs.; gallon gasoline tank; equipment, 2 gas lamps generator, oil tail light and complete kit of t price, $3750. Special feature: underslung frame.

American cars described in our February, 1 issue, page 77.

Royal Gasoline Cars.

Made by the Royal Motor Car Co., Cleveland, O

ROYAL TOURING CAR, $4000.

Royal Tourist Touring Car; seats 7; price, $4 straight line body; 4-cylinder, 4-cycle, vertical, w cooled, 5⅛-inch bore, 5½-inch stroke, 45 H. P. m located under hood, on sub-frame, and mechanic operated valves on opposite sides of cylinders; n babbitt crank and cam shaft bearings; jump spar nition, by storage battery and high tension mag force feed oiler and splash lubrication; cone lea face clutch; 4-speed progressive chain speed direct on high, operated by hand lever and mounte Hess-Bright ball bearings; shaft drive to bevel floating type axle and tubular front axle; 36x4½

Digitized by Google

P., vertical, water cooled motor under hood, on r-point suspension; cylinders, 4-inch bore, 4½-inch oke; mechanical inlet valves; crank and cam shaft rings of Parsons white metal; jump spark ignition storage batteries and dry cells; force feed lubrica- n; cone leather faced clutch; progressive sliding nge speed gear, three speeds forward and one re- se; direct on high, operated by side lever, runs in nze bearings; bevel gear shaft drive; floating rear es and tubular front axle; tires, 32 by 3½; Timken er wheel bearings; 104-inch wheel base; prest steel

DRAGON TOURING CAR. $2100.

n and sub-frame; semi-elliptic springs, 44⅜ by 2-inch aves in front, full elliptic, 39¼ by 2-inch, 5 leaves, rear; worm and segment irreversible steering gear; brakes, two external contracting and two internal anding on rear wheels; sector spark and throttle trol on steering wheel; seats 5; 18-gallon gasoline k under front seat; weight, 1950 lbs.; equipment udes top, 2 gas lamps and generator, 2 side oil ps and tail oil lamp, full set of tools and tire re- kit; this chassis is also furnished as a town car landaulet body, same specifications at $2100. n car seats 2 in body and 2 in driver's seat.

DRAGON ROADSTER. $1850.

agon roadster, price $1850; 4-cylinder motor; 4½- bore and stroke; 35 H. P.; annular ball trans- sion bearings; I-beam front axles; 96-inch wheel ; ball wheel bearings; springs semi-elliptic front rear; 35¾ by 1¾-inch, 5 leaves, in front, and by 2-inch, 5 leaves, in rear; weight, 1900 lbs.; s 2; 20-gallon gasoline tank on rear of car; all r specifications are the same as for the Dragon 0 Touring Car.

Bay State 40 Gasoline Cars.

e by the Bay State Auto Co., 112 Norway St., Boston, Mass.

BAY STATE 40 TOURING CAR. $3750.

y State 40, 7-passenger, touring car; price, $3750; inder, 4-cycle, water-cooled, vertical, 4¾-inch by 5-inch stroke, 40 H. P. motor, set in front r hood on 3-point suspension; mechanically op- d valves; 3-crank shaft and 3-cam shaft bear- jump spark ignition by storage battery; 8 dry and magneto; mechanical lubrication; multiple clutch with cork insert; 4 forward speeds, direct rd, progressive sliding change speed gear, mounted all bearings; shaft drive; floating rear axle and m front axle; tires, 34 by 4-inch front and 34 by

Reo Gasoline Cars.

Made by the Reo Motor Car Co., Lansing, Mic

REO MODEL B RUNABOUT. $650.

Reo Model B single-seated runabout; single-cy der, horizontal, water-cooled, 4-cycle, 4¾x6, 8-10 P. engine under hood on 3-point suspension; mech cal valves; babbitt crank shaft bearings; br cam shaft bearings; jump spark ignition from cells; sight feed lubrication; multiple disc clu 3 speed and reverse change gear, direct on two spe operated by hand lever; reverse by foot lever; di single chain drive; tubular axles front rear; 28 in. wheels on Timken bearings; 3 in. ti 78 in. wheel base; angle iron frame; no sub-fra ¾ elliptic front springs; 34 ins. long, 1¾ ins. wid leaves, full elliptic springs rear, 33 ins. long, 1¾ wide, 3 upper and 3 lower leaves; irreversible w and segment steering by wheel; 2 double ac brakes on hubs; passenger capacity 2, on emerge 4; weight, 1275 lbs.; 6 gal. gasoline tank under h price, $650, including side oil and tail lamps, h and full tool outfit.

REO MODEL A TOURING CAR. $1250.

Reo Model A, 5-passenger touring car; 2-cylin horizontal, water-cooled, 4-cycle, 4¾x6 in., 18-20 P. engine under body on 3-point suspension; mecha cal valves; metal babbitt crank shaft bearin bronze cam shaft bearings; jump spark ignition dry cells; automatic lubrication; multiple disc clut 3 speed and reverse change gear, direct on two spee operated by hand lever, reverse by foot lever; dir single chain drive; tubular rear axle; tubular fr axle wheels on Timken roller bearings; 32x3½ tires; wheel base, 94 ins.; prest steel frame; pr steel sub-frame; half elliptic springs front, 39½ i long, 2 ins. wide, 5 leaves, full elliptic springs re 36 ins. long, 2 ins. wide, 5 upper and 5 lo leaves; irreversible worm and segment steering wheel; three double acting sprocket and hub brak spark and throttle control on steering post; also f accelerator; 5 passengers; weight, 1900 lbs.; 12 g gasoline tank under hood; equipment, 2 gas, 2 s oil and tail lamps, triple turn horn and full tool o fit; price, $1250.

Digitized by Google

body and load desired; side post steering gear frame with cross lever; brake from grooved shoes ring on large roller rings; control details: pedal ke, one pedal to shift rollers, side lever to engage ers, cross lever to steer, twist handle to throttle lift button on post for spark; seats 2 or 4; 6-gallon oline tank under seat; weight, 800 to 900 lbs.

Hol-Tan Gasoline Cars.

Iade by the Hol-Tan Co., 244-250 West 49th St., Y. City.

THE HOL-TAN STANDARD, $3000.

he Hol-Tan Standard touring car; 4-cylinder, verti , water-cooled, 4-cycle, 4½x4½, 25 H. P. engine front on 4-point suspension on sub-frame; valve ion by single rocker arm actuated by single cam top cylinder; special white bronze crank shaft rings; cam shaft bearings same; ignition by high sion Bosch magneto; force feed lubrication; mul- le disc clutch; selective sliding gear transmission special white bronze bearings, 4 speeds, direct on rth speed, operated by single lever; shaft drive; oer's full floating type rear axle; front axle, solid p forging; 34 in. wheels on adjustable ball bear- s, 3½ ins. front, 4½ rear; wheel base, 110 ins.; st cold rolled steel frame; sub-frame same; half ptic springs front, 36 ins. long, 1¾ ins. wide, 6 ves, full elliptic rear, 39 ins. long, 2 ins. wide, 6 ves above and below; double nut and screw type ering gear; external and internal brakes on rear eels, operated by foot pedal and lever; throttle trol by foot pedal and lever on top of steering eel for operation of ignition; 5 passengers; 16 gal. oline tank under front seat; price $3000, includ- full set of lamps, horn and generator.

THE HOL-TAN ROADSTER, $3000.

'he Hol-Tan Roadster, same chassis as The Hol- n Standard; 2 or 4 passengers; price $3000. With ne specifications as The Hol-Tan Special, $3750.

SNYDER NO. 5 MOTOR-BUGGY.

Snyder No. 5 Motor-Buggy; piano box body; do opposed, horizontal, air-cooled, 4-cycle, 4x4, 10-12 P. motor, under seat, on four-point suspension; va in cages at sides of cylinder; bronze crank and shaft bearings; jump spark ignition, dry cells; s feed compression lubrication; planetary change s gear, 2 speeds forward and one reverse, direct high, operated by pedals and lever; chain drive; s front and rear axles; 1⅛-inch solid rubber tires; elliptic springs front and rear; wheel or tiller st ing; 2 brakes on rear wheels; 5-gallon gasoline-t under seat; weight, 800 lbs.; fitted also with su and delivery wagon bodies.

Eureka Air-Cooled Gasoline Cars.

Made by Eureka Motor Buggy Co., Taylor Ave. Morgan St., St. Louis, Mo.

EUREKA 1908 RUNABOUT, $650.

Eureka Model 1908 runabout; price, $650; 2-c der, horizontal, air-cooled, 4-cycle, 4-in. bore stroke, 10-12 H. P. motor located in center of fr on hot riveted sub-frame; mechanically operated va on top; Parson's white bronze crank and cam s bearings; jump spark ignition by 6 dry cells; com sion oiler; 2 speed forward and reverse, direct high, planetary change speed gear, operated by l and mounted on bronze bearings; double chain dr dead rear axle and tubular front axle; 36x1⅛-in. in front and 40x1⅛ in rear; plain or Timken r wheel bearings; 64 to 80-in. wheel base; angle s main and sub-frame; special Concord side springs, ins. wide, 7 leaves; rack and pinion steering g external contracting brakes; spark and throttle trol on steering post; seats 2; weight, 1000 lbs. gal. gasoline tank under seat; equipment: full lea top, storm shield, fenders, lamps and horn; r with several interchangeable bodies.

Victor Gasoline Cars.

Made by the Victor Automobile Mfg. Co., 171 Ca St., St. Louis, Mo.

VICTOR MODEL A, HIGH-WHEEL CAR, $4

Victor Model A High-Wheeled buggy type car; p $450; 1-cylinder, 4x4, 2-cycle, water-cooled moto H. P.; forged steel crank shafts; jump spark

MARION MODEL 9 ROADSTER. $2750.

arion Model 9 Roadster; 6-cylinder, vertical, water-ed, 3¾-inch bore and stroke, 30-35 H. P. motor, forward, under hood, on side members of main ne; mechanically operated valves on right side motor; bronze babbitt-lined crank shaft bearings bronze cam shaft bearings; double ignition sys- by storage battery and magneto; force feed lu- ation; multiple disc clutch in fly wheel; sliding nge speed gear, 2 speeds forward and reverse, ct on high, operated by side lever and mounted Hess-Bright ball bearings; shaft drive; tubular t and rear axles; 34x3½-inch front and rear tires; wheel bearings; 104-inch wheel base; prest steel ne; semi-elliptic springs, 40 inches, in front, and scroll elliptic springs, 36 inches, in rear; worm nent irreversible steering gear; internal and ex- al brakes on rear wheels; spark and throttle con- in steering wheel; seats 2; 12½-gallon gasoline , under driver's seat; weight, 1900 lbs.; equip- t, 34x3½-inch tires, 2 gas lamps, 2 side oil and 1 tail lamp, tool kit, horn. Special features: dif- ntial and tranmission in one housing on rear axle.

MARION MODEL 8 ROADSTER. $2250.

rion Model 8 Roadster; 4-cylinder, vertical, water- ed, 4-cycle, 4-inch bore and stroke, 22-24 H. P. r, set forward, under hood, on side members of frame; mechanically operated valves, from two shafts on opposite sides of cylinder; die cast crank shaft and cam shaft bearings; 32x3½-inch front and rear; seats, 2, 3 and 4 persons; ht, 1850 lbs.; equipment; 2 gas lamps, 2 side amps, 1 tail lamp, tool kit, steamer trunks, single louble rumble seat and horn; price, $2250; all specifications same as for Model 9.
8 Marion cars described in our December, 1907. , page 124.

Klink Gasoline Cars.

e by the Klink Motor Car Mfg. Co., Dansville, N. Y.

steel main and sub-frame; semi-elliptic springs and rear, 36x2 inches, 6 leaves, in front, and inches, 7 leaves, in rear; screw and nut steering g 4 brakes on rear hubs; spark and throttle con on steering wheel and foot accelerator; seats weight, 2100 lbs.; 20-gallon gasoline tank, under f seat; weight, 2100 lbs.; equipment, gas and oil lam generator, horn, tools, pump and tire repair outfit.

KLINK ROADSTER. $2000.

Klink Roadster; price, $2000; same specifications for the touring car, with the exception of the se ing capacity, which is 4; the weight, 1900 lbs., an 15-gallon tank, under front seat.
1908 Klink models described October, 1907, p 142.

Adams-Farwell Air-Cooled Gasoline Ca

Made by The Adams Company, Dubuque, Iowa
Adams-Farwell Model 9 touring car; 5-cylinder, cycle, horizontal revolving; air-cooled, 5½x5, 50 H. motor under rear seat; valves in cylinder, heads chanically operated; 1 bronze crank shaft beari jump spark ignition, from storage battery; mechani force feed lubrication; cone clutch; selective slidi change speed gear, on H. B. bearings, 3 speeds ward; 1 reverse; direct on high, single chain dri live tubular rear axle; front axle, square steel, 36-i tires on Timken roller bearings, 4½-inch tires; wh

ADAMS-FARWELL MODEL 9 TOURING CAR. $35

base, 120 inches; trussed angle steel frame, se elliptic springs; 44 inches long, 2 inches wide, leaves front, 48 inches long, 2½ inches wide, 9 leav rear; Gemmer steering gear; internal expanding s external contracting brakes on rear hubs; control, v iable compression and spark advance; passenger pacity, 7; weight, 2700 pounds; 18 gallon gasol tank under body; equipment, 2 oil side lamps, 2 headlights, tail lamp, pump, jack, tools, etc. Pri $3500.
ADAMS-FARWELL MODEL NINE ROADSTER, $3
Adams-Farwell Model 9 roadster; same general ch sis specifications as Model 9 touring car; four p sengers; weight, 2200 pounds; price, $3000.

GROUT 1908 TOURING CAR. $2500.

rout 1908 touring car, price, $2500; 4-cylinder, 4-
e, vertical, water-cooled, 4½-inch bore by 5-inch
ke, 35 H. P. motor, set forward under hood on
frame; mechanically operated valves; hammered
bitt crank shaft bearings; white bronze cam shaft
rings; jump spark ignition by dry cells; force-
l lubrication; cone clutch; 3 speeds and reverse,
ct on high, selective sliding change gear, mounted

GROUT 1908 ROADSTER. $2400.

Timken roller bearings; double side chain drive;
ome steel (dead) rear axle and chrome nickel front
e; semi-elliptic front and rear springs, 39 by 2-
the rear; worm and sector steering gear; 2 brakes
each rear wheel; stationary control on top of
ering wheel; seats 5; 15-gallon gasoline tank under
nt seat; weight, 2450 lbs.; equipment: top, side
tains, head lights, side lights, generator. With
dster body, seating 4, price is $2400.

Lambert Gasoline Cars.

Made by the Buckeye Mfg. Co., Anderson, Ind.

LAMBERT FRICTION-DRIVE MODEL R. $2500.

Lambert friction drive Model R, 7-passenger touring

LAMBERT MODEL M SHAFT-DRIVEN CAR. $20

Lambert Model M, 5-passenger touring car; 4-cy
der Rutenber, 35-40 H. P. motor, friction drive
shaft to divided rear axle; all speeds forward
reverse; jump spark ignition; lubrication positive fo
feed; 32-inch wheels on Timken roller bearin
wheel base, 105 inches; internal expanding brakes
rear wheels; 20-gallon gasoline tank; full ellip
rear springs; semi-elliptic front springs; screw
nut steering; complete car weighs 1900 lbs.; equ
ment; cape extension top, 2 gas lamps with ge
ator, 2 oil lamps, tail lamp, horn, tool boxes
running board and full tool equipment; price $20

LAMBERT 5-PASSSENGER TOURING CAR MOD
S. $1275.

Lambert Model S, 5-passenger touring car; 2-
inder, horizontal, opposed, water-cooled, 24 H.
motor; 6-inch bore, 4½-inch stroke; friction cha
speed from 1 to 25 miles per hour; jump spark
nition; direct chain drive to each rear wheel; w
base, 94 inches; wheels, 30 inches on Timken ro
bearings, fitted with 3½-inch tires; 12-gallon gaso
tank; detachable tonneau; complete weight, 1800
foot rachet brake on differential, internal and
panding brakes in rear hub drums; equipment: 2
side lamps, horn and tools; price $1275.

LAMBERT MODEL 18. $800.

Lambert 3-passenger Model 18; motor, 2-cylinder,
posed, water-cooled, 18 H. P.; friction change s
gear; jump spark ignition; drive, single chain to
axle; wheel base, 95 inches, 30-inch wheels on H
roller bearings; 3-inch clincher tires; 10-gallon
oline tank; external brakes on rear wheel dr
complete weight, 1350 lbs.; equipment: 2 oil la
horn and full set of tools, $800.

Corbin Air-cooled Gasoline Cars.

Made by the Corbin Motor Vehicle Corporation,
Britain, Conn.

y cells, or Bosch high-tension magneto; lubrication, ght feed oiler and splash; leather-faced cone clutch; lective change speed gear, 3 forward speeds and 1 verse, direct on high, on F. & S. ball-bearings, oper-ed by side lever; shaft drive; semi-floating rear les; I-section drop-forged front axle; tires 34x3½ ches in front and 34x4 inches in rear; wheel bear-

RBIN MODEL S, 2, 3 OR 4-PASSENGER RUN-ABOUT, $2650.

s F. & S. ball thruout; wheel base, 108 inches; annel prest steel frame; springs semi-elliptic front d rear, 50x2¼ inches, 8 leaves, in front, and 40x2 hes, 6 leaves, in rear; worm and sector irreversi-steering gear; 4 enclosed internal expanding brakes rear wheels; gasoline capacity, 15 gallons, tank ated under seat; gravity feed; weight, 2300 lbs.; uipment, coal and foot rails, tail and 2 dash oil nps, 2 headlights and generator, horn, tool kit and re parts. Model R chassis is also furnished with 3 or 4-passenger runabout body; weight, 2150 lbs. ce, $2650.

RBIN MODEL O, 2, 3 OR 4-PASSENGER RUN-ABOUT $2500.

orbin Model K touring car; price, $2500 all other cifications are the same as for Model R Touring . Model K Touring Car is also furnished with a 3 or 4-passenger runabout body for the same price the touring car.

orbin, 1908, cars described in our January, 1908, ue, page 187.

Staver Gasoline Cars.

ade by the Staver Carriage Co., 76th and Wal-e Sts., Chicago, Ill.

STAVER MODEL D STANHOPE, $1000.

aver Model D Stanhope, 2-cylinder, horizontal, er-cooled, 2-cycle, 5x5, 18 to 20 H. P. engine r seat, suspended on sub-frame; valves at ends cylinders operated by push rods; Parson's white s crank shaft bearings; cam shaft bearings e; jump spark ignition by dry cells; six feed hanical oiler; multiple disc clutch; planetary

Bendix Gasoline Cars.

Made by the Bendix Company, Cragin Stat Chicago, Ill.

DUPLEX MODEL NO. 1, $650.

Duplex Model No. 1 Stanhope; 2-cylinder, 4-c 4⅛x4, 12 H. P. engine under hood on sub-fra mechanical valves; jump spark ignition from cells; force feed lubrication; no clutch; double tion change gear on Hyatt Roller bearings, number of speeds, operated by side lever; double chain drive; 1⅛-in. axles; wheels on Timken r bearings; 1⅛-in. Firestone solid side wire tires; elliptic springs, 1½ ins. wide, 3 leaves; lever s ing; internal expanding brakes; throttle and s control on steering column; passenger capacity, weight, complete, 800 lbs.; 6 gal. gasoline tank u seat; equipment, tools, lamps, horn, extra plug, can, etc.; price, $650. Special features: absolu gearless car, no differential, any speed, double tion drive.

BENDIX MODEL NO. 4, $1250.

Bendix Model No. 4 Gentleman's Roadster, beetle back deck; 4-cylinder, vertical, air-cooled cycle, 4x4, 20-24 H. P. engine under hood on frame; mechanical valves; brass crank shaft beari brass cam shaft bearings; jump spark ignition dry cells; force feed lubrication; no clutch; do friction change gear, on bronze bearings, operated side lever, any number of speeds; double side c drive, 1¼-in. axles; wheels on Timken roller b ings; 1½ in. tires; wheel base, 103 ins.; angle s frame and sub-frame; full elliptic springs, 36 long, 1½ ins. wide, 5 leaves; irreversible wheel st ing; internal expanding brakes; spark and thro control on steering column; passenger capacity, weight, 1500 lbs.; 12 gal. gasoline tank under s equipment, tools, lamps, horn, extra plug, oil etc. Price, $1250. Special features: double fric drive, any speed ratio, no differential.

BENDIX MODEL NO. 5, $1350.

Bendix Model No. 5 Surrey; same specifications Model No. 4 Roadster; passenger capacity, 5; wei 1600 lbs.; price, $1350.

Overland Gasoline Cars.

Made by the Overland Automobile Co., Indianap Ind.

OVERLAND MODEL 24 RUNABOUT, $1250.

Overland Runabout, Model 24; 4-cylinder, verti water-cooled, 4-cycle, 3½x4½, 20-22 H. P. mo located in front, under hood, on three-point sus sion; nickel babbitt crank shaft bearings and bro

CE-RACINE MODEL D TOURING CAR, $2500.

rce-Racine Model D straight line touring car; nder, vertical water-cooled, 4-cycle, 4½x5½, 40 P. engine in front suspended from 2 arms on side; valves on opposite sides of cylinders; nickel tt crank shaft bearings; bronze cam shaft bear- jump spark ignition by storage battery and dry force feed lubrication; leather faced cone clutch; g change speed gear on ball bearings, 3 speeds rd, direct on high, operated by side lever; gear drive; floating rear axle; tubular front 34 in. wheels on ball bearings; 4½ in. tires; l base, 106 ins.; frame, 149 ins.; sub-frame, s.; half elliptic springs, 44 ins. long front, 2 ins. 8 leaves, 50 ins. long rear, 2 ins. wide, 9 s; sliding nut steering gear; 2 pair brakes on wheels; passenger capacity, 5; weight complete, lbs.; 24 gal. gasoline tank under front seat; ment, 2 side lights, 1 tail light, 2 head lights generator; price, $2500.

CE-RACINE MODEL E TOURING CAR, $2000.

rce-Racine Model E straight line touring car; 5 ngers; 4-cylinder, vertical, water-cooled, 4-cycle, 30 H. P. engine, in front suspended from two on each side; valves on opposite sides of cylin- nickel babbitt crank shaft bearings; bronze cam bearings; jump spark ignition from storage ry and dry cells; force feed lubrication; leather cone clutch; 3 speed sliding change gear, on bearings, direct on high, operated by side lever; gear drive; tubular front axle; 32 in. wheels on bearings; 4 in tires; wheel base, 104 ins.; e 149 ins., sub-frame 72 ins.; half elliptic gs, 42 ins. long, 1¾ ins. wide, 7 leaves 48 ins. long, 1¾ ins. wide, 8 leaves Barnes steering gear; 2 pair brakes on wheels; weight, 2400 lbs.; 19 gal. gasoline under front seat; equipment, side lights; price, ; 1908 models described February, 1908, page

Columbia Gasoline Cars.

by the Electric Vehicle Co., Hartford, Conn.

tires; prest steel frame and sub-frame; semi-ellip springs front and rear, 2 inches wide; front, 5 leave and rear, 6 leaves; irreversible worm and sector stee ing gear; 2 emergency brakes, hand-operated; foo operated brake on rear hub drums; spark and throtl on steering wheels, also accelerator pedal; 17-gall gasoline tank, under front seat; passenger capacity, persons; equipment, 5 lamps, horn, tools, etc.; pric $3000.

COLUMBIA MARK 663 GASOLINE CAR, $6500 T $9000.

Columbia Mark 663, with touring, landaulette touring bodies; 4-cylinder, vertical, water-cooled, 5½ 5½ motor, 48 H. P. (A. L. A. M.), mounted on fo legs, under the bonnet; mechanically-operated valve one over the other, in off-set chambers; white bra crank shaft bearings; bronze cam shaft bearing high tension ignition from storage battery, with d tributer and Gianoli magneto; splash and mechanic lubrication; clutch, special electric generator; chan speed gear, electrically controlled, on Hess-Brig bearings, giving 5 speeds ahead and 3 reverse, dire on the high, operated by a single lever; shaft dri to live rear axle; front axle I-section; 124-inch whe base; 36-inch wheels, on Timken roller bearings; 4-in front and 5-inch rear tires; U-section prest ste frame, trussed; semi-elliptic springs front and rea irreversible worm and sector steering; 2 mechanic brakes, 1 electrical brake; control by spark a throttle on steering wheel, also foot accelerator; 2 gallon gasoline tank, under front seat; capacity, persons; equipment, oil, gas and tail lights, hor tools, self-starting device; price, from $6500 to $90 according to bodies. 1908 Columbia models describ in our November, 1907, issue, page 70.

Maryland Gasoline Cars.

Made by the Sinclair-Scott Co., of Baltimore, M

MARYLAND ROADSTER, PRICE, $2500.

Maryland roadster, with a seating capacity of 2, or 4 persons; 4-cylinder, vertical, water-cooled, 4 4, 36 H. P. motor, under the hood on cross m members; mechanically operated valves in cylin heads by overhead cam shaft; Parson's white br crank shaft bearings and bronze cam shaft bearin jump spark ignition from storage battery; force-f lubrication through sight feeds; leather-faced c clutch with cork inserts; 3-speed forward and 1 verse sliding change gear on Parson's white br bearings, direct on the high, and progressively op ated; shaft drive to semi-floating rear axle; I-sect drop forged front axle; 106-inch wheel base; 32-i wheels on Maryland conical rollers; 3½-inch ti prest steel frame; semi-elliptic front springs; f elliptic rear springs, 38 by 1¾, 7 leaves in the fro 6 in each half of the rear; Gemmer steering ge internal expanding and external contracting b brakes on the rear wheels; spark and throttle lev on steering wheel; 15-gallon gasoline tank under fr

TCHELL MODEL I TOURING CAR. $2000.

chell Model I, 5-passenger touring car; price
0; 4-cylinder, 4-cycle, vertical, water cooled,
ch bore by 5-inch stroke, 35 H. P. motor, set
ront under hood on sub-frame; mechanically op-
d valves; five babbitt bearings on crank shaft,
2 brass and 1 babbitt bearing on cam shaft;
spark ignition, by dry cells; mechanical oiler
hood; cone clutch; progressive type change speed
3 speeds forward and 1 reverse, direct on high,
ted by side lever, and mounted in babbitt bear-
shaft drive; I-beam front axle; tires 32 by 4
s; wheel bearings, Hyatt roller in rear and ball
ng in front; wheel base 112 inches; prest steel
and sub-frames; half elliptic springs front and
40-inch in front and 48-inch in rear; external
acting and internal expanding brakes on rear
ls; spark and throttle levers on steering post; 15-
n gasoline tank under front seat; weight 2500
equipment: headlight brackets, oil light brack-
nd tail light bracket. Complete set of tools.

TCHELL MODEL G RUNABOUT. $1250.

chell Model G, 3-passenger runabout, price $1250;
nder, 4-cycle, vertical, water-cooled, 4x4-inch, 20
power motor, set in front under hood on sub-
e; mechanically operated valves; 5 babbitt crank
bearings; 2 brass and 1 babbitt cam shaft bear-
jump spark ignition by dry cells; mechanical
under hood; cone clutch; progressive speed change
3 speeds forward and 1 reverse, direct on high,
ted by side hand lever, and mounted in babbitt
ngs; bevel gear shaft drive; I-beam front axle;
32 by 3½-inch; ball wheel bearings in front, Hy-
oller bearings in rear; 92-inch wheel base; prest
main and sub-frames; half elliptic springs front
rear, 40-inch in front, 44-inch in rear; internal
nding and external contracting brakes on rear
s, operated by hand lever and foot lever; spark
hrottle levers on steering post; 16-gallon gasoline
under front seat; weight 1650 lbs.; equipment,
table headlight brackets, oil light brackets and
ight brackets, complete set of tools.

CHELL MODEL H RUNABOUT. $1000.

chell Model H, 2-passenger runabout, price $1000;
3½-inch tires front and rear; all other specifi-
s same as for Model G runabout. 1908 models
bed in our November, 1907, issue, page 108.

ear, 3 speeds forward and 1 reverse, mounted on
H.-B. ball-bearings, direct on high; shaft drive to
emi-floating rear axle; front axle I-section; 106-inch
heel base; 34-inch wheels, on Timken roller bearings;
ront tires 3½, rear 4; semi-elliptic springs front and
ear; front, 36x2¼ inches, and rear, 52x2¼ inches;
teering gear, worm and nut, on phosphor bronze
earings; external foot brakes on rear hubs, internal
and brakes on rear hubs; 15-gallon gasoline tank,
nder the seat, with 2 gallons reserve; equipment,
ull tool kit, mats and tire repair outfit; price, $2750.
pecial feature: double rumble seat.

LDSMOBILE MODEL M TOURING CAR. $2750.

Oldsmobile Model M 5-passenger touring car; 4-cylin-
er, vertical, water-cooled motor, 4¾x4¾, 36 H. P.,
. L. A. M. rating, mounted under the hood; valves
n one side, mechanically operated; crank shaft bear-
ng white bronze; cam shaft bearings bronze; jump
park ignition from storage and dry cells, magneto
xtra; splash lubrication; leather-faced cone clutch,
ith cork inserts; 3 speed and reverse selective slid-
ng change speed gear, on H.-B. ball-bearings, direct
n the high; shaft drive to semi-floating rear axle;
-section front axle; 112-inch wheel base; 34-inch
heels, on Timken roller bearings; 3½-inch front and
-inch rear tires; semi-elliptic springs front, 36x2¼
nches; rear, full elliptic, 38x2¼ inches; worm and
ut steering; external contracting foot brake on rear
ubs; internal expanding rear hub brakes, hand-
perated; passenger capacity, 5; 15-gallon gasoline
ank, under front seat, 2 gallons in reserve; with
ull tool, tire repair kit and lamps; price, $2750. Spe-
ial feature: closed bodies can be supplied to this
hassis.

LDSMOBILE MODEL Z 7-PASSENGER CAR. $4200.

Oldsmobile Model Z 7-passenger touring car; 6-cylin-
er, vertical, water-cooled motor, 4½x4¾, 48 H. P.
. L. A. M.), under the hood; mechanically operated
alves on one side; Hess-Bright annular ball-bearings
n crank shaft and cam shaft; jump spark ignition

tank, tools and tire repair kit; price, $4200.
can be furnished with runabout and limousine
at extra cost.

OLDSMOBILE 5-PASSENGER TOURING CAR.

Oldsmobile 5-passenger touring car; 4-cylinder,
cooled, 4½x4¾, 32 H. P. motor, under the hood
chanical valves on one side; white bronze crank
bearings, phosphor bronze cam shaft bearings; 3
and reverse selective sliding change speed ge
white bronze bearings, direct on the high; shaft
to semi-floating rear axle; tubular front axle
inch wheel base; 32-inch wheels, on Timken
bearings; 3½-inch front and 4-inch rear tires;
elliptic springs front and rear; front, 36x2¼
and rear, 52x2¼ inches; worm and nut steering
transmission brake, foot-operated; internal exp
hub brakes, hand-operated; passenger capacity,
sons; 14-gallon gasoline tank, under the front
equipment, 2 oil and tail lamps, tools and t
pair kit; price, $1900. Special feature: can
this chassis as a town car or taxicab. 1908 O
bile cars described in our November, 1907,
page 90.

Imperial Gasoline Cars.

Made by the Imperial Motor Car Co., Willian
Pa.

Imperial roadster, fitted with 4-bucket sea
cylinder, vertical, water-cooled motor, 4½ by 5
35 H. P., under the hood, mounted on the frame
is of special dropt design; mechanical valves
one side; Parson's white bronze crank shaf
cam shaft bearings; double ignition system,
Eisemann magneto and dry cells; forced lubri
from pump in oil reservoir in engine crank
metal to metal 5-ring clutch with cork insert
lective sliding change speed gear, mounted on

IMPERIAL ROADSTER. $2650.

bearings, giving 3 speeds forward and 1 re
direct on the high; shaft drive to full floating
axles; front axle solid hand forged; 108-inch
base; 36-inch ball bearing wheels with 3½-inch
special double dropt prest steel frame; semi-e
springs front and rear, front 36 by 2, 6 leaves;
48 by 2, 8 leaves; irreversible and adjustable
mer type steering gear; external camel's hair fib
internal expanding brakes, metal to metal, o
wheels; spark and throttle on wheel; nothing o
but 2-way switch; seating capacity, 1, 2, 3 or

IMPERIAL ROADSTER RUNABOUT. $250
sons; 18-gallon tank at the rear of the frame; w
complete, 2475 lbs.; price, with Solar gas

ers cast in pairs, 4¾x5, 40 H. P., under the on sub-frame; valves on opposite sides, mechan- operated; crank shaft bearings bronze; cam bearings special metal; jump spark ignition storage and dry cells; mechanical lubrication; le disc clutch; 3-speed and reverse, selective, change speed gear, on Hess-Bright ball-bear- direct on the high; shaft drive to floating rear

S-FINCH MODEL H TOURING CAR, $2500.

I-section front axle; 106-inch wheel base; 32- ball-bearing wheels, with 4-inch tires; prest steel and sub-frame; semi-elliptic springs front and front, 38x2 inches, 6 leaves, and rear, 46½x2 , 8 leaves; foot brakes, external on rear hubs; emergency brakes, internal on rear hubs; pas- capacity, 5; 19-gallon gasoline tank, under seat; weight complete, 2400 lbs.; equipment, 3 amps, 2 gas lamps, generator, horn, storage y and tools; price, $2500.

PUNGS-FINCH MODEL 35, $2500.

gs-Finch Model 35 runabout, with rumble or earing rear seat; general chassis specifications ame as Model H touring car; weight, 2200 seating capacity, 3 persons; price $2500.

S-FINCH MODEL F TOURING CAR, $2000.

gs-Finch Model F Touring Car; passenger ca- , 5; 4-cylinder, water-cooled, 4x4½, 22 H. P. , under the hood, on sub-frame; mechanical , all on one side; jump spark ignition from dry positive mechanical lubrication; leather-faced clutch; 3-speed and reverse, sliding change speed on babbitt bearings, direct on the high; shaft to live rear axle; tubular front axle; 98-inch base; 32-inch wheels, on ball-bearings, 3½-inch prest steel frame and sub-frame; semi-elliptic s front and rear; front, 36x2 inches, and rear, inches; worm and sector steering gear; emergen- nd-operated brakes on rear wheels, foot-operated nission brake; passenger capacity, 5; 18-gallon ne tank, on the front seat; weight complete, lbs.; price complete, with 2 oil lamps, tail lamp, and tools, $2000.

drive to floating rear axle; I-section front axl 116-inch wheel base; 34-inch ball-bearing wheels; 4 inch tires; prest steel frame and sub-frame; semi elliptic front and rear springs; front, 38x2 inches, leaves, and rear, 48x2 inches, 8 leaves; worm and sec tor steering gear; internal expanding emergenc brakes, hand-operated on rear hubs; external con tracting service brakes, foot-operated, on rear hubs 19-gallon gasoline tank, on the front seat; passenge capacity, 7 persons; weight complete car, 3000 lbs. price, with 3 oil lamps, 2 gas lamps, generator, horn storage battery, magneto, top and tools, $3500. Fitte with Model H., F. or No. 35 touring or runabout bod as desired.

Gaeth Gasoline Cars.

Made by the Gaeth Automobile Co., Cleveland, Ohio

GAETH TYPE XV, $3500.

Gaeth Type XV, to be fitted with touring, roadste or limousine bodies; motor, 4 cylinders, water-coole 4-cycle, thermal circulation, bore 4⅞-inch, stroke 5¼ inch, 35-40 H. P., located under the bonnet, on three-point suspension; valves mechanically operate on opposite sides of cylinders; cam shaft and cran shaft bearings of special Babbitt; low tension ign tion from dry cells or Simms-Bosch magneto; lubric tion by gear-driven pump; Gaeth contracting ban clutch; sliding change speed gear on special Babbi bearings, giving 3 forward speeds and 1 reverse, dire on high, operated by hand lever; shaft drive to floa ing type ball-bearing rear axle, I-section front axl 112-inch wheel base; 34-inch wheels, mounted on bal bearings and fitted with 4-inch tires; prest steel fram semi-elliptic springs front and rear; front 44x2 inche 9 leaves; rear, 50x2 inches, 10 leaves; steering gea interlocking ball-bearing type; double set of brake internal and external, on separate drums on the re wheel; control of spark and throttle by levers steering wheel; 20-gallon gasoline tank under fro seat; weight complete, 2750 lbs.; passenger capacit 7 persons; equipment, complete set of lamps, ho and tools. Price, $3500. Special features: low te sion ignition system, Gaeth clutch and thermal circ lation. Described November, 1907, page 87.

Lauth-Juergens Gasoline Vehicles.

Made by Lauth-Juergens Motor Car Co., Chicago, I

LAUTH-JUERGENS MODEL D TOURING CAR, $3250.

Lauth-Juergens Model D Touring Car; motor, 4-cy inders, vertical, water-cooled, 5 by 5½, 45 H. P., u der hood on sub-frame; valves on opposite side nickel babbitt crank shaft and phosphor bronze ca shaft bearings; jump spark ignition from 6-volt, 6 ampere storage batteries; splash lubrication; 3-ri friction clutch; 3-speed and one reverse selecti sliding change speed gear on nickeled babbitt bea ings, direct on the high, operated by one leve shaft drive to floating rear axle; front action I-se tion; 118-inch wheel base; 36-inch roller beari wheels with 4½-inch tires; prest steel frame; and

on high, Hess-Bright ball-bearings, operated by lever; shaft drive; tubular front axles. Cadillac al rear axles; tires. 34x4 inches; Hess-Bright l bearings; wheel base, 102 inches; prest steel e; tubular sub-frame; springs semi-elliptic, 44x2 s, 10 leaves, in front, and ¾-elliptic, 48x2 inches, ves, in rear; worm and nut steering gear; inter- xpanding and external constricting brakes on the wheel hub drums; spark and throttle at steering l; speed changes by side lever, brake by foot , emergency brake by side lever, clutch by foot : 18-gallon gasoline tank, located under front equipment, 3 oil lamps and horn. Furnished a limousine body, 43x4½-inch tires, $3600. 8 Cadillac cars described in our November issue, 88.

Autocar Gasoline Cars.

Made by the Autocar Co., Ardmore, Pa.

AUTOCAR ROADSTER, $1200.

tocar Roadster, type XV; price $1200; seats 3; I. P., 4-cylinder, horizontal, water-cooled motor, ed under hood, on three-point suspension; bore stroke 4-inch; automatic inlet valves; crank and shaft bearings of plastic bronze; jump spark ion, by storage and dry cells; automatic oil and h lubrication; clutch of floating ring type in fly- l; progressive type, sliding change speed gear, speeds forward and one reverse, direct on Hyatt roller bearings in transmission; shaft ; change speed gears, controlled by side lever; rear axles and seamless tubing front axle; tires inch front and rear; ball-bearings in front wheels; l base 80 inches; frame of 25 per cent. carbon hot steel; springs semi-elliptic, 35x1¾-inch, 5 leaves ont, and full elliptic scroll end springs, 36x1¾- 5 leaves, in rear; pinion and sector steering internal and external brakes on each rear wheel; and throttle control by grips on hand wheel; ht 1450 pounds; gasoline capacity 10 gallons, located under hood.

UTOCAR TYPE XIV TOURING CAR. $2750.

cal, water-cooled, 4-cycle motor, placed under on three-point suspension; cylinders 4¼-inch 4½-inch stroke; mechanical inlet valves; crank and cam shaft bearings plastic bronze; ignition ump spark, with storage and dry cells; McCord feed oiler on dash; clutch of floating ring type ywheel; progressive change speed gear; Hyatt

AUTOCAR TYPE XIV ROADSTER. $2750.

and throttle grip in hand wheel; capacity 5 person gasoline capacity 16 gallons, tank located under sea weight, 2600 lbs.; price $2750, including gas and side lamps and full line of tools; special feature: r serve gasoline tank. This Type XIV chassis is al furnished with a roadster body, seating three pe sons, at $2750; weight, 2250 lbs. 1908 Autocars d scribed in our November, 1907, issue, page 156.

Wayne Gasoline Cars.

Made by the Wayne Automobile Co., Detroit, Mic

WAYNE MODEL 30 TOURING CAR. $2500.

Wayne Model 30, 5-passenger touring car; pric $2500; 4-cylinders, 4-cycle, vertical, water-cooled, 4 in, bore by 5¼-in. stroke; 35 H. P. motor, set und hood on main frame; Parsons bronze crank shaft bea ings; phosphor bronze cam shaft bearings; jump spar with storage battery, magneto extra splash lubricatio internal expanding clutch; 3 speeds and reverse; s lective sliding change speed gear, direct on hig operated by hand lever, mounted in Parsons bra

WAYNE MODEL 30 ROADSTER, $2500.

bearings; bevel gear drive; 34x3½ front tires a 34x4 rear tires; ball wheel bearings, 106-inch whe base; prest steel frame; semi-elliptic springs, fro and rear; 38x2¼-inch, 6 leaves front, and 50x2¼-inc 8 leaves in rear; screw and nut steering gear, e ternal and internal brakes on hubs; throttle a spark levers on steering post under steering whe capacity, 5; 18-gallon gasoline tank under fro seat; equipment, 5 lamps, top and tools.

anical valves on the right side, with a single cam haft; Parsons white brass cam shaft and crank haft bearings; dual jump spark ignition, using storze battery and magneto; mechanical force feed lubriation; internal ring clutch; Gearless friction change peed gear, mounted on ball-bearings and giving 2 peeds forward and 1 reverse, direct on the high peed, operated by pedals; shaft drive to semi-floating ar axle; front axles, I-section; 126-inch wheel base; 6-inch wheels, front on ball-bearings and fitted with

GEARLESS SIXTY "GREYHOUND," $3500.

inch tires, rear on roller bearings and fitted with ½-inch tires; nickel steel frame and sub-frame; semiliptic springs front and rear; front, 39x2 inches, 7 aves, and rear, 50x2 inches, 8 leaves; steering by orm and trunnion nut; 16-inch hand wheel; 5 brakes, e on the transmission, 4 rear hub brakes, operated a side lever; spark and throttle levers on steering heel; 34-gallon gasoline tank, hung at the rear of e frame; passenger capacity, 3 or 4 persons; weight complete car, 3000 pounds; equipment: 2 gas lamps, side oil lamps, 1 tail lamp, horn and generator. rice, $3500. Special features: "Gearless" transmison.

GEARLESS SIXTY, $3500.

Gearless Sixty, 5-passenger touring car; 4-cylinder, ertical, water-cooled, 4-cycle, 60 H. P. motor, under e hood at the front, on sub-frame, 5x5¾; valves right side, mechanically operated; general chassis ecifications similar to the Gearless Sixty "Greyound" except the weight, which is 3385 lbs., and e body, which is of the 5-passenger touring type; th 2 gas lamps, 2 side oil lamps, 1 tail light, coat d foot rails, horn and generator; car sells for $3500.

GEARLESS MODEL 75, $4000.

Gearless Model 75, 7-passenger touring car; 6-cylinr motor, water-cooled, 4-cycle, 4 13-16x5½-inch, 75 P., located under the hood at the front, on a b-frame; mechanical valves on opposite sides of the linder heads; crank shaft and cam shaft bearings of arsons white bronze; dual ignition from storage battry and magneto; lubrication by pump in the crank se; internal ring clutch; "Gearless" friction transission on ball-bearings, giving 2 speeds forward and reverse, direct on the high, operated by foot levers; aft drive to semi-floating rear axle; I-section front le; 126-inch wheel base; 36-inch wheels, front fitted th 4-inch tires and on ball-bearings, rear fitted

GEARLESS 75 "GREYHOUND," $4000.

Gearless 75 "Greyhound:" this high-powered about seats 3 or 4 passengers and is fitted wit same 6-cylinder motor as the Model 75 Touring the general specifications are also the same, the weight is but 3000 lbs. Price, $4000, wit same equipment as the Model 75. Gearless 1908 described in our September, 1907, issue, page

Halladay Gasoline Cars.

Made by the Streator Motor Car Co., Streator

HALLADAY MODEL C TOURING CAR. $30

Halladay Model C touring car; 4-cylinder, ver water-cooled, 4⅝ by 5, 35-40 H. P. motor, lo under the hood on trussed frame; mechanical v on one side; ball bearing crank shaft and cam bearings; jump spark ignition from storage ba dry cells or magneto, if desired; Hill precision leather covered spring clutch, 3 speeds forward 1 reverse sliding change gear on ball bearings, on the high, shaft drive to floating rear axle; axle I-section; 118-inch wheel base; 34-inch w on double sets of ball bearings; 4-inch tires, steel frame and sub-frame; semi-elliptic springs and rear; 44 by 2 inches, 7 leaves, at the 50 by 2 inches, 10 leaves, at the rear; worm gear steering; internal expanding and external tracting brakes on rear wheels; 15-gallon ga tank under the front seat; passenger capaci or 7 persons; weight, complete, 2650 lbs.; equip Prest-O-Lite gas tank and full Solar lamps, F horn and tools; price, $3000. Same chassis i ted with runabout, limousine or touring car bodi

Bellefontaine Gasoline Automobiles

Built by the Bellefontaine Automobile Co., fontaine, O.

BELLEFONTAINE MODEL B-8. $2500.

Bellefontaine Model B-8; King of Belgium 4-cylinder, vertical motor under the hood, 4⅜ by inch 32 H. P.; valves located on one side of ders; force feed lubrication cone clutch; sel three speed and one reverse change speed gear, m ed on ball bearings and operated by hand lever; drive to floating type rear axle; front axle I-se drop forging; 112-inch wheel base; wheels on bearings and fitted with 34 by 4-inch sta

THAM MODEL D. L. TOURING CAR. $1800.

tham Model D. L touring car; 4-cylinder, ver- air-cooled, 4-cycle, 4x4¼, 20 H. P. motor un- ood on 4 point suspension; mechanical valves ad; jump spark ignition from storage and dry mechanical oiler; cone clutch, progressive slid- hange speed gear on Parson's bronze bearings, speeds, direct on high, operated by hand lever; drive; 32-inch wheels on ball-bearings front, rear; 3½-inch tires; 96-inch wheel base; press- eel frame and sub-frame; semi-elliptic springs,

ALTHAM MODEL D. R RUNABOUT. $1750.

ches long front and 45 rear, 6 leaves; wheel ng; internal expanding hub brakes and brake aft; passenger capacity, 5; weight, 1850 pounds; llon gasoline tank under front seat; price, in- g gas and oil lamps, horn and tools, $1800.

ltham Model D. R.; this car is the same as the l D. L. touring car, but is fitted with runabout weight, 1700 pounds; price, $1750.

WALTHAM MODEL 17. RUNABOUT. $350.

ltham Model 17, runabout; single cylinder, ver- air-cooled, 4-cycle, 3¼x4¼, 4 H. P. motor in valves automatic; ignition from 4 dry cells; pump lubrication; friction transmission, 5 ls, on Parson's bronze bearings, operated by lever; double chain drive; 26x2½-inch tires;

26x2½-inch tires; wheels on ball-bearings, wheel base; ash frame; elliptical springs, 19 inches long, front 3 leaves, 22 inches long rear; 4 leaves

WALTHAM, MODEL 27. RUNABOUT. $525.

tiller steering; external band and internal expand ing brakes; passenger capacity, 2; weight, 70 pounds; 3½-gallon gasoline tank rear of seat; price including tools, $525.

Waltham Model 28, runabout; same general spec fications as Model 27; furnished with wheel stee ing; price, $600.

WALTHAM MODEL E T. $650.

Waltham Model E T; 4-passenger tonneau car; cylinder, 4-cycle, V motor, air-cooled, 4x3¼, 8 H. P located in rear on frame on 4-point suspension; m chanical valves in head; jump spark ignition fro dry cells; mechanical oiler; friction transmission, speeds; double chain drive; 26-inch wheels on ba bearings; 2½-inch tires; 84-inch wheel base; a frame; elliptical springs, 19 inches long in front, inches in rear, 4 leaves; wheel steering; intern expanding brakes; passenger capacity, 4; weigh 850 pounds; 5-gallon tank on back of seat; price, $65 including tools.

Waltham 1908 cars described in our December, 190 issue. Page 96.

Wolf Air-Cooled Gasoline Cars.

Made by the H. E. Wilcox Motor Car Co., Minnea olis, Minn.

Wolf touring car; 4-cylinder, vertical, air-cool motor, 4 by 4, 24 H. P., located under the hood sub-frame; mechanical valves in cages on top cylinders; Parson's white brass crank shaft bea ings; bronze cam shaft bearings; jump spark igniti from storage batteries, dry cells and magneto special order; force-feed mechanical lubrication; co clutch with flat springs under the leather; 3-speed a reverse sliding change gear on bronze bearings, dire on the high, progressively operated; side chain dri to 1½-inch solid rear axle, front axle, 1½-inch sol 108-inch wheel base; 34-inch wheels on Timken ro

Locomobile Gasoline Cars.

by the Locomobile Co. of America, Bridgeport, Conn.

COMOBILE MODEL I STANDARD, $4750.

mobile Model I Standard, side entrance tonneau; der, vertical, water-cooled, 5x6, 40 H. P. motor, l under the hood; bronze crank case bolted to mechanical valves on opposite sides, all parts ed; crank shaft bearings alloy steel and bab- cam shaft bearings hard steel and babbitt; n, make-and-break from magneto; automatic feed lubrication; special cone clutch; change gear, selective type, or Hess-Bright bearings, 4 speeds forward and 1 reverse, direct on the operated by single hand lever; double side drive; front and rear axles I section; 123-inch base; Hess-Bright bearings, 36-inch wheels, 4- front tires, 4½-inch rear tires; frame, prest steel, no sub-frame; semi-elliptic springs front ear, front 4x2, rear 50x2 inches; irreversible steering gear; all metal brakes, contracting on countershaft; internal brakes on rear wheels; and gas lever on steering wheel, also foot e; 23-gallon gasoline tank, under seat; carrying ty, 7 persons; equipment, Rushmore headlights, amps, rear lamps, generator, tools, jack and apron; price, $4750.

OCOMOBILE MODEL E LIMOUSINE, $4200.

omobile Model E Limousine; 4-cylinder, water- vertical, 3¾x4½-inch, 20 H. P. motor, under ood at the front, supported by bronze crank case frame; mechanical valves on opposite sides and rts enclosed; make-and-break ignition from mag- automatic force feed lubrication; special cone ; selective sliding change speed gear, on Hess- bearings, with 4 speeds forward and 1 re- direct on the fourth, operated by single hand drive, double side chains; I-section rear and axles; 116-inch wheel base; 32-inch Hess-Bright earing wheels, 4-inch front and 4½-inch rear prest alloy steel frame, no sub-frame; semi-

LOCOMOBILE MODEL E STANDARD, $2900.

which is 102 inches, and 32x4-inch tires all around, same as Model E Limousine. Body, side entrance tonneau; seats 5 persons; with same equipment as other models, $2900. Locomobile 1908 models described in our August, 1907, issue, page 56.

Acme Gasoline Cars.

Made by the Acme Motor Car Co., Reading, Pa.

Acme Type 18 Touring Car; price, $4000; 4-cylinder, water-cooled, vertical, 4-cycle, 30 H. P. motor, located under hood and suspended on sub-frame; cylinders, 4½-inch bore, 5-inch stroke; mechanical valve action; cam shaft bearings of bronze and crank shaft bearings of Parsons white bronze; ignition, jump spark with storage and magneto; lubrication by force feed and splash systems; leather-faced cone clutch; selective sliding change speed gear on D. W. F. ball bearings, 4 speeds forward and 1 reverse, direct on high, operated by side lever; chain drive; front axle I-beam section, and rear axle square nickel steel

ACME TYPE 18 TOURING CAR, $4000.

tires, 36x4 inches in front, 36x4½ inches in rear wheels on Timken roller bearings; wheel base, 115½ inches; frame of prest steel; springs, semi-elliptic front and rear, 44x2 inches, 7 leaves, in front, and 52x2 inches, 10 leaves, in rear; irreversible worm and nut steering gear; internal expanding and external constricting brakes on rear wheels; spark and throttle control on wheel; capacity, 7 persons; 25-gallon gasoline tank, located under front seat; weight, 3500 lbs. price, including cape cart top, 2 acetylene headlights side oil lamps, tail lamp, horn, tool kit, gas tank $4000.

ACME TYPE 21 RUNABOUT, $4250.

Acme Type 18 Touring Car is also furnished with runabout body, known as Type 21, specifications which are the same, excepting the following: Gasoline capacity, 20 gallons, and weight, 3200 lbs.; rear springs, 9 leaves. Price, $4250.

Acme Type 16 Runabout; price, $3500; the general specifications are the same for this car as for Type 18 Touring Car chassis, excepting the wheel base which is 102½ inches; gasoline capacity, 20 gallons rear springs, 48x2 inches, 9 leaves; weight, 2400 lbs capacity, 3 persons.

he hood on a 4-point suspension; valves in the head operated by tappet rods; crank shaft bearings, babbitt; jump spark ignition from magneto and dry cells; force-feed lubrication; metal to metal cone clutch with cork inserts; sliding change speed gear on Hess-Bright bearings, giving 4 forward and 1 reverse speed, direct on high, and selectively operated; double chains to rear wheels; rear and front axles I-section; 112-inch wheel base; 34-inch wheels on Hess-Bright bearings; front tires, 4-inch, rear, 4½; prest steel frame, no sub-frame; semi-elliptic front and rear springs; nut and screw steering gear; foot brake on differential, lever brake to each rear hub; spark and throt-

KNOX MODEL G TONNEAU AIR-COOLED CAR. $4000.

le levers on the steering wheel, also foot accelerator; 40-gallon gasoline tank under tonneau; weight, complete, 2800 lbs.; price, with oil side and tail lights, 2 gas head lights, horn, odometer and complete tool equipment, $4000. 1908 Knox cars described in our Jan., 1908, issue, page 182.

Knox Model G limousine, 6-passenger car; 4-cylinder, air-cooled, 4¾ by 5½, 40 H. P., located under the hood; valves in the cylinder heads, tappet rod operated; crank shaft bearings babbitt; jump spark ignition from magneto and dry cells; force-feed lubri-

KNOX MODEL G LIMOUSINE. $5000.

ation by internal leads; cone clutch, metal to metal, cork inserts; sliding change speed gear on Hess-Bright bearings, giving 4 speeds forward and one reverse, direct on high, operated on the selective system; drive, double side chains; rear axle, I-section, also front axle; 112-inch wheel base; front wheels, 34 by 4-inch tires; rear, 4½-inch tires, all mounted on Hess-Bright bearings; prest steel frame; semi-elliptic springs front and rear; steering gear, nut and screw; foot brake on differential; side lever operating brakes on rear hub; spark and throttle levers on steering wheel; 40-gallon gasoline tank under body; weight, complete, 3200 lbs.; price, with oil side and tail lights, 2 gas head lights, horn, odometer and full set of tools, $5000.

KNOX MODEL H TONNEAU CAR. $2600.

Knox Model H, 4-cylinder motor, air-cooled, 4¾

headlights and generator, oil side and tail jack and full set of tools, $2600. Special fe straight line drive.

KNOX MODEL H LANDAULETTE AIR-CO $3500.

Model H Landaulette; 4-cylinder, air-cooled 4¾ by 4¾, 30.6 H. P., located under the hood point suspension; general specifications same as el H touring car. Price, $3500.

KNOX MODEL H AIR-COOLED 3-PASSEN TOURIST. $2500.

Knox Model H, 3-passenger tourist; air-cool cylinder motor. General specifications same as H touring car. Price, fully equipped, $2550.

KNOX MODEL H 4-PASSENGER TOURIST. COOLED. $2600. MODEL L, WATER-COOLED. $2700.

Knox Model H air-cooled or water-cooled 4-p ger tourist; general specifications the same as H touring car.

KNOX MODEL L TONNEAU. WATER-COO $2700.

Knox Model L tonneau, water-cooled car. $2700; general specifications same as Model H to car.

PIERCE GREAT ARROW. $4000.

e Great Arrow touring car; 4-cylinder, 4-cycle, l, water-cooled, 4¼x4¾, 30 H. P. motor in supported on cross girders; mechanical valves, and exhaust on opposite sides of cylinder; 3 or bronze crank shaft bearings, 3 phosphor cam shaft bearings; two independent ignition s; storage battery, spark coils and high tension o; special lubrication; leather faced cone clutch cork inserts; progressive sliding change gear ss-Bright ball bearings; 3 speeds forward and , direct on high; operated by lever on steer- lumn; propeller shaft drive; live rear axle; h wheel base; frame, pressed steel channel sec- semi-elliptic springs, front 38 inches long, es wide, six leaves; rear, 50 inches long, 2 wide, 8 leaves, steering by nut and screw; rnal foot brakes and 2 external hand lever on rear wheels; speed change, throttle and levers on steering column; left foot lever for right for brake; passenger capacity, 5; 19-gal- soline tank under seat; equipment, 2 side oil 1 tail oil lamp, 3 gas head lamps and gen- horn, full set of tools, gasoline tank gage; odometer, 4 Hartford shock absorbers, ex- e carrier and trunk rack; price, $4000.

PIERCE GREAT ARROW. $5000.

e Great Arrow touring car; 4-cylinder, verti- ater-cooled, 4-cycle, 5x5½, 40 H. P. motor in n cross girders; mechanical valves; inlet and on opposite sides of cylinders; 3 phosphor crank shaft and cam shaft bearings; two in- ent ignition systems from storage battery, coils and high tension magneto; special lubri- leather faced cone clutch with cork inserts; sive sliding change speed gear, on Hess-Bright earings, 3 forward speeds and reverse, di- high, operated by lever on steering column; r shaft drive; live rear axle; solid I section axle; wheels on ball bearings; 4-inch tires 5-inch rear; 124-inch wheel base; prest steel section frame; semi-elliptic springs, front es long, 2 inches wide, 7 leaves, rear, 55 inches; nes wide, 9 leaves; steering by nut and screw; nal foot, operated brakes and 2 external hand rakes on rear wheels; speed change, throttle ark levers on steering column, foot levers for and brake; passenger capacity, 7; 20 gallon tank, under seat; equipment, 2 side and 1 lamps; 2 gas head lights and generator, horn of tools, gasoline tank gage; Veeder odometer, ford shock absorbers; extra tire carriers and ack; price $5000. Suburban car furnished on hassis.

on steering column; propeller shaft drive; live rear axle; solid I beam front axle; wheels on ball bearings; 4-inch tires front, 5-inch rear; 130-inch wheel base; prest steel channel section frame; semi-elliptic springs, 40 inches long, 2 inches wide, 7 leaves, front 55 inches, long, 2¼ inches wide, 9 leaves; steering nut and screw, 2 internal foot-operated and 2 external hand lever-operated brakes on rear wheels; speed change; throttle and spark levers on steering column, foot levers for clutch and brake; passenger capacity, 7; 20 gallon gasoline tank under seat; equipment, 2 oil side lamps, 1 tail oil lamp, 2 gas head lamps and generator, horn, full set of tools, gasoline tank gage; Veeder odometer, 4 Hartford shock absorbers; extra tire carriers and trunk rack; price, $5500. Also furnished with suburban and road car bodies.

PIERCE GREAT ARROW. $6500.

Pierce Great Arrow touring car; 6-cylinder, vertical, water-cooled, 4-cycle, 5x5½, 60 H. P. motor in front on cross girders; mechanical inlet and exhaust valves on opposite sides of engine; 7 phosphor bronze crank shaft and 4 phosphor bronze cam shaft bearings; 2 independent ignition systems from storage, battery and spark coils and high tension magneto; special lubrication; leather faced cone clutch with cork inserts; progressive sliding change speed gear on Hess-Bright ball bearings; 3 forward speeds and reverse; direct on high, operated by lever on steering column; propeller shaft drive; live rear axle, wheels on ball bearings, 4½-inch tires front; 5-inch rear, 135-inch wheel base; prest steel channel section frame; semi-elliptic springs, front, 40 inches long, 2 inches wide, 8 leaves, rear, 55 inches long, 2¼ inches wide, 10 leaves; nut and screw steering; 2 internal foot-operated brakes and 2 external hand lever-operated brakes on rear wheels; speed change, throttle and spark levers on steering column, foot levers for clutch and brake; passenger capacity, 7 persons; 25 gallon gasoline tank under seat; equipment, 2 side oil lamps, 1 tail oil lamp, 2 gas head lamps and generator; horn, full set tools, gasoline tank gage, Veeder odometer, 4 Hartford shock absorbers; extra tire carriers and trunk rack; price, $6500. Suburban and road car bodies also furnished. Pierce Great Arrow cars described December, 1907, page 120.

Winton Six-Teen-Six Touring Car.

Made by the Winton Motor Carriage Co., Cleveland, Ohio.

WINTON SIX-TEEN-SIX TOURING CAR. $4500.

Winton Six-Teen-Six, 6-cylinder, 7-passenger touring car, price $4500; vertical, water-cooled, 4-cycle, 4½-inch bore by 5-inch stroke; 48.6 H. P. motor, set under bonnet on drop frame; mechanically operated valves; phosphor bronze crank and cam shaft bearings; jump spark ignition, by storage battery and Eiseman magneto; mechanical lubrication; multiple disc clutch, 3 speed and reverse selective sliding change speed gear, direct on 3rd, operated by lever, mounted in Hess-Bright bearings; shaft drive;

GLIDE MODEL H 6-CYLINDER CAR. $5000.

Glide Model H 6-cylinder straight line body touring car; motor under the hood on sub-frame, 4½x5-inch, 54-60 H. P.; mechanical valves on one side; special die cast Babbitt bearings on crank shaft and cam shaft; jump spark ignition, storage battery and Eisemann magneto; positive lubrication; multiple disc clutch; sliding change speed gear, on Timken roller bearings, 3 speeds forward and 1 reverse, direct on high, operated by side lever, with thumb button release; shaft drive to bevel gear; front axle; triangular section; wheel base, 132 inches; 36-inch wheels, on Timken roller bearings, 4½-inch tires; prest steel frame and sub-frame; semi-elliptic springs front and rear; front, 40x2 inches, 7 leaves; rear, 58x2 inches, 10 leaves; worm and sector steering gear; internal and external brakes on rear wheels; spark and throttle control on steering wheel; 18-gallon gasoline tank, under front seats; passenger capacity, 5 or 7; equipment, oil lamps, horn and tools. Price $5000. Special feature: large brake surface.

GLIDE MODEL G. $2500.

Glide Model G, 4-cylinder touring car; straight line body; capacity, 5 or 7 passengers; motor, water-cooled, using fan and circulating pump, 4½x5-inch, 40 H. P., motor under the hood, on sub-frame; valves on one side of engine mechanically operated; die cast Babbitt crank shaft and cam shaft bearings; jump spark ignition, from storage and dry cells; positive force feed oiler; multiple disc clutch; sliding change speed gear on Timken roller bearings, giving 3 speeds forward and 1 reverse; shaft drive to bevel gear; live rear axle; I-section front axle; wheel base, 120 inches; wheels on Timken roller bearings, 34 inches diameter, with 4-inch tires front and rear; prest steel frame and sub-frame; semi-elliptic springs, 40 inches long in the front by 2 inches, 7 leaves; rear, 58 inches long by 2 inches, 10 leaves; worm and sector steering gear; two sets of brakes, internal and external, on rear wheels; spark and throttle control on steering wheel; change gear by hand lever; 18-gallon gasoline tank on the front seat; weight complete, 3100 lbs.; equipment, oil lights, side lights and tail lights. Price, $2500. Special feature: powerful brakes for hilly work.

GLIDE MODEL G SPECIAL. $3000.

on steering wheel; 18-gallon gasoline tank, front seat; passenger capacity, 5 or 7; weigh plete, 3200 lbs.; equipment, horn, oil lamps and Price, $3000.

Great Smith Gasoline Cars.

Made by the Smith Automobile Co., Topeka,

Great Smith Type S tonneau car; 4-cylinder, cal, water-cooled, 4½ by 5, 24 H. P. motor und hood in the front on 3-point suspension; mecha operated valves on opposite sides of the cyl crank shaft and cam shaft bearings of swage bitt; jump spark ignition from storage batter cells and magneto, dynamo, if desired, extra; automatic lubrication; multiple disc clutch; 3 forward and 1 reverse "Great Smith" sliding speed gear, direct on the high, mounted on T roller bearings, operated by lever; shaft drive vided live rear axle; front axle single piece

GREAT SMITH TYPE S TONNEAU CAR.

forging; 110-inch wheel base; 34-inch whe Timken roller bearings, 4-inch tires; trussed frame, no sub-frame; full elliptic springs fro rear, 36 by 1½ inches, 8 leaves; "Great Smit ternal sector and worm steering gear; cone brakes on each rear wheel and band brake on mission; spark and throttle on stationary sec steering wheel; 15-gallon gasoline tank on fron capacity, 5 persons; weight, complete, 2475 equipment: complete oil and gas lamps and rep tool outfit; price, $2750. Special features: change gear, operated by a single lever, whic matically disengages the clutch, special wood and steering gear.

SMITH TYPE T ROADSTER. $2650.

Smith Type T roadster; 4-cylinder, wate motor, 4½ by 5, 24 H. P., under the hood point suspension; general arrangements of the sis similar to the tonneau car, Type S; wheel 110 inches, but 36-inch wheels with 4-inch ti used; the weight complete is 2200 lbs., and th ing capacity is 3; with the same outfit as th car the price is $2650. 1908 cars described November, 1907, issue, page 77.

Monarch Gasoline Cars.

Made by the Monarch Machine Co., Des Moines

MONARCH MODEL D ROAD KING. $750

Monarch Model D Road King, price $750.00 4; 2-cylinder, 4-cycle, water cooled, horizontal, bore and stroke; 20 H. P. motor, set in center mechanically operated valves; bronze crank sh cam shaft bearings; jump spark ignition by dr

ULLMAN MODEL 4-40 RUNABOUT. $3000.

nan Model 4-40 runabout; 4-cylinder, vertical, cooled, 4-cycle, 4 15-16x5¼-inch, 40 H. P. under hood on four-point suspension; valves nt and left of cylinders, white brass crank shaft gs, cam shaft bearings, bearing bronze; jump ignition from storage, dry cells and magneto; feed lubrication to crank base and cylinder; lutch with cork inserts; selective sliding change gear on Hess-Bright bearings, 3 forward and verse speed, direct on the third speed, operated ver through H slot; shaft drive to live rear front axle I-section; 34-inch wheels on roller gs; 4-inch tires; wheel base 108 inches; prest frame and sub-frame; semi-elliptic springs, 39 long, 2¼ inches wide, 9 leaves, front and 50 long, 2¼ wide, 7 leaves rear; nut and screw teering gear; 2 sets brakes on rear wheels; spark rottle friction retained on top of steering wheel; ger capacity, 3; weight, complete, 2350 pounds; on gasoline tank under front seat; price, $3000. ng lamps, horn, etc. Special features, high

LLMAN MODEL 6-30 RUNABOUT. $2750.

an Model 6-30 runabout; 6-cylinder, vertical, cooled, 4-cycle, 3¾x3¾-inch, 30 H. P. motor under hood on 4-point sub-frame; mechanical on right side of engine; crank shaft bearings, brass, cam shaft bearings, bearing bronze; spark ignition from storage and dry cells and o; force feed lubrication to crank case; cone with cork inserts; selective sliding change gear on Hess-Bright bearings, 3 speeds forward, rse, direct on third speed, operated by lever H slot; shaft drive; floating rear axle; I-front axle; 34-inch wheels on roller bearings; tires rear; 104-inch wheel base; pressed steel and sub-frame; semi-elliptic springs, 36 inches inches wide, 5 leaves front, 45½ inches long, es wide, 7 leaves rear; steering gear, nut and type; 2 sets of brakes on rear wheels; spark rottle friction retained on top of steering passenger capacity, 3; weight complete, 1950 12-gallon gasoline tank under front seat; $2750, including lamps, horns, etc. Special fea- high power, light weight and speed.

LLMAN MODEL H TOURING CAR. $1875.

an Model H, detachable tonneau touring car; steering gear; 2 brakes on rear wheels, emergenc brake on drive shaft; spark and throttle friction re tained on top steering wheel; passenger capacity, 5; weight, 1900 pounds; 12-gallon gasoline tank under front seat; price $1875, including lamps, horn, etc.

Model H Touring Car is convertible into runabout by removing tonneau and placing deck in place of same. Price $1825.

PULLMAN MODEL I TOURING CAR. $3250.

Pullman Model I, 5-passenger touring car; 4-cylinder, vertical, water-cooled, 4-cycle, 4 15-16x5¼, 40 H. P. motor under hood on 3 point suspension; valves at right and left of cylinders; crank shaft bearings, white brass, cam shaft bearings, bearing bronze; jump spark ignition from storage and dry cells and magneto; force feed lubrication to crank case and cylinder; cone clutch with cork inserts; selective 4 speed and reverse change speed gear on Hess-Bright bearings, direct on third speed, operated by lever through H slot; shaft drive; floating rear axle, I-beam front axle with roller bearing steering knuckles; 34-inch wheels on roller bearings; 4-inch tires front, 4½ rear; 118-inch wheel base; prest steel frame and sub-frame; half elliptic springs front, 41 inches long, 2¼ inches wide, 8 leaves; rear, platform 3 point, 44 inches long sides and 40 inches cross springs, 2¼ inches wide, 8 leaves; nut and screw type steering gear; 2 sets brakes on rear wheels; spark and throttle friction retained on top of steering wheel; weight, 3000 pounds; 18-gallon gasoline tank under front seat; price, $3250, including lamps, horn, etc.

PULLMAN MODEL J TOURING CAR. $3500.

Pullman Model J; this model is the same as Model I, with extension cape top and two extra folding chairs in tonneau; price $3500.

1908 Pullman cars described in our October, 1907, issue. Page 126.

Selden Gasoline Cars.

Made by the Selden Motor Vehicle Co., Rochester, N. Y.

SELDEN MODEL 28. $2000.

Selden Model 28 touring car or runabout, 4-cylinder, vertical, water-cooled, 4-cycle, 4¼x4½, 28-30 H. P. motor located in front on sub-frame, all valves on one side; white brass crank shaft and cam shaft bearings; jump spark ignition from dry cells; magneto selective change speed, gear on Timken roller bearings; direct on third speed, operated by hand lever; extra; pump lubrication; leather cone clutch; 3 speed bevel gear drive; tubular rear axle, front axle I-beam

or. 4½x4¾, under the hood, on sub-frame; valves echanically operated, on opposite sides; crank shaft nd cam shaft bearings D. W. F. ball-bearings; jump park ignition from storage battery and Bosch magneto; mechanical sight feed oiler; self-contained cone utch, spring cushioned; selective type, sliding hange speed gear, on annular ball-bearings, giving 3 orward speeds and 1 reverse, direct on high; shaft rive to floating type rear axle; front axle tubular; 16-inch wheel base; 36-inch wheels, on annular ball-earings; 4½-inch tires; prest steel frame and sub-rame; semi-elliptic springs front, and platform rear; ront, 40x2, 7 leaves, and rear, 50x2, 9 leaves; steer-g, gear and sector; double set of internal expanding etal-to-metal brakes on the rear hubs; control by park and throttle on the steering wheel, also foot hrottle; 17-gallon gasoline tank, on the front seat;

NATIONAL MODEL R. $4200.

eight complete, 3000 lbs.; equipment, 2 Rushmore as lamps, generator, 2 side oil lamps, tail lamp, torm apron, horn and tools; price, $4200. Special eatures: cast aluminum body, ball-bearing thruout, ncluding engine; accessible rear axle mechanism.

This same chassis is used for Model R Roadster, unabout, touring car and limousine.

National Model K 7-passenger touring car, with urved line cast aluminum body; 4-cylinder, vertical, vater-cooled motor, 4⅞x5, under the hood, on sub-rame; mechanically operated valves on opposite sides; rank shaft and cam shaft bearings D. W. F. ball-earings; jump spark ignition from storage battery nd magneto; mechanical sight feed oiler; aluminum one clutch, self-contained, spring cushioned; 3 speeds nd reverse, selective, sliding change speed gear,

ATIONAL MODEL K 7-PASSENGER CAR. $3500.

n annular ball-bearings, direct on the high; shaft rive to floating rear axles; front axle tubular; 112-nch wheel base; 34-inch wheels, on annular ball-bear-gs; 4½-inch tires; frame and sub-frame prest steel; emi-elliptic front springs, platform rear; front, 40x2 nches, 7 leaves, and rear, 50x2 inches, 9 leaves; rew and nut steering gear; double system of brakes internal expanding, metal-to-metal type, on rear heels; control by spark and throttle levers on steer-g wheel, also foot accelerator; 17-gallon gasoline nk, on the front seat; weight complete, 2750 lbs.; quipment, 2 gas lamps, generator, 2 side oil lamps, il lamp, storm apron, tools and horn; price, $3500.

This same chassis forms the basis for Model K adster, runabout, touring car and limousine.

NATIONAL MODEL N. $3700.

National Model N, curved line cast or straight line eet aluminum body; seats 7 passengers; 4-cylinder, ertical, water-cooled motor, under the hood, on sub-ame; bore 5, stroke 5; mechanically operated valves, n opposite sides; other general specifications same Model K; price $3700; weight complete, 2750 lbs.; me chassis is used for roadster, runabout, touring r and limousine.

NATIONAL MODEL T. $5000.

steering wheel, also foot accelerator; 20-gallon line tank, on the front seat; weight, 3750 lbs.; the same general equipment as the other cars; $5000.

Same chassis used for Model T touring car limousine.

1908 National models described in our Dece 1907, issue, page 110.

Pope-Tribune Gasoline Cars.

Made by the Pope Mfg. Co., Hagerstown, M

POPE-TRIBUNE MODEL X. $1750.

Pope-Tribune Model X, with runabout or 4-pass touring car body; motor, 4-cylinder, vertical, 16-P., located under the hood; mechanical valv the head; jump spark ignition from dry cells; chanical oiler; splash and grease cup lubric inverted cone clutch; 3 speeds and reverse s change speed gear, direct on the high; shaft to floating rear axle; forged front axle; 9

POPE-TRIBUNE MODEL X RUNABOUT.

wheel base, 32-in. wheels, 3½ front and rear tire mor wood frame, prest steel sub-frame; 2 se brakes, one on transmission shaft and expanding in drums of the rear wheels; passenger capaci with runabout body, or 4 with touring car 10½ gallons gasoline under the seat; equipme lamps, tools and horn, $1750. Described M 1907, page 263.

POPE-HARTFORD MODEL M. $2750.

Pope-Hartford Model M; 4-cylinder, vertical, cooled, 30 H. P. motor, located under the hood chanical valves in the head; jump spark ignition dry cells and storage battery; provision mad magneto; mechanical oiler, splash and grease lubrication; cone clutch with cork inserts; 3 and reverse selective sliding change speed gea rect on the high; shaft drive to floating rear solid forged front axle; wheel base, 112 inches inch wheels, 3½-inch front and 4-inch rear

TAR MODEL 12 TOURING CAR. $1250.

Model 12, 5-passenger, tilting body, touring car, $1250; 2-cylinder, horizontal, opposed, 24 horse water cooled motor, 5-inch bore by 7-inch set under body on cross frame; mechanically ed valves; nickle babbitt crank shaft bearings onze cam shaft bearings; spark ignition, by dry mechanical lubrication; 3-plate metallic disc; l planetary change speed gear, direct on high, ed by lever, and mounted in bronze bearings; chain drive, roller bearing rear axle and tubu- nt axle; 32 by 3½-inch tires; ball wheel bear- 00-inch wheel base; angle steel frame, full ellip- rings, 36 by 1¾-inch, 5 leaves, front and rear; and sector steering gear; 2 brakes on differential e on transmission; spark and throttle control on steering wheel; seats 5; weight, 1800 lbs.; 16- gasoline tank, under hood; equipment includes d oil lamps, generator, horn and tools.

TAR MODEL 14 TOURING CAR. $1350.

Model 14, 5-passenger touring car, price $1350; base, 104 inches; 20-gallon gasoline tank, lo- under hood; other specifications the same as del 12. Model 14 is also furnished with a road- dy.

TAR MODEL 16 TOURING CAR. $4000.

Model 16, 7-passenger touring car, price $4000; ler, 4-cycle, vertical, water cooled, with fan, P. motor, suspended on sub-frame under hood; rs, 5-inch bore by 5½-inch stroke; mechanically d valves; nickle babbitt crank shaft bearings; cam shaft bearings; double jump spark igni- vith storage battery and Bosch magneto; me- l oiler; multiple (28) disc clutch; selective change speed gear, 4 speeds forward, direct on perated by one side lever and mounted in Tim- ler bearings; shaft drive; floating type rear d I-beam front axle; tires, 36 by 4½-inch in d 36 by 4-inch in front; ball wheel bearings; base, 122 inches; prest steel main and sub- semi-elliptic springs, 44 by 2 inches, 7 leaves, t, and 54 by 2 inches, 9 leaves, in the rear; nd sector steering gear; external and internal on hub; spark and throttle control on top of wheel; seats 7; 30-gallon gasoline tank under weight, 3000 lbs.; equipment: oil and gas generator, horn and tools. Also furnished with bout body.

Model 18, 5-passenger touring car, price $2500; ler, verticle, 4-cycle, water cooled with fan, P. motor, set in front under hood, on a sub- cylinders 4¼-inch bore by 5-inch stroke; nickle crank shaft bearings; bronze cam shaft bear-

Belden Gasoline Cars.

Made by the Belden Motor Car Co., Pittsburg, Pa.

BELDEN MODEL B 6-CYLINDER ROADSTER. $4700.

Belden Model B Roadster; seating capacity, 3; motor, 6 water-cooled, 4-cycle cylinders, 4⅝x5-inch, 40-60 H. P., motor under hood in the front, on three-point suspension; mechanical valves in the heads, operated by walking beams; special bronze crank and cam shaft bearings, lined with Parsons white metal; double ignition, jump spark, from storage battery and jump spark from Bosch magneto; splash lubrication; multiple disc clutch; selective sliding change speed gear, giving 4 speeds ahead and 1 reverse, direct on the third speed, accelerated tail shaft on the fourth; change speed mounted on F. & S. ball-bearings; shaft drive to floating type rear axle, front axle I-section drop-forged; 36x3½-inch front tires and 36x4-inch rear; wheel base, 120 inches; wheels on F. & S. ball-bearings; chrome nickel steel prest frame, no sub-frame; front springs semi-elliptic, 44 inches long, 2¼ inches wide, 5 leaves; rear springs, full elliptic, 39 inches long, 2¼ inches wide, 5 leaves, both top and bottom; irreversible adjustable screw-action steering gear; internal and external brakes on the rear wheel drums; spark position fixt, throttle on wheel and also accelerator pedal; 25-gallon gasoline tank, under front seat; complete weight, 2700 lbs.; equipment, acetylene headlights, Prest-O-Lite tanks, electric side and tail lights, tools, mats, etc.; price, $4700. Special features: straight line drive, low centre of gravity, with large clearance.

BELDEN MODEL A 6-CYLINDER TOURING CAR. $4800.

Belden Model A 6-cylinder touring car; light touring body; passenger capacity, 5; motor, 6 cylinders, 4⅝x5-inch, 40-60 H. P., water-cooled, under hood in the front, on three-point suspension; mechanically operated valves in the head; bronze Parsons white metal-lined crank and cam shaft bearings; double ignition, jump spark, by storage and Bosch magneto; splash lubrication; multiple disc clutch; selective 4-speed sliding change gear on F. & S. bearings, direct on third speed, operated by hand lever; shaft drive to floating rear axle; front axle I-section, drop-forged; 36x4-inch front tires, 36x5-inch rear tires; 127-inch wheel base; wheels on F. & S. ball-bearing; chrome nickel steel frame, no sub-frame; semi-elliptic front springs, 44 inches long, 2¼ inches wide, 6 leaves; full elliptic rear springs, 39 inches long, 2¼ inches wide, 6 leaves in each half; irreversible and adjustable screw-action steering gear; brakes, external and internal on rear hubs; throttle on wheel, also foot accelerator; fixt spark; 25-gallon gasoline tank, under the front seat; weight complete, 2800 lbs.; equipment, same as Model P; price, with touring body, $4800; limousine or landaulette, $6000.

Hosted by Google

front on main frame; marine type die cast babbitt crank shaft bearings; imported annular ball cam shaft bearings; jump spark ignition, with dry cells and La Coste magneto; splash and pressure feed lubrication; leather faced cone clutch; sliding transmission change speed gear; 3 speeds forward and 1 reverse, direct on high; operated by one side lever and mounted on marine type die cast babbitt bearings; shaft drive; live rear axle on Timken roller bearings; tubular front axle; 103-inch wheel base;

MORA TOURER FOUR, 5-PASSENGER. $2500.

Timken roller wheel bearings; 4 by 32-inch tires; armored wood frame; transverse semi-elliptic springs, 40½-inch by 2½-inch, 7 leaves, in front, and platform springs in the rear, 43 by 2-inch, 6 leaves, on sile, 35½ by 2-inch, 4 leaves on end; screw and nut steering gear; two external contricting brakes operated by foot pedal, and two internal expanding brakes operated by emergency hand brake lever, on rear hubs; throttle and spark with stationary segment; seats 5; 13½-gallon gasoline tank under front seat; weight 1900 lbs.; equipment: 2 searchlights and generator, 2 side lamps and tail lamp, full set of tools; special feature, aluminum pan cast integral with lower half of engine case.

MORA RACYTYPE FOUR, 3-PASSENGER. $2350.

Mora Racytype Four, 3-passenger runabout; price $2350; tires 32 by 3½-inch; wheel base 98 inches; 15-gallon gasoline tank under front seat; weight 1750 lbs.; all other specifications the same as for the 4-cylinder touring car.

MORA TOURER SIX, 5-PASSENGER. $3600.

Mora "Tourer" Six, 5-passenger; 6-cylinder, vertical, water cooled, 42-50 H. P. touring car; cylinders 4-inch by 5½-inch stroke; motor hung under hood on main frame; mechanically operated valves; crank and cam shaft bearings of annular imported ball type; high tension ignition, by storage battery and high tension magneto; splash lubrication; inverted leather faced cone clutch, with cork inserts; selective change speed gears; 3 speeds forward and 1 reverse, direct on third, operated by side lever, and mounted in F. & S., imported ball bearings; double universal shaft drive; floating rear axle and I-beam front axle;

nal brakes on rear hubs, operated by foot
side lever; throttle and spark levers abov
with stationary segment; 18-gallon gasoline ta
front seat; weight 2500 lbs.; equipment in
searchlights and generator, 2 side lamps, t
and set of tools.

Mora "Racytype" Six, runabout, $3500; 36
inch tires; 105-inch wheel base; semi-elliptic
in front, 41 by 2-inch, 10 leaves, 2 auxili
platform spring in the rear, 43¼ by 2-inch,
and 2 auxiliary on the sides, and 38 by
leaves, and 2 auxiliary in the rear; weight 2
16-gallon gasoline tank under seat; other
tions and equipment same as for the 6-cylin
ing car. 1908 cars described in our Novemb
issue, page 72.

Stilson Gasoline Cars.

Made by the Stilson Motor Car Co., Pittsfiel

ERSON MODEL K. TOURING CAR, $4200.

son Model K. 7-passenger touring car; price, 4-cylinder, vertical, water-cooled, 50-55 H. P., motor, set under hood, on four-point suspen- ylinders 5½-inch bore, 5-inch stroke; mechanical ction; crank shaft in bronze cup Babbitt bear- m shaft in Babbitt bearings; double ignition by storage and magneto; mechanical lubrica- ontracting band clutch; selective sliding change gear, 4 speeds forward, direct on high, operated lever; ball-bearings in change speed gear; side drive; drop-forged solid axles, front and rear; 36x4 inches in front, 36x4½ inches in rear; wheel bearings; wheel base, 114 inches; main of chrome knickle steel; springs semi-elliptic nd rear, 40 inches long; wheel and worm irre- e type steering gear; contracting brakes on heel drums and contracting brakes on jack operated by side lever to wheel drums and by ever on jack shaft; gasoline capacity, 15 gal- ank located under driver's seat; equipment, fold- p, trunk rack, robe rail, foot rest, tire car- lamps and generator; weight complete, 3400 This model is also furnished with a runabout t $4000.

APPERSON "JACKRABBIT," $5000.

erson "Jackrabbit;" seats 2; 4 cylinders, 4-cycle, -cooled, 55 H. P., vertical motor, under hood, ur-point suspension; cylinders 5½-inch bore by stroke; mechanical valve action; bronze cup tt crank shaft bearings; plain Babbitt cam shaft gs; double ignition system, storage battery and eto; mechanical lubrication; contracting band ; sliding selective change speed gear, 4 speeds, on high, ball-bearing, operated by side lever; e chain drive; I-section front and rear axles; base, 105 inches; tires, 34x4 inches in front 4x4½ inches in rear; ball wheel bearings; chrome steel frame; front springs, semi-elliptic, 34x1¾ s; rear, semi-elliptic, 38x1¾ inches; worm and irreversible type steering gear; brakes internal external on rear hub drums; 24 gallons gasoline ity; tank located in back of seats; weight, 2200 equipment; 5 lamps and generator. Price, .

APPERSON MODEL M ROADSTER, $2750.

person Model M, 4-passenger roadster; 4 cylinders, nch bore by 5-inch stroke, 35 H. P. motor; shaft e; floating type rear axle, drop-forged front axle; 34x4 inches; wheel base, 106½ inches; prest steel e; springs semi-elliptic front and rear, 40x2 inch- 7 leaves, in front, and 48x2¼ inches, 7 leaves, in ; internal and external brakes on rear hub drums, ated by side and foot lever; weight, 2400 lbs.; pment; 5 lamps, generator, tire carriers. All r specifications are the same as for Model S, 7- enger touring car. Price, $2750. Model S chassis

versible type steering gear; brakes or rear hubs and on jack shaft; foot lever and side lever control; gaso- line capacity, 15 gallons, tank under front seat; weight, 3475 lbs.; equipment: top, trunk rack, 7 lamps, generator, etc. Price, $5000.

Kiblinger Gasoline Vehicles.

Made by W. H. Kiblinger Co., Auburn, Ind.

Kiblinger Model H, 2-passenger car, piano box body; 2-cylinder, opposed, air-cooled motor, 12 H. P., 4⅛ by 3¾, located on the left side of the chassis, hung from angle iron cross members under the body; me- chanical valves in the head; jump spark ignition from dry cells; forced sight feed lubrication; planetary change speed gear, fibre faced clutch for the high, 2 speeds forward and 1 reverse, operated by hand lever; drive to rear wheels by double chains; solid axles, 1⅛ inches; 69½-inch wheel base; high wheels, fitted with 1¼-inch solid rubber tires; wheels fitted

KIBLINGER MODEL H 2-PASSENGER VEHICLE $450.

with plain or roller bearings as ordered; 2-inch angl iron frame; 36 by 1½-inch elliptic springs, 5 leaves wheel steering, with spark and throttle control o the post; contracting brakes on the rear wheel hub 5-gallon gasoline tank under the seat; weight, com plete, 800 lbs.; price, with leather dash, storm apro brass hub bands, brass seat handles, and set of tool $450. Described in our September, 1907, issue, pa 106.

Auburn Gasoline Cars.

Made by the Auburn Automobile Co., Auburn, In

AUBURN MODEL G TOURING CAR, PRICE $13

Model G Touring Car; price, $1350; 2-cylinder, h zontal, 24 H. P., water-cooled motor, located un body and suspended on angle steel, sub-frame; cy ders, 5¼-inch bore by 5-inch stroke; mechanical va action; crank shaft and cam shaft in Babbitt be ings; jump spark ignition, by dry cells; mechani force feed lubrication; cone clutch; planetary cha speed gear, 2 speeds forward and 1 reverse, di on high, operated by foot pedal and lever; bro bearings in change speed gear; center chain dri roller bearings in rear axle and ball-bearings in

ATLAS MODEL D. T. TOURING CAR. $2000.

Atlas Model D. T. Touring Car; 3-cylinder, vertical, 2-cycle, motor 4½x4½, 34 H. P., water-cooled by thermal circulation; no valves or cam shafts; hardened steel and bronze bushings; crank shaft bearing surfaces; jump spark ignition from dry battery; force feed oiler; 3 speed forward and reverse sliding change speed gear, cone clutch, or planetary change speed gear of Atlas make, giving 2 forward speeds and reverse, with multiple disc clutch, can be had; shaft drive to live rear axle; tubular front axle; 106-inch wheel base; 34-inch wheels, on roller bearings; 3½-inch tires; wood frame, angle steel sub-frame; ¾-elliptic springs front and rear; front, 40x1¾ inches, 6 leaves, and rear, 48x1¾ inches, 7 leaves; worm and gear steering, irreversible; internal expanding brakes on rear wheels and brake on engine; spark and throttle on steering wheel; 18-gallon gasoline tank, under front seat; capacity, 4 persons; weight complete, 2200 lbs.; equipment, side lamps, tail light, horn, tool kit, jack, oiler and headlight brackets; price, $2000.

ATLAS TWO-CYCLE MODEL E TOURING CAR. $2400.

Atlas Two-Cycle Model E Touring Car; 4-cylinder, vertical, 2-cycle, 4½x4½, 46 H. P. motor, water-cooled by thermal circulation, motor under hood on sub-frame; bronze bushed crank shaft bearings; jump spark ignition from dry batteries; forced feed lubrication; cone clutch; 3 speeds forward and 1 reverse, sliding change gear, operated by foot lever; shaft drive to live rear axle; front axle I-section; 114-inch wheel base; 34-inch wheels, on roller bearings; 4-inch tires on Quick Detachable rims; prest steel frame, angle steel sub-frame; ¾-elliptic springs front and rear; front, 40x2 inches, 7 leaves, and rear, 52x2 inches, 8 leaves; worm and gear irreversible steering; expanding bands on rear wheels and band brake on engine; spark and throttle control on steering wheel; 20-gallon gasoline tank under the front seat; passenger capacity, 5; weight complete, 2400 lbs.; equipment, headlights, 2 side lights, tail light, horn, tool kit, jack and oiler; price, $2400. Special features: valveless, gearless engine, aluminum body.

ATLAS MODEL R TWO-CYCLE RUNABOUT. $1400.

Atlas Model R Two-Cycle Runabout; 2-cylinder, vertical, 2-cycle, 4½x4½, 22 H. P. motor, water-cooled by thermal circulation; motor under the hood, on sub-frame angles; bronze bushed crank shaft bearings; jump spark ignition from dry cells; force feed lubrication; 3 speed and 1 reverse planetary change gear; multiple disc clutch on the high speed, operated by hand lever; shaft drive to live rear axle, tubular front axle; 90-inch wheel base; 30-inch wheels, on roller bearings; 3-inch tires on Quick Detachable rims; white, cab

ATLAS TWO-CYCLE MODEL D RUMBLE-SEATED RUNABOUT. $1800 OR $1900 (According to Change Speed Gear).

Atlas Two-Cycle Model D Rumble-Seated Runabout; 3-cylinder, 2-cycle, 34 H. P. motor; general specifications similar to Model D. T.; double rumble seat; weight complete, 2000 lbs.

ATLAS TWO-CYCLE TAXICAB OR TOWN CAR. $2600.

Atlas Two-cycle Taxicab or Town Car; same general specifications as the Model R runabout, with the exception of the special enclosed body; price, $2600. See models described December, 1907, page 104.

Elmore 2-Cycle Gasoline Cars.

Made by the Elmore Mfg. Co., Clyde, O.

TWO-CYCLE ELMORE MODEL 40. $2500.

Elmore Model 40, 2-cycle gasoline touring car, 2-cylinder, vertical motor, under the hood at the front, water-cooled, 4½x4-inch, 35 H. P., mounted on sub-frame; no valves; Babbitt crank shaft bearings; ignition by Atwater-Kent generator from dry battery; mechanical lubrication; expanding ring clutch; selective sliding change speed gear on roller bearings, giving 3 forward speeds and 1 reverse, direct on high; shaft and bevel gear drive to live rear axle; front axle I-section; 109-inch wheel base; 34-inch wheels, on roller bearings, front on ball-bearings; 4-inch tires, front and rear; semi-elliptic front springs, platform rear; prest steel frame and sub-frame; steering gear adjustable worm and gear; internal and external brakes on rear wheels; spark and throttle on steering wheel; 20-gallon gasoline tank, under seat; weight complete, 2550 lbs.; passenger capacity, 5; equipment, 5 lights and tools. Price, $2500. Special features, valveless 2-cycle motor and new ignition system, giving increased mileage with dry cells.

g wheel: 15-gallon gasoline tank under front complete weight as a runabout, 2050 lbs.; as a car, 2150; passenger capacity, 5; special fea- valveless 2-cycle engine and Atwater-Kent ig- equipment, 5 lights and tools. Price, $1750.

Euclid 2-Cycle Gasoline Cars.

by the Euclid Motor Car Co., Cleveland, Ohio.

id 2-cycle roadster, with runabout body, with g capacity for 2 or 3 persons; motor, 3 air- 2-cycle cylinders, 3⅜x3½-inch, 20 H P., lo- on the sub-frame, under the hood; air-cooled haust fan and casing; combination bronze and t crank shaft bearings; jump spark ignition by e cells; mechanical lubrication by multiple force ubricator; friction change speed mounted on bearings, operated by side lever and giving all forward and back; double chain drive to live xle, front axle tubular; 100-inch wheel base; 30- vheels, on Timken roller bearings, fitted with h tires; frame and sub-frame of tubular type; springs, full elliptic, 40x1¾ inches, 5 leaves; prings, half-elliptic and platform, 40x1¾ inches.

HE EUCLID 2-CYCLE ROADSTER, $850.

es; wheel steer; internal expanding brakes on ar wheels; spark and throttle control on top of g wheel; 10-gallon gasoline tank, under bonnet r of engine; weight complete, 1350 lbs.; equip- 2 side oil lamps, tail light, 2 gas head lights. $850. Special features: valveless 2-cycle en- direct feed of mixture to cylinders by tandem pistons.

Euclid 2-cycle Light Tourer; passenger capacity, cylinder, 2-cycle, air-cooled motor, 35 H. P.; nent and general specifications similar to the Roadster; $1000.

Marmon Gasoline Cars.

by the Nordyke & Marmon Co., Indianapolis, Ind.

ARMON MODEL G TOURING CAR, $3000.

mon Model G, 5-passenger touring car; 4-cylin- 90-degree angle, air-cooled motor, 5x4½ inches, H. P., located in the front, on a sub-triangular , having 3-point suspension; valves operated by bar and push rods in the cylinder heads; crank bearings, Parson's white brass, cam shaft the jump spark ignition from storage and dry cells; on automatic force feed lubrication; disc clutch cork inserts; selectively operated, 3 speeds and e, change speed gear, on annular ball-bearings, on the high; shaft drive to floating rear axles; axles, I-section; 104-inch wheel base; 34-inch s, on annular ball-bearings on the front; conical bearings at the rear; 4½-inch rear tires and 4- front tires, quick detachable; prest steel frame ub-frame; full elliptic springs, front and rear; 40x2 inches, 5 leaves, and rear, 42x2 inches, 6 ; screw and nut irreversible steering gear; 2 , internal expanding on each rear wheel; con- spark and throttle on steering wheel; 20-gallon e tank, on the front seat; passenger capacity, of quick detachable type; prest steel frame and su

MARMON MODEL H TOURING CAR, $3500.

frame; full elliptic front springs, 40x2 inches, leaves; full elliptic rear springs, 42x2 inches, leaves; steering gear, irreversible screw and nut type brakes, internal and external on rear wheel drum control, spark and throttle on steering wheel, foo accelerated; 20-gallon gasoline tank, under seat, ai pressure feed; complete weight, 3250 lbs.; passenge capacity, 5 to 7; equipment, 2 gas, 3 oil lamps, horn tools, jack, shock absorbers; price, $3500. Specia features; same as other cars.

MARMON MODEL H ROADSTER, $3500.

Marmon Model H Roadster; 4-cylinder, vertical water-cooled, 5x5, 45-50 H. P. motor, under the hoo at the front, on a sub-frame, having 3-point suspen sion; valves on opposite sides, operated by rods wit direct vertical lift; crank shaft and cam shaft bea ings, Parson's white brass; jump spark ignition fro storage battery and magneto; Marmon automatic forc feed oiler; multiple disc, cork inserted clutch; 3 speed and 1 reverse, selective sliding change speed gea on annular ball-bearings, direct on the third; shaf drive to floating rear axles; front axle I-section; whee base, 114 inches; 34-inch wheels, on conical rolle bearings; 4-inch front and 4½-inch rear, quick de tachable tires; prest steel frame and sub-frame; ful elliptic springs, 40x2 inches, 6 leaves, front; rear, ful elliptic, 42x2 inches, 5 leaves; screw and nut irre versible steering gear; brakes, internal and externa on rear wheels; control, spark and throttle on whee and also foot accelerator; 20-gallon gasoline tank, o the front seat, under air pressure; weight complete 2900 lbs.; equipment, 2 gas lamps, 3 oil lamps, horn tools, jack and shock absorbers; price, $3500.

International Gasoline Auto Buggies.

Made by the International Harvester Co., 7 Monro St., Chicago, Ill.

INTERNATIONAL AUTO BUGGY, MODEL A.

International 2-seated surrey; 2-cylinder, horizonta opposed, air-cooled by double fan motor, 5 by 5, 1 H. P., located under the body on steel sub-frame mechanical valves in cylinder heads; crank shaft an cam shaft bearings of bronze; ignition, jump spar from 6 dry cells; lubrication, mechanical; externa band clutch; change speed gear by positive clutche mounted on plain bearings, giving 2 forward and reverse speed, direct on high, operated by lever; dri

FRANKLIN MODEL G TOURING CAR. $1850.

Franklin Model G touring car, price $1850; 4-cylinder, air cooled, vertical, 16 H. P. motor, in front, suspended on angle irons to sills; cylinder 3¼-inch bore and stroke; mechanical valve action; die cast babbitt crank shaft and cam shaft bearings; jump spark ig-

MOLINE MODEL A TOURING CAR. $2500.

Moline Model A touring car, price $2500; 4-cylinder, -cycle, vertical, water cooled, 35 H. P., 4½-inch bore y 5-inch stroke, suspended in front under hood, on our point suspension; mechanically operated vales, ll on one side; babbitt crank shaft bearings; bronze am shaft bearings; jump spark ignition by storage attery; force feed lubrication; cone clutch; progres-ive type change speed gear, 4 speeds direct on high peed, operated by hand lever, and mounted in babbitt earings; shaft drive; tubular front and rear axle; 4 by 4-inch tires; wheel bearings, ball in front and oller in rear; wheel base, 110 inches; prest steel hannel frame; half elliptic springs, 46 by 2½ inches, 0 leaves, in front, and full elliptic, 38 by 2-inch, 6 eaves, rear; irreversible screw and nut wheel steer-ng; external and internal brakes on rear hubs; seats ; 18-gallon gasoline tank under front seat; weight, 650 lbs.; equipment: gas lamps, dash lights, tail ght, tube horn, tool and tire kit.

MOLINE MODEL H TOURING CAR. $1250.

Moline Model H, 5-passenger touring car, price $1250; cylinder opposed, horizontal, water cooled, 5 by 5; 0 H. P. motor, located under body, and suspended on our-point suspension direct to frame; mechanically perated valves; babbitt crank shaft bearings; bronze am shaft bearings; jump spark ignition by storage atteries; force feed lubrication; 3-speed planetary ransmission, direct on high operated by hand lever; hain drive; divided tubular rear and tubular front axle; 0 by 3½-inch tires; wheel bearings, ball in front and oller in the rear; 96-inch wheel base; prest steel chan-el frame; half elliptic, 44 by 1¾-inch springs, nine aves, in front, and full elliptic, 42½ by 1¾-inch, 5 aves in the rear; irreversible screw and nut steer-g; double-acting Raymond brakes on rear hubs; seats ; 14-gallon gasoline tank under hood; weight, 1800 ounds; equipment: gas lamps, dash lights, tail ghts; tube horn, tool and tire kit.

MOLINE MODEL S TOURING CAR. $2000.

Moline Model S, 5-passenger touring car, $2000; 4-linder, 4-cycle, vertical, water cooled, 3⅞-inch bore 4½-inch stroke; 24 horse power motor, set in front nder hood on four-point suspension, mechanically perated valves; babbitt crank shaft bearings; bronze m shaft and bearings; 4-speed, progressive type hange speed gear, direct on high, operated by hand ver, and mounted in babbitt bearings; shaft drive; vided rear axle and tubular front axle; 32 by 3½-inch heels; wheel bearings, ball in front and rollers

ALBANY SURREY, MODEL G.

Albany Surrey, Model G; 2-cylinder, 18-20 H air-cooled, horizontal, opposed motor, under cylinder 5-inch bore and stroke; motor is suspend lugs on cylinder heads; mechanical valve a crank shaft and cam shaft bearings of bronze; spark ignition by dry battery; six-feed mech oiler; friction drive by friction wheel and di bronze bearings; friction wheel operated by lever; drive by 1½-inch Diamond roller chain; 1⅛x34-inch solid Diamond side wire; roller

ALBANY MODEL F RUNABOUT.

bearings; wheel base 96 inches; frame 2-inch steel; sub-frame of heavy tire steel; full elliptic and rear springs, 36x1¼ inches, 4 leaves, fron rear; wheel steering with direct ball and socket to take up all lost motion; drop-forged knuckle pansion brakes on rear wheels; spark lever on and gas control by foot pressure; capacity, 4 or sons; gasoline capacity, 9 gallons; tank located seat; weight, 1500 lbs. This chassis is also fur with runabout body, known as Model F, seat persons; weight, 1400 lbs. An equipment consist top, storm front, lamps, horn and tools is fur at $75 extra for the Surrey, and at $50 extra f Runabout. Albany Runabout described in our Oc 1907, issue, page 96.

Schacht Gasoline Car.

Made by the Schacht Mfg. Co., Cincinnati,

SCHACHT MODEL K. PRICE, $680.

Schacht Model K; Corning type body; 2-cyl horizontal, water-cooled, 4-cycle, 4 by 4, 12 H. P tor in rear suspended on sills of body; crank and cam shaft bearings; Parson's white metal; spark ignition from dry cells; mechanical sight lubrication; friction transmission; Timken roller

BUGMOBILE MODEL A. $500.

gmobile Model A runabout; motor, 2 cylinders, sed, horizontal, air-cooled, under the centre of body, bore and stroke 4 inches, 12 H. P.; me- ical valves, located on the upper side; anti-fric- metal crank shaft and cam shaft bearings; igni- jump spark from dry battery; force feed lubri- n; 2 speed and 1 reverse, special Bugmobile ge gear with finger clutch, operated by lever on steering post; lubricated chain cable; axles, 1⅛

MOBILE MODEL A, WITH SURREY SEAT.

s; 68-inch wheel base; wheels on plain bear- and fitted with 1¼-inch solid tires; 2-inch angle frame; full elliptic springs front and rear, 1½ s wide, with 4 leaves; left side lever steering; s applied to outside of rear wheel sheaves; spark throttle on steering post; cable tension controlled ot levers moving the rear axle; 6-gallon gasoline under the seat; carrying capacity, 2; complete veighs 950 lbs.; equipment includes extra surrey without top, lamps or fenders. Price, $500. Spe- feature: automatic differential without gears.

IODEL B BUGMOBILE RUNABOUT, $750.

el B Bugmobile runabout; stanhope body, with

rear axle by foot lever; 10-gallon gasoline tank, un hood; weight complete, 1250 lbs.; equipment, f leather Victoria top, 2 acetylene lamps in bla enamel. Price, $750. Special feature: automatic d ferential without gears.

Brush Gasoline Cars.

Made by the Brush Runabout Co., Detroit, Mich.

BRUSH MODEL 1 A RUNABOUT. $500-$550.

Brush Model 1 A Runabout, piano box body; mot 1 vertical, water-cooled, cylinder, 4-cycle, 4x4, 6 H. P water-cooled by thermal circulation under the ho at the front, mounted on three-point suspension; valv mechanically operated, located on the side; Babbi crankshaft bearings; ignition jump spark, from d cells; lubrication from crank case compression; mets to-metal cone clutch; internal planetary change spe gear, on ball-bearings, giving 2 forward and 1 rever speed, direct on high, operated by a single ha lever; drive is bevel gear to countershaft and si chains to the rear wheels; front and rear axles wood, reinforced; wheel base, 84 inches; trust wo frame; 32x2-inch solid tires, or 28x3-inch pneumat tires; wheels on ball-bearings; spiral springs of speci vertical type used in front and rear; steering by e cyclic internal gearing, which moves slowly fro straight ahead position, but accelerates as it turn internal expanding brakes in the rear wheel sprock drum, acting equally in either direction; seating c pacity, 2; weight complete, 900 lbs.; 4-gallon gasoli tank, under the floor; equipment, mat and tools onl price, $500-$550. Described in our December, 190 issue, page 75.

Jewel Gasoline Cars.

Made by the Forest City Motor Car Co., Massillon,

JEWEL MODEL 40 TOURING CAR. $3000.

Jewel Model 40 touring car, price $3000; 4-cylinde 4-cycle, vertical, water cooled, 40 H. P. motor front under hood, suspended on sub-frame; cylinde 4¾-inch bore by 5-inch stroke, mechanically operat valves; prest nickel babbitt crank and cam sha bearings; jump spark ignition by storage battery a Bosch magneto; double system of lubrication; c pump in crank case and 6 feed mechanical oiler; co insert, cone clutch; selective change speed gear, thr forward speeds and reverse, direct on high, operated

Digitized by Google

also furnished with roadster and limousine bodies.

JEWEL MODEL D RUNABOUT. $500.

ewel Model D runabout, price $500; body of piano type; single-cylinder, 2-cycle, horizontal, water led, 10 H. P. motor, placed in rear of chassis, ted to sub-frame, cylinder, 4½-inch bore by 4-inch oke; jump spark ignition by dry cells, automatic r-feed oiler; high speed disc type clutch; planetary nge speed gear, 2 speeds forward and one reverse, ect on high, operated by hand lever and running bronze bearings; chain drive; live rear axle with t steel I-section frame and I-beam cast steel front e; tires, 28 by 3-inch; wheel bearings, nickle bab-

JEWEL MODEL E STANHOPE. $750.

t rear and bronze in front; wheel base, 70 inches gle steel main and sub-frame; full elliptic springs nt and rear, 1⅜-inch wide in front, and 1¼-inch rear; rack and pinion wheel steer; one brake on r axle; seats 2; 5-gallon gasoline tank under seat; ipment; lamps, horn and tools; weight, 950 lbs. nplete. This Model B runabout chassis is also fur-hed with a Stanhope body, known as Model E; ight, 1050 lbs.; price $750.

Holsman Gasoline Automobiles.

de by the Holsman Automobile Co., Chicago, Ill.

rect on high and low, operated by single lever; by Holsman patent steel cable; tires, 1 1-8-inch s rubber; wheels, 44-inch front and 48-inch rear, Timken roller bearings; 65-inch wheel base; s frame; full elliptic springs, front and rear; stee by lever; four brakes operated by hand lever; five lon gasoline tank in seat back; weight complete pounds, without top; equipment, tools and lan Price, $650 without top. Special features; one trol lever for all speeds forward and reverse.

HOLSMAN MODEL 9. $700, WITHOUT TOP.

Holsman Model 9 runabout, 32x77-inch body; s 2 people; 2-cylinder, horizontal, opposed, air-co motor, 4x4, 12 4-5 H. P., located under the body steel tubing; automatic intake; crank shaft ni babbitt bearings, cam shaft phosphor bronze beari jump spark ignition from dry batteries; force lubrication; positive lug clutch; change speed of sliding type for high and low; variable speeds to 30 miles, 4 reverse, direct on high and low, erated by one lever; drive by Holsman patent s cables to the rear wheel sheaves; 1 1-8-inch, s rubber tires; wheel base, 75-inch, wheels, 44-front and 48-inch rear, on Timken roller beari steel frame; full elliptic springs; lever steering brakes operated by one hand lever; 5-gallon gaso tank in seat back; weight complete, 930 pounds, w out top; equipment: tools and lamps; price $700 w out top; special features; one control lever for speeds, forward and reverse.

HOLSMAN MODEL 10 RUNABOUT. $750.

Holsman Model 10 runabout, 32x77-inch body; eral specifications the same as Model 9; price plete without top, $750.

LIABLE DAYTON SURREY, MODEL F. $925.

eliable Dayton Surrey, Model F, price $925; 2-inder, water cooled, horizontal, 4-cycle, 4⅜-inch bore 4-inch stroke, 15 H. P. motor, located under hood l set crosswise of frame in front; mechanically rated valves by push rods; Parsons white brass nk shaft bearings; phosphor bronze cam shaft bear-s; jump spark ignition by dry cells; mechanical rication; external contracting clutch; sliding nge speed gear; 2 speeds forward and 1 reverse ling change gear, direct on high, operated by lev-on steering column, mounted in Hyatt roller bear-s; double chain drive; solid square front and r axles; tires, 40 by 1½-inch front and 44 by 1½-

LIABLE DAYTON COUPE SPECIAL, MODEL E. $1200.

h rear, solid; Timken roller wheel bearings; 103-h wheel base; wood frame; half elliptic springs, by 1½-inch, 5 leaves, in front, and full elliptics, by 1½-inch, 6 leaves, in rear; rack and pinion ering gear; internal expanding brakes on rear eels; spark and throttle levers on steering post; lal operated clutch and brakes; seats 4; 10-gallon oline tank under seat; weight, 1600 lbs.; equip-nt; 3 oil lamps, mats and tools; special feature; de-hable box for light delivery purposes to go in place rear seat.

LIABLE DAYTON RUNABOUT, MODEL E. $780.

eliable Dayton Runabout, Model E, price $780; gle seat runabout body for 2 passengers; 84-inch eel base; springs, 5 leaves front and rear; weight, 0 lbs.; other specifications same as for Model F rey. Runabout Model E chassis is also furnished h a special coupe body Model E for $1200; weight, 0 lbs. 1908 models described in our November, 7, issue, page 67.

Regal Gasoline Cars.

lade by the Regal Motor Car Co., Detroit Mich.

egal 5-passenger touring car, $1250; **4-cylinder**, ycle, water-cooled, vertical, 4-inch bore by **4¼-inch** ke, 25 H. P. motor, under hood on arms to frame;

REGAL 5-PASSENGER TOURING CAR. $1250

steel frame, semi-elliptic springs in front, 38x2 inc 6 leaves and full elliptic 36x2-inch, 6 leaves rear; worm and gear type steering gear; internal external band brakes on rear wheels; 15-gallon g line tank under seat; weight, 1900 pounds; equipm

REGAL 3-PASSENGER RUNABOUT. $1250.

tools, side oil and tail lamps and horn. Speci tions for the runabout are same as for the t ing car, with the following exceptions: Seats, springs, 5 leaves front and rear; weight, 1750 pou The touring car chassis is also furnished with icab and delivery bodies.

Mier Gasoline Cars.

Made by the Mier Carriage and Buggy Co., Ligo Ind.

MIER MODEL A RUNABOUT. $575.00

Mier Model A Runabout; torpedo stern; price $57 2-cylinder, vertical, water cooled, 4-cycle, 4-inch and stroke, 10 to 12 H. P. motor, located under in front, suspended on four full ellliptic springs; tomatic intake valves; Parsons white bronze c shaft bearings, bronze cam shaft bearings; jump s ignition, by 6 dry cells; pressure lubrication; tion clutch; friction transmission, operated by lever, and mounted in Parsons white bronze; do side chain drive; solid axle front and rear; 1½

MIER MODEL B RUNABOUT. $575.00

BUICK RUNABOUT, MODEL 10, $900.

Buick Runabout, Model 10; price, $900; 4-cylinder, rtical, 4-cycle, water-cooled, bore and stroke 3¾ ches, 18 H. P. motor, set under hood, on sub-ame; mechanical valve action; valves operated from e cam shaft; plain crank and cam shaft bearings; mp spark ignition; storage and dry batteries; me-anical force feed lubrication; cone clutch; plane-ry change speed gear, 2 forward speeds and 1 verse, direct on high, operated by side lever and ot pedals, and mounted in plain bearings; shaft ive to divided rear axle; tubular front axle; tires, x3 inches; ball-bearings in front wheels, Hyatt ller bearings in rear; 88-inch wheel base; prest steel ain and sub-frame; half-elliptic springs, 36x1½ inch-, 5 leaves, in front, and full elliptic springs, 37½x ¼ inches, 4 leaves, in rear; irreversible steering ar; external contracting brakes on drive shaft and ternal expanding brakes on rear hubs; spark and rottle levers on top of steering wheel, on sta-onary sector; seats 3; 11-gallon gasoline tank, on ont seat; weight, 1500 lbs.; equipment, tools, repair tfit, 2 headlights, 2 oil lamps, generator, tail lamp. rn. Described January, 1908 issue, page 186.

BUICK TOURING CAR, MODEL 5, $2500.

Buick Model 5, 5-passenger touring car; price, 500; 4-cylinder, vertical, water-cooled, 4-cycle, 4⅝-ch bore, 5-inch stroke, 40 H. P. motor, set under od, on sub-frame; superior babbitt crank and cam aft bearings, jump spark ignition, from storage attery and magneto; positive valveless system of brication; cone clutch; selective sliding change eed gear, 3 speeds forward and 1 reverse, direct on ird, operated by side lever, mounted on roller bear-gs; shaft drive; semi-floating rear axle and I-beam ont axle; 34x4-inch tires; Timken roller wheel bear-gs; 108-inch wheel base; prest steel main and sub-ame; semi-elliptic springs front and rear, 40x2 ches, 7 leaves, in front, and 50x2¼ inches, 8 leaves, rear; irreversible steering gear; external con-acting brakes on drive shaft; internal expanding on ar wheels; spark and throttle control on top of eering wheel; 18-gallon gasoline tank, under front at; weight complete, 2500 lbs.; equipment, 2 gas mps, 2 oil side lamps, 1 tail lamp, horn, generator, ols and tire repair outfit.

BUICK TOURING CAR, MODEL D, $2000.

ary sector; 16-gallon gasoline tank, under front equipment, tool repair outfits, gas headlights, oil lamps, tail lamp, horn and generator.

BUICK RUNABOUT, MODEL S, $2000.

Buick Model S has the same specifications as M D touring car, with the exceptions of the wheel which is 106 inches; either single or double ru seat is furnished; double rumble seat, $50 e price of Model S, $2000.

BUICK TOURING CAR, MODEL F, $125

Buick Model F Touring Car; seats 5; price, $ 2-cylinder, horizontal, 4-cycle, water-cooled, 4¼ bore, 5-inch stroke, 22 H. P. motor, under suspended from cross members; babbitt metal and cam shaft bearings; jump spark ignition; st and dry cells; mechanical force feed lubrication; clutch; planetary change speed gear, 2 forward s and 1 reverse, direct on high, operated by foot p and side hand lever, mounted in plain bearings; drive; divided rear axle, tubular front axle; inch tires; Timken roller front wheel bearings Hyatt roller rear wheel bearings; 92-inch wheel angle iron frame; ¾ elliptic springs, 37x1¾ inch leaves, in front, and full elliptic, 44x1¾ inch leaves, in rear; pinion and sector steering gear ternal expanding hub brakes; control details; pedals for slow speed, reverse, and brake; spark throttle levers on top of steering wheel; stati sector; 15-gallon gasoline tank, under hood; ment, full repair and toll outfit, 2 gas headligh oil lamps, 1 tail lamp, horn and generator.

BUICK RUNABOUT, MODEL J, $1150.

Buick Model G Runabout, turtle back; price, $ tires, 30x3½ inches; springs, 7 leaves in rear; al er specifications same as for Model F touring

Speedwell Gasoline Cars.

Made by the Speedwell Motor Car Co., Dayton,

Speedwell Model C roadster; 4-cylinder, ver

SPEEDWELL MODEL C, $2500.

ar; brakes, internal and external on rear wheels; and throttle on steering wheel; auxiliary foot le; 21-gallon gasoline tank under seat; 2 or 3 pas-s; equipment: full set of lamps, generator, tools, etc.; price, $500.

SPEEDWELL MODEL B. PRICE, $4250.

dwell Model B touring car; 6-cylinder, vertical, cooled, 4½ by 5, 60 H. P. motor, on sub-frame the hood; Parson's white brass crank shaft gs, bronze cam shaft bearings; jump spark ig-from storage batteries and magneto optional; le force-feed lubrication; cone clutch; 3-speed reverse sliding change gear on roller bearings, on the high; shaft drive to floating rear axle, axle I-section; 132-inch wheel base; 36-inch on ball bearings; 4-inch front tires and 4½-ar tires; prest steel frame and sub-frame; semi-front springs, 44 by 2¼, 10 leaves, full ellip-ar springs, same dimensions; worm and seg-steering gear; internal and external brakes on heels; spark and throttle on steering wheel; ry foot throttle; 21-gallon gasoline tank under eat; passenger capacity 7; equipment: full set ps, generator, tools, jack, etc. Price, $4250.

dwell Model A Roadster; same general specifica-s the Model B touring car, except lighter rear are used and the body seats 3 or 4 passen-price, $4250.

dwell Model D touring car; same general chas-ecifications as Model C roadster; seats 5 per-price, $2500. Speedwell Model E limousine same chassis, price, $3500.

Dorris Gasoline Cars.

by the Dorris Motor Car Co., St. Louis, Mo.

DORRIS MODEL C, $2500.

s Model C tonneau car; 4-cylinder, vertical, ooled, 4-cycle, 4¼x5, 30 H. P. motor, under on three-point suspension; mechanical valves d; Parson's white brass crank shaft and cam bearings; jump spark ignition, with Atwater-park generator and dry cells; mechanical lubri-multiple disc clutch; selective, 4-speed change n plain bearings, direct on third speed, operated d lever; shaft drive to live rear axle; I-section

mounted on frame from integral arms of the bronz crank case; mechanically operated valves, inverte at 45 deg. angle in cylinder head, operated by rocke arms; bronze babbitt lined crank shaft bearings

WELCH MODEL 6-L. $6000.

Parson's white brass die cast cam shaft bearings 2 separate ignition systems from storage battery an Bosch magneto; force-feed lubrication by Hill pre cision oiler; multiple disc clutch; individual clutc transmission on bronze babbitt lined bearings, give 3 speeds forward and 2 reverse, direct on the high operated by one lever forward and one reverse, gear always in mesh; shaft drive to live rear axle; one piece I-section drop forged front axle; 138-inch whee base; 36-inch wheels, 5-inch tires; bronze bab bitt lined wheel bearings; semi-elliptic fron springs, 40-inch by 2¼, 11 leaves, full elliptic spring at the rear, 45 inches, 2¼, 9 leaves; prest chrom nickel steel channel section frame, sub-frame angl iron, worm and sector steering gear; Welch interna and external brakes; 28-gallon gasoline tank unde the front seat; 6 gallons in reserve; 5 or 7 passen gers; weight, complete car, 4000 lbs.; equipment lamps, 2 gas, 2 oil, 1 tail; Prest-O-Lite tank, too kit and horn, extra set of spark plugs; price, $6000.

WELCH MODEL 6-I LIMOUSINE. $7000.

Welch Model 6-I limousine; general specifications the same as Model 6-L touring car; weight, complete, 4400 lbs., with same equipment; price, $7000.

Welch Model 4-L touring car; 4-cylinder, water-cooled, motor, using Welch honeycomb radiator; bore 4⅝, stroke 5, 50 H. P. motor under hood, supported from the frame on integral arms from the bronze crank case; inverted mechanically operated valves set in the head at 45 degrees; bronze babbitt lined crank shaft bearings; die cast Parson's white brass cam shaft bearings; 2 separate ignition systems, using storage battery and Bosch magneto; force-feed lubrication; individual clutch transmission, using multiple disc clutches, mounted on bronze babbitt lined bearings, giving 3 speeds forward and 2 reverse, direct on the high speed, operated by one lever forward and one reverse; shaft drive to live rear axle; I-beam one-

WELCH MODEL 4-L TOURING CAR. $4500.

piece drop forged front axle; 129-inch wheel base; 36-inch wheels on bronze babbitt lined bearings; 4½-inch tires; prest nickel steel channel section frame; angle iron sub-frame; semi-elliptic front springs, 40 by 2¼, 9 leaves, full elliptic rear springs, 45 inches

AYNES MODEL W, 5-PASSENGER TOURING CAR. $3000.

Haynes Model W, 5-passenger touring car, with aight line body; motor, 4 cylinders, cast in pairs; ter-cooled, 4¾x5-inch, 45 H. P., under the hood front; valves mechanically operated on opposite les of the cylinders; crank shaft bearings plain and ecial roller bearings; cam shaft bearings plain; ig-ion, jump spark from dry batteries and Bosch mag-to; force feed; lubrication; band clutch; selective ding change speed gear, mounted on roller bearings, ving 3 speeds forward and 1 reverse, direct on th, operated by hand lever; shaft drive to live rear le; front axle I-section drop forging; 108-inch wheel se; 34-inch wheels, on Timken roller bearings, fitted th 4-inch tires; prest steel frame; semi-elliptic rings front and rear, front, 34½x2 inches, and rear, x2 inches; adjustable worm and gear steering; in-rnal and external expanding and contracting brakes rear wheel hubs, foot pedal and hand lever con-l; passenger capacity, 5; 20-gallon tank, under nt seat; weight, complete, 3000 lbs.; price, with mps, horn, full set of tools, $3000.

AYNES MODEL U, 7-PASSENGER TOURING CAR, $3750.

Haynes Model U straight line body, 7-passenger uring car; motor, 4 cylinders, 5½x6, water-cooled, H. P., under the hood at the front, supported by ns from the upper half of the crank case; valves opposite sides, mechanically operated; general assis specifications as regards ignition, oiling and ange speed gears same as Model S; wheel base, 3 inches; wheels, 36 inches, mounted on Timken ler bearings and fitted with 4½-inch tires; prest el frame, semi-elliptic springs front and rear, nt 39½, width 2½; rear, 45½, width, 2½; adjust-le worm steering gear; internal and external brakes rear wheels, operated by foot and hand levers, ark and throttle on steering wheel; 20-gallon gaso-e tank, under front seat; complete car weight, 50 lbs.; price, with lamps, horn and full set of ols, $3750.

Haynes Model U Roadster, same chassis specifica-ns as Model U touring car. Haynes Model U mousine, same specifications as Model U touring r. Haynes 1908 cars described in our December, 07, issue, page 102.

HAYNES MODEL S TOURING CAR, $2500.

Haynes Model S, 5-passenger, straight line body uring car; motor, 4 cylinders, cast in pairs, water-oled, 4¼x5, 30 H. P., located in the front by arms

foot lever and hand lever; 18-gallon gasoline under the front seat; complete car weight, 2500 price, with lamps, horn and full set of tools, $2

Single Centre Gasoline Cars.

Made by the Single Centre Buggy Co., Evansville,

SINGLE CENTRE AUTO BUGGY, $675.

Single Centre Auto Buggy; roadster style of b price, $675; 2-cylinder, opposed, water-cooled, 4-c motor, 5-inch bore, 4-inch stroke, 15-17 H. P., set der hood in front, suspended from lugs on en cylinders; mechanically-operated valves; ignition rent from dry cells; self-contained lubricating sy in engine; friction transmission, mounted on r bearings; double chain drive; 1⅜-inch solid tires inches in front and 38 inches in rear; Timken r wheel bearings; 84-inch wheel base; 2-inch s steel frame; elliptic springs, 36x1½ inches, 4 le front and rear; reversible steering gear; two band reverse brakes on transmission; side lever spark throttle control, also foot accelerator; seats 2 c 12-gallon gasoline tank, located under front weight, 900 lbs.; equipment, 3 lamps and horn.

SINGLE CENTRE ROADSTER, $800.

Single Centre Roadster; price, $800; wheel base inches; 32x3-inch tires; all other specifications as for the Auto Buggy. Described in our Jan 1908 issue, page 110.

Chief Gasoline Cars.

Made by Chief Mfg. Co., 624 Ellicott Sq., Bu N. Y.

CHIEF MODEL A RUNABOUT, $600.

Chief Model A Runabout; 2-cylinder, vertical, w cooled, 2-cycle, 3½x4, 10-12 H. P. motor, front, u hood, on four-point suspension; babbitt crank s bearings; jump spark ignition from dry cells;

OLBURN TOURING CAR, MODEL C, $3250.

burn 5-passenger Model C touring car; price,); 4-cylinder, 4-cycle, 4½x5, 30 H. P. motor in under hood; Bosch high tension magneto igni- system; double pump force feed oiler; 4 speeds ard, direct on third, selective type transmission,

OLBURN ROADSTER, MODEL D, $3250.

ted on Hess-Bright bearings; cone clutch; 4 s on rear wheels; floating type rear axle; drop d I-section steel front axle; springs, 50½x2 ins.; s on Timken roller bearings; with roadster body, chassis specifications for the touring car, $3250.

Tincher Gasoline Vehicles.

by the Tincher Motor Car Co., South Bend, Ind.

HER MODEL H 7-PASSSENGER CAR, $6500.

cher Model H straight line body, 7-passenger g car; 4-cylinder, vertical, water-cooled motor, 6, 50 H. P., under the hood; mechanical valves ad operated by overhead cam shaft; crank shaft ngs, alligator metal; cam shaft bearings jump spark ignition from storage battery and on; splash and centrifugal force-feed lubrication; acting band clutch; 4-speed selective sliding e gear, on annular ball bearings, direct on the double chain drive to solid truck I-section rear front axle same; 127-inch wheel base; 36-inch s on annular ball bearings; 4-inch front and 5- rear tires; nickel prest steel frame, no sub- ; semi-elliptic springs front and rear; front, 2 inches, 8 leaves; rear, 52 by 2¼ inches, 10 ; segment and pinion steering gear; four brakes ar wheel drums; spark and throttle control on nary sector on steering wheel; 32-gallon gaso- tank in the rear of frame; complete weight, lbs.; special features: Krupp nickel chrome used throughout; price, $6500.

1-section rear axle; front axle same; 110-inch wh base; 36-inch wheels on annular ball bearings; 3 inch front and 4-inch rear tires; semi-elliptic sprin front and rear; front, 32 by 2, 7 leaves; rear, 50 2¼, 8 leaves; segment and pinion steering gear; brakes on rear wheels; spark and throttle control steering wheel; gasoline capacity, 32 gallons at re of frame; seating capacity, 3; weight, complete, 27 lbs.; price, with complete equipment, $5500.

6-CYLINDER TINCHER ROADSTER, $7500.

6-cylin. Tincher roadster; motor, 6-cylin., vertic water-cooled, 5 by 6, 90 H. P., under hood, suppo ed on four arms to main frame; overhead cam sha with mechanical valves in head; alligator metal cra shaft and cam shaft bearings; jump spark ignitio from storage battery and Bosch magneto; splash a centrifugal force-feed lubrication; contracting ba clutch; 4-speed selective sliding change gear, dire on the fourth and mounted on annular ball bearing double chain drive to Krupp I-section rear axle; section front axle; 127-inch wheel base; 36-in wheels on annular ball bearings; 4-inch front a 5-inch rear tires; semi-elliptic springs front a rear; front, 32 by 2, 8 leaves; rear, 52 by 2¼, leaves; segment and pinion steering; 4 brakes on re wheel drums; spark and throttle control on steeri wheel; 32-gallon gasoline tank in rear of frame; sea ing capacity, 3 or 4 persons; weight, complete, 29 lbs.; completely equipped, $7500. Special featur Krupp chrome nickel steel throughout.

Blomstrom "30" Gasoline Cars.

Made by the Blomstrom Mfg. Co., Leib & Wight Sts Detroit, Mich.

BLOMSTROM "30" TOURING CAR, $2250.

Blomstrom "30" 5-passenger touring car; pric $2250; 4-cylinder, vertical, water-cooled, 4 3-16 bor 4½ stroke, motor under hood in front; prest ste frame; half-elliptic springs in front and full ellipt in rear; dropt tubular rear axle, Weston-Mott re axle; shaft drive, direct on high; 3 speed forwa and reverse, selective type transmission; wheel bas 110 ins.; jump spark ignition; spark and thrott control on top of steering wheel; 32x3½-in. clinch tires; mechanically operated valves; mechanical oile irreversible steering gear; internal and external hu brakes; 15-gal. gasoline tank; double cone clutc weight, 2150 lbs.; equipment: 2 gas and 3 oil lamp horn and tools. Described in our November, 190 issue, page 63.

POPE-TOLEDO TYPE XVI. $4250.

Pope-Toledo Type XVI, curved line, 5-passen-er touring cars; 4-cylinder, vertical, water-cooled motor; 50 H. P., located under the hood, on sub-frame; valves in cylinder heads, operated y walking beams; D. W. F. crank shaft ball-bear-ngs; bronze cam shaft bearings; double ignition, 2 ets of plugs, storage battery and magneto; sight feed ubrication; multiple disc clutch; selective sliding hange speed gear, 4 speeds forward and 1 reverse, irect on the third speed; double chain drive to rear xle of I-section chrome nickel steel; front axle, I-ection chrome nickel steel; 115-inch wheel base; 6-inch wheels; 4-inch front and 4½-inch rear tires; heel bearings, .D W. F.; prest steel frame, inverted prest steel sub-frame; semi-elliptic front springs, 8x2 inches, 7 leaves; semi-elliptic rear springs 50x2 nches, 7 leaves; irreversible worm and sector steering ear; 2 brakes on the rear wheels and 1 on the driv-ng shaft; spark and throttle control on the steering heel; passenger capacity, 5; 25-gallon gasoline tank n the rear; weight complete, 3200 lbs.; equipment, 5 amps, complete set of tools; price, $4250. Special eature: prest steel body.

POPE-TOLEDO TYPE XVII. $4500.

Pope-Toledo Type XVII, straight line, 5-passenger ody; 4-cylinder, water-cooled, 50 H. P. motor, under he bonnet, on a sub-frame; valves in the head, oper-ted by walking beams; crank shaft bearings, D. W. . balls; bronze cam shaft bearings; double ignition ump spark from storage battery and magneto, using wo sets of plugs; mechanical feed lubrication; multi-le disc clutch; selective sliding change speed gear, speeds forward and 1 reverse, direct on the third, nounted on D. W. F. ball-bearings; double-side chain rive; I-beam chrome nickel steel rear axle; front xle the same; 126-inch wheel base; 36-inch wheels; -inch front and 4½-inch rear tires, mounted on . W. F. bearings; prest steel inverted U-section rame; prest steel sub-frame; semi-elliptic springs ront and rear; front, 38x2, 6 leaves, and rear, 52x2, leaves; steering gear, irreversible worm and sec-or; brakes, 2 on rear wheels and 1 on driving shaft; park and throttle levers on steering wheel; 27-gallon asoline tank, in the rear; passenger capacity, 5; veight complete, 3400 lbs.; equipment, 5 lamps, com-lete set of tools; price, $4500.

POPE-TOLEDO TYPE XVIII RUNABOUT. $4500.

POPE-TOLEDO TYPE XII. $3000.

ings; bronze cam shaft bearings; double jump ignition, 2 sets of plugs, including storage b and magneto; mechanical feed lubrication; mu disc clutch; 4 speeds forward and 1 reverse, sel sliding change speed gears, on D. W. F. bearing rect on the third speed; double chain drive; I-s chrome nickel steel axle; front axle, same; 10 wheel base; 36-inch wheels, on D. W. F. bearin inch front, 4½-inch rear tires; semi-elliptic s front and rear; front, 30x1¾, 7 leaves, and rea 1¾, 7 leaves; irreversible worm and segment steering gears; 2 brakes on rear wheels and driving shaft; capacity, 5 persons; 17-gallon ga tank, in the rear; equipment, 5 lamps and co set of tools; price, $3000. 1908 Pope-Toledo described in our January, 1908, issue, page 190

Aerocar Gasoline Cars.

Made by the Aerocar Motor Co., Detroit, M

AEROCAR MODEL D. $1500.

Aerocar Model D, light touring car body; s persons, weighs complete, 2000 lbs.; motor, 4 cyl air-cooled; bore 4-inch, stroke 4-inch, 20 H. P.; on sub-frame, under hood; valves in the head o by rocker arms; ignition jump spark, from battery with dry cells in reserve; force feed l tion; multiple-disc clutch, 3 speed sliding change mounted on roller and ball-bearings; shaft front axle seamless steel tube; tires 34x3½ wheels on ball-bearings; wheel base, 104 inches; prest steel; semi-elliptic springs in front and inches in width, front 40 inches long, with 6 and the rear 42 inches long, with 8 leaves; s by nut and screw; 2 sets of brakes, emergency mission brake and rear hub expanding brakes; line capacity, 17 gallons, in tank under front equipment: 5 lamps, generator, French tube carpet, tool and tire kit. Price, $1500.

AEROCAR MODEL E TOURING RUNABOUT.

Aerocar Model E Touring Runabout; same chas Model D, but is fitted with the touring runabout suitable for carrying 3 persons, the rumble seat removable; car complete weighs 1800 lbs. Price,

Aerocar Model F Touring Car; seats 5 perso cylinder, water-cooled, 40 H. P. motor, 5x5, 1 on the sub-frame, under the hood; valves on one the crank shaft bearings are bronze and the shaft bearings are Babbitt; ignition jump spark storage battery, dry cells in reserve; lubrication feed; multiple disc clutch; 3 speed sliding gear, mounted on ball and roller bearings; shaft front axle is of seamless steel tubing; 34-inch w on ball-bearings, fitted with 4-inch tires, fron rear; wheel base, 115 inches; frame prest steel; elliptic springs, front and rear, 2 inches wide,

HMOND MODEL I, 5-PASSENGER TOURING CAR, $2000.

chmond Model 1, 5-passenger touring car; price 0; 4-cylinder, 4-cycle, air-cooled, 4¼-inch bore 4½-inch stroke; 30 H. P. motor, set in front r hood, bolted to main frame; mechanically oper- valves; 5 crank shaft bearings and 3 cam shaft ings; jump spark ignition by storage and dry ; splash lubrication; cone clutch; 3 speed selective ng change gear, direct on high, operated by hand- ; mounted on plain bearings; shaft drive; tu- rear axle and I-beam front axle; 34x4-inch tires; r wheel bearings; 108-inch wheel base; angle iron armored frame; semi-elliptic springs, front and 38x2-in, 7 leaves in front and 40x2-inch, 6 s rear; sector and pinion steering gear; internal nding and external constricting brakes on rear ; spark and throttle control on steering wheel. foot pedal throttle control; 17-gallon gasoline under foot seat; weight 2400 pounds; equipment. s lamps and generator, 2 oil dash lamps, tail s and tools.

RICHMOND 4-PASSENGER TOURING CAR.

chmond Model H, 4-passenger touring car; 4- nder, 4-cycle, vertical, air-cooled, 4-inch bore and ke, 26 H. P. motor, set under head in front main frame; mechanically operated valves; 5 k shaft and 3 cam shaft bearings; jump spark ion by dry cells; splash lubrication; cone clutch; ressive sliding change speed gear, 3 speed for- l and reverse, operated by hand lever, mount- n plain bearings; shaft drive, tubular rear axle I-beam front axle; tires 30x3½-inch; roller wheel ings; 91-inch wheel base; angle iron wood armor- rame; elliptic springs front and rear, 36x1¾-inch, eaves in front and 38x1¾-inch, 5 leaves in sector and pinion steering gear; internal ex- ling brakes on hubs; spark and throttle control by ls on steering wheel, also throttle control by lever; 12-gallon gasoline tank under front seat; ght, 18,000 pounds; equipment, 2 gas lamps and rator; 2 oil dash lamps, tail lamp and tools. chmond, Model J, runabout; 4-cylinder, 4-cycle ooled, 3¾-inch bore by 4-inch stroke, 22 H. P. or; progressive sliding change gear, 2 speeds, ard, direct or high; 30x3-inch tires; semi-elliptic t springs and full elliptic rear springs, 4 leaves ear; 88-inch wheel base; other specifications same for Model H touring cars.

Crawford Gasoline Cars.

e by the Crawford Automobile Co., Hagerstown, Md.

re-enforced front axle; tires, 34 by 4-inch; ball wh bearings; wheel base, 114-inch; prest steel ma frame and angle iron sub-frame; semi-elliptic sprin front and rear, 42 by 2-inch, 8 leaves, in front, a 49 by 2-inch, 8 leaves, in rear; irreversible type ste ing gear; 4 internal expanding brakes; seats 5; gallon gasoline tank under front seat; weight, 2600 l

CRAWFORD MODEL D RUNABOUT. $2500.

Crawford Model E, touring car, price $2500; 4-cyl der, vertical, water cooled, 35 H. P. motor, locat in front on sub-frame, cylinders, 4½-inch bore by inch stroke; mechanically operated valves; bro crank and cam shaft bearings; jump spark ignition storage or dry cells, magneto extra; force feed lub cation; multiple disc clutch; selective type cha speed gear, three speeds forward, direct on hi operated by side lever, ball bearings; double ch drive; tubular front and rear axles; tires, 34 by 4-in ball wheel bearings; wheel base, 106-inch; prest st main frame; angle iron sub-frame; semi-elliptic spri front and rear, 42 by 2-inch, 7 leaves, in front, 49 2-inch, 7 leaves, in rear; band brakes on rear and transmission cross shaft; 5-passenger capaci 15-gallon gasoline capacity, tank under seat kno as Model D; weight, 2500 lbs. This chassis is a furnished with a runabout body seating three; wh base, 114 inches; price $2500; weight, 2200 lbs. other specifications are the same as for the tour car.

CRAWFORD MODEL F TOURING CAR. $3500

Model F touring car, price $3500; 7-passengers; 4-c inder, water cooled 50 H. P., vertical motor; cy rders, 5-inch bore by 5½-inch stroke; three speeds ward, direct on third; 2¼-inch springs front and re 9 leaves in rear springs; weight 2800 lbs.; all ot specifications are the same as for Model G touring c 1908 models described in our Februray, 1908, iss page 88.

Hay Berg Gasoline Cars.

Made by Hay Berg Motor Car Co., Milwaukee, W

HAY BERG MODEL B ROADSTER, $2000.

Hay Berg Model B roadster, runabout body rumble seat; price, $2000; 4-cylinder, vertical, wa cooled, 4-cycle, 4¼ bore, 4¾ stroke, 28-30 H. P. m under hood on sub-frame; all valves on one side; B son's white brass crank and cam shaft bearings; ju spark ignition with storage battery; self-contai oiling system; cone, cork inserted clutch; se tive sliding change speed gear 3 forward spe and reverse, direct on high, operated by hand le and mounted on roller bearings; shaft drive; Tim

CLEVELAND TOURING CAR, $3500.
leveland touring car; 4-cylinder, 4-cycle, 40-45 H. water-cooled motor, located under hood and sus-nded on sub-frame; cylinders, 5-inch bore and stroke; aight line metal body; mechanically operated valves; rsons white metal crank shaft bearings and bronze n shafts; 2 systems of ignition, by storage battery l magneto; pump lubrication, oil reservoir in crank e; coneoidal multiple disc clutch, having 52 discs, ective change gear, 4 speeds forward and reverse. ect on third, running in F. & S. annual ball-bear-s; shaft drive; floating type rear axle, I-beam nt axles; tires 34x4-inch front, 36x4½-inch rear; l wheel bearings; wheel base, 122 inches; half-ptic front springs, 43x2 inches, 7 leaves, in front; tform rear springs, 50x2 inches, 11 leaves; nut l worm steering gear; internal expanding brakes rear wheels; foot accelerator; spark and throttle wheel; seating capacity, 7; weight, 2800 lbs.; gaso-e capacity, 21 gallons, tank under front seat; equip-nt, 5 lamps, generator, French horn, oak tool box. ce, $3500. This chassis is also furnished with about and limousine body. 1908 Cleveland cars cribed in our December, 1907, issue, page 67.

U. S. Air-cooled Gasoline Car.

de by the U. S. Motor Car Co., Upper Sandusky, Ohio.

U. S. MODEL 2-PASSENGER CAR, $900.
. S. Model 2-passenger car; price, $900; 4-cylinder, tical, air-cooled, 4-cycle, 3¼-inch bore and stroke, H. P. motor, located under hood on sub-frame; me-nical valve action; Babbitt crank and cam shaft rings; jump spark ignition, by dry cells; force feed splash lubrication; contracting band clutch; slid-progressive change speed gear, 3 forward speeds reverse, direct on high; operated by hand lever, nted on ball-bearings; shaft drive; ball-bearing live r axle and tubular front axle; 32x3-inch tires; ball eel bearings; 96-inch wheel base; hickory frame; l angle sub-frame; full elliptic springs, 40x1¾ hes, 5 leaves, front and rear; Brown-Lipe steering r; 2 brakes on rear hubs and 1 on driving pinion ft; spark and throttle control on steering post; 10-lon gasoline tank under seat; weight, 1450 lbs.; ipment, full kit of tools, pump, tire and repair lit; special features; cold air valve, controlled by ottle lever, shuts off mixture and admits air to nder; acts as a brake and is an efficient cooling ncy. Described November, 1907, page 146.

Firestone Air-cooled Motor Buggies.

Made by Columbus Buggy Co., Columbus, O.

on Timken bearings; 1⅜-inch solid tires; 7½ wheel base; armored wood frame, steel sub-fra full elliptic springs, 36 inches long in front and inches rear; side lever steering; countershaft br and emergency brakes on tires; single lever con passenger capacity, 2 persons; weight, 1200 lbs. gallon gasoline tank, back of seat; equipment, horn, tools and lamps.

Stevens Duryea Gasoline Cars.

Made by the Stevens Duryea Co., Chicopee F Mass.

STEVENS-DURYEA MODEL R, 5-PASSENG TOURING CAR, $2500.
Stevens-Duryea Model R, 5-passenger touring price, $2500; 4-cylinder, vertical, 4-cycle, water-coo 3⅞ bore, 4½ stroke, 20 H. P. motor, in front u hood; jump spark ignition; dry batteries; shaft dr 3 forward and 1 reverse sliding change speed g internal expanding brakes on rear wheels and tracting brakes on transmission; multiple disc clu wheel base, 90 ins.; tires, 30x3½ front and rear; p $2500; top, $100 extra.

Stevens-Duryea Model R, limousine; tires, 31x4 front and rear; other specifications same as for Model R touring car; price, $3300.

STEVENS-DURYEA MODEL U, LIGHT SIX, $3
Stevens-Duryea Model U "Light Six;" 6-cylin 35 H. P., vertical, water-cooled, 3⅞ bore, 4¾ str under hood in front; jump spark ignition; sto and dry cells; shaft drive; 3 speed forward and reverse, sliding gear transmission; seats 5; mult disc clutch; 114-in. wheel base; tires, 34x4 ins.; tracting and expanding brakes on rear wheels; p $3500; cape top, $150 extra.

STEVENS-DURYEA MODEL U, LIMOUSINE, $4
Model U limousine; seats 7; other specifications s as for Model U touring car; price, $4500.

l frame main and sub-frame; semi-elliptic springs
t and rear, 40 by 2-inch, 8 leaves in front, and
by 2-inch, 10 leaves, in rear; worm gear steer-
gear; two brakes on each rear hub; spark and
ttle control on top of wheel; seats 5; 20-gallon
line tank under front seat; weight, 2800 lbs.;
pment: 5 lamps, generator, 1 horn and set of
s. Roadster Model A, weight, 2300 lbs.; 16-gal-
gasoline tank under front seat; front springs,
aves, and rear springs, 8 leaves; price $2250; all
r specifications same as for the touring car.

Lindsley Gasoline Pleasure Cars.

e by J. V. Lindsley Co., 2207 College Ave., Indianapolis, Ind.

LINDSLEY RUNABOUT. $475.
dsley runabout, piano box body; 2-cylinder, verti-
10 H. P., air-cooled motor, 4-inch bore and 4-inch
ke, under body; mechanical valves in the head;
k shaft and cam shaft bearings bronze; jump
k ignition, dry cells; force-feed lubrication; plan-
y change speed gear, 2 speeds forward and 1 re-
e, operated by lever and foot pedal; double chain
e to the rear wheels; 70-inch wheel base; 36-
wheels with 1⅛-inch solid tires; elliptic springs,
by 2¼ inches, 5 leaves; tiller or wheel steer, as
red; brakes on rear wheel drums; spark advance
side of seat; foot throttle; carrying capacity, 2
ons; 4 gallons of gasoline under seat; weight,
plete, 850 lbs.; price, $475. Tops, lights, etc., ex-

Perfection Gasoline Cars.

e by the Perfection Auto Works, South Bend, Ind.

PERFECTION 5-PASSENGER CAR. $1850.
semi-elliptic springs front and rear; front, 45x2,
leaves, and rear, 49x2, 7 leaves; worm and sec
steering gear; 2 external brakes on rear wheels,
emergency brake on line shaft; spark and throt
control on steering wheel; 20-gallon gasoline t
under front seat; passenger capacity, 5; weight c
plete, 2250 lbs.; price, with lamps, tire and t
equipment, $1850. Special features: cast alumin
dash and special radiator.
Perfection 6-cylinder car, water-cooled, 4½x5,
H. P.; general specifications, with the exception
wheel base, which is 134 inches, same as the 4-cy
der model; price, $2500.

Cosmopolitan Air-Cooled Gasoline Car

Made by the D. W. Haydock Auto Mfg. Co., Louis, Mo.

COSMOPOLITAN TYPE 4. $625
Cosmopolitan Type 4; 2-cylinder, horizontal, oppos
air-cooled motor, 4x4, 10-12 H. P., motor located
the front, under the hood, suspended by lugs on
cylinders; automatic valves on top; crank shaft be
ings, Parson's white brass; jump spark ignition fr
dry cells; forced sight feed lubrication; friction cha
speed gear, all speeds forward and reverse, fitted w
thrust ball-bearings; single chain drive; 1¼-inch
rear axle; front axle, 1¼ square steel; 87-inch wh
base; high wheels, of large diameter; roller bear
at the rear and plain in the front; 1¼-inch solid ti
2-inch angle steel frame; full elliptic springs fr
and rear, 36x1¼ inches, 5 leaves; rack and pin
steering gear; 1 brake on differential, 1 on each r
wheel; control of friction disc by hand lever
pedal; 8-gallon gasoline tank, under the seat; pass
ger capacity, 2; weight complete, 1000 lbs.; pr
without top, $625; with top, $650.
Cosmopolitan Type 5; 2-cylinder, horizontal, oppos
air-cooled motor and general chassis specifications
Model 4; passenger capacity, 3 persons; price, $
with top.
Cosmopolitan Type 6; general specifications same
the Type 4 runabout; seating capacity, 4 persons, w
rear seat; weight, 1100 lbs.; price, $675, open; $
with extension top.

WALTER 7-PASSENGER TOURING CAR. $500

RAYER-MILLER PHILADELPHIA RUNABOUT. $2250.

Frayer-Miller Philadelphia Runabout, price $2250: cylinder, 4-cycle, vertical, air cooled, 24 H. P. otor, located under hood on four-point suspension; linders, 4 1-16 bore, 5⅛ stroke; mechanically op-ated valves; Parsons white brass crank shaft bear-gs and bronze cam shaft bearings; Atwater Kent nition with dry cells; McCord Precision oiler; ne clutch; selective type change speed gear on rear le; 3 speeds forward and reverse, direct on high, erated by hand lever and running in ball bearings; aft drive; floating type rear axle, I-beam front le; tires, 32 by 4-inch; ball wheel bearings; 100-ch wheel base; prest steel main and sub-frame; mi-elliptic springs, 40 by 2-inch, 7 leaves, in front d full elliptic, 38 by 2-inch, 5 leaves in rear; ir-versible steering gear; internal and external brakes rear wheels; spark and throttle control on top steering; seats 2; 20-gallon gasoline tank in back at; weight, 1850 lbs.; equipment: 2 front oil lamps, side lamps, tail light, tool kit and tire holder.

FRAYER-MILLER COMBINATION RUNABOUT. $2500.

Frayer-Miller combination runabout, price $2500, th all combinations; rear springs semi-elliptic, 52 2-inch, 7 leaves; weight 2250 lbs.; 15-gallon gas-ne tank under seat; seats 4. All other specifi-tions are the same as for model Philadelphia Run-out.

FRAYER-MILLER MODEL D TAXICAR.

Frayer-Miller Model D taxicab; 4-cylinder, cal, air-cooled, 4-cycle, 4 1-16 bore, 5⅛ stroke H. P. motor in front under hood; mechanically ated valves on top of cylinder; Parson's white crank shaft bearings and phosphor bronze cam bearings; Atwater-Kent ignition system with cells; McCord force feed lubrication; cone clut speed and reverse, direct on high, sliding cl speed gear, operated by side lever and mounte ball bearings; shaft drive; I-beam front axle; in. tires; prest steel frame, angle iron sub-fr half-elliptic springs, 40x2 ins. in front, and full tic, 44x2 ins. in rear; worm and gear steerin brakes; control details on top of steering gear; 1 gasoline tank under seat; weight, 2500 lbs.; e ment; 2 gas lamps, 2 side and 1 tail oil lamp

Aurora Gasoline Cars.

Made by the Aurora Motor Works, Aurora, I

AURORA RUNABOUT MODEL B, $775.

Aurora 3-passenger Runabout Model B; 2-cyli horizontal opposed, water-cooled, 4½x5, 20 H. P. tor; mechanically operated intake and exhaust va positive feed lubrication; jump spark ignition, two sets of batteries; two speed forward and re planetary transmission, direct on high speed; gear drive; tubular front axle; angle steel fr semi-elliptic springs front, 39 ins. long, 1¾ ins. 4 leaves; platform springs rear, 40x1¾ ins.; base, 80 ins.; 32-in. wheels, equipped with cli or Goodyear quick detachable rims; 3-in. soli pneumatic tires; internal expanding and ext band, camel's hair lined brakes on steel drum rear wheels; spark and throttle control levers steering wheel; weight, about 1500 lbs.; 10-gal. line tank under seat; price, $775, including two oil lamps, one rear oil lamp, chime horn, tire r kit, floor mat and tools. Large compartment at of seat and extending to rear end of body for extra tires, baggage, etc.; this compartment ma removed, leaving flat deck for trunk, baggage, et

. V. I. 6-CYLINDER RUNABOUT, $4000.

cal oiler and splash system of lubrication; I-section nickel steel front axle and floating type axle; wheel base, 117 ins.; cone, leather faced, inserted, clutch; bevel gear drive; F. & S. im-d bearings; worm and sector steering gear; front ls, 36x3½, rear, 36x4; 16-gal. gasoline tank; ment: 2 headlights, 2 dash lamps, tail lamp, generator, complete tool equipment with jack; $4000. Described in our January, 1908, issue, 98.

V. I. runabout; seats 3 or 4; same chassis spe-tions as for the touring car; price, $4000.

ennegin Air-Cooled Gasoline Cars.

by the Commercial Automobile Co., Chicago, Ill.

nnegine Model G Family and Utility Car, No. 8; inder, 4-cycle, horizontal, air-cooled, 4½x4, 12-14 P. motor, under foot-boards, on three-point sus-on; mechanical valves in cylinder head; adjust-bronze crank shaft bearings, 5 and 8 inches, ctively; bronze cam shaft bearings; jump spark ion, from storage battery, dynamo if desired; feed mechanical lubrication; no clutch; friction mission on roller bearings; no set positions for ls; roller side chain drive; tubular trust axle; ar front axle; 1½-inch solid rubber tires; hard e, grease-packed wheel bearings; 87-inch wheel

NNEGIN MODEL F PHYSICIAN'S CAR, $650.

channel steel frame; no sub-frame; full elliptic gs front and rear; front, 34 inches long, 1¼ s wide, 4 leaves; rear, 34 inches long, 1¼ inches 5 leaves; wheel steering with spur gear reduc-external, 10x1¾, double-acting brakes; spark ol by hand on steering column; automatic gov-for gas; capacity, 4 persons; weight, 1200 lbs.; llon gasoline tank, under seat; 1 gallon in re-; equipment, 3 oil lamps, full set tools and oil ; price, $725. Special features: Automatic gov , accessibility and left side control.

nnegin Model F Physician's Car, No. 4. This car uilt on the same chassis as the Model G, but has 75-inch wheel base, and the rear springs con-4 leaves instead of 5; weight, 1100 lbs.; passen-capacity, 2 or 3; price, $650.

Frontenac Gasoline Cars.

e by the Abendroth & Root Mfg. Co., Newburg, N. Y.

FRONTENAC TOURING CAR, $4000.

in. wheel base; price, $4000. This chassis is al furnished with touring car body, seating 7; weigh 3300 lbs.; price, $4000; also with type E limousi body, weighing 3600 lbs., price, $5000. The price the runabout and the touring car includes the follo ing equipment: full set of lamps, horn, folding ba gage carrier, full set of tools in a metal box running board. 1908 Frontenac cars described in o October, 1907, issue, page 152.

Studebaker Gasoline Cars.

Made by the Studebaker Automobile Co., South Ben Ind.

STUDEBAKER MODEL B 40 H. P. TOURING CA $4250.

Studebaker Model B 40 H. P. touring car; 4-cylind vertical, water-cooled, 4¾x5¼ inches, 40 H. P. mot in front under hood, make and break ignition Simms-Bosch low tension magneto; mechanically op ated valves; 4 speed forward and 1 reverse, dire on third, selective type transmission; cold rolled pr steel frame; 114-inch wheel base; spark and throt levers on steering wheel; stationary segment, ir versible steering by wheel; positive feed mechani oiler; 34-inch wheels; Standard clincher 4½-inch tir brakes, internal expanding on rear axle, actuated hand lever, and external constricting by foot ped dropt forged nickel steel I-beam front axle, mount on ball bearings and composite construction rear ax bevel gear drive; semi-elliptic springs in front a semi-platform in rear; 20-gallon gasoline tank; equ ment, 2 acetylene headlights with generator, two side lights, 1 oil rear light, horn, tire carriers, ga line gage, jack and complete outfit of tools; weig 3050 lbs.; price, $4250. Cape top, $150 extra.

STUDEBAKER MODEL H 30 H. P. TOURING CA

Studebaker Model H 30 H. P. touring car; 4-cylind vertical, water-cooled, 4⅛-inch bore, 5¼-inch stro 30 H. P.; 3 speed forward and 1 reverse; progressi sliding type transmission, controlled by one lev direct drive on third speed; 104-inch wheel base; by 4-inch clincher tires on artillery type wheels; ternal expanding brakes on rear axle and exter constricting on transmission drum; drop forged nic steel I-beam front axle, composite construction b bearing rear axle; bevel gear drive; semi-ellip

BAKER ELECTRIC MODEL M. PRICE $2500.

Baker Electric Model M, roadster body; motor, 4-e, series wound, mounted in the middle of the assis on a two-point spring suspension (patent ap-ed for); 3½ H. P.; overload capacity, 300 per t.; battery consists of 40 80-volt, 96-ampere hour ide cells; complete weight of battery, 950 lbs.; con-oller, drum, continuous torque system, giving 9 rward speeds and 3 reverse; drive by shaft and el gears; tubular front axle and live rear axle; inch artillery ball-bearing wheels, fitted with 4-h pneumatic tires; armored wood frame; semi-el-tic springs front, 44 inches long, 2 inches wide, 7 ves rear, 50 inches long, 2 inches wide, 7 leaves; o sets of brakes, all internal expanding, one set rear wheel drums, the other on shaft, operated by t levers; equipment, top and shock absorbers. Spe-l features: great mileage, speed of from 3 to 30 les without using resistance. Price $2500.

KER ELECTRIC MODEL L. QUEEN VICTORIA, $1800.

aker Electric Model L, Queen Victoria; 2 H. P. tor, of 300 per cent. overload capacity, 4-pole, les wound, located under the seat, mounted on tubu-frame, so that it is free to oscillate; battery, 24

brakes on rear wheels, pedal operated. Specia tures; batteries in series at all speeds; all par annular ball-bearings; 3 bodies interchangeabl same chassis; speed changes without sparking; mileage on single charge. On this chassis Queen toria Coupe and Extension Coupe bodies are fi

BAKER COUPE. $3000.

Baker Coupe; 2½ H. P. motor, 300 per cent. load capacity; transmission, silent chain reduc shaft and bevel gear drive; batteries, 28 cells, 9 wheel base, 92½ inches; 36-inch artillery wheels by 3½ inches tires front, 36 by 4½ rear, double pneumatics; side lever steering; two internal br on rear axle operated by foot lever, one internal b on transmission shaft operated by controller le semi-elliptic springs front and rear; mileage ca ity, 40 miles on a single charge of battery; p $3000.

BAKER VICTORIA. $3000.

Baker Victoria; price, $3000; wheel base, 86½ inc other specifications same as Coupe.

BAKER STANHOPE. $1600.

tor, 300 per cent. overload; controller, 3 speeds d and reverse; single chain drive; price, $1600; specifications, same as for Coupe.

BAKER DEPOT CARRIAGE. $3000.

r Depot Carriage; price, $3000; wheel base, otherwise same specifications as Coupe.

BAKER IMPERIAL. $1200.

Imperial; price, $1200; other specifications, s for the Baker Stanhope.

BAKER ELECTRIC MODEL I. $4000.

Baker Electric Model I, with brougham or landaulette body; $4000; motor, 6 H. P., 4-pole, series wound, located in the front of the chassis, in special cradle; overload capacity, 300 per cent.; battery, 40 80-volt, 140-ampere hour Exide cells, weighing complete, 1400 lbs.; drum controller, continuous torque system, giving 6 speeds forward, 3 reverse; drive by Renold silent chain to countershaft and by shaft and bevel gear to the rear live axle; tubular front axle; 34-inch artillery ball-bearing wheels, fitted with 4-inch tires on the front and 4½-inch at the rear; prest steel frame; semi-elliptic springs, front, 40 inches long by 2 inches wide, 8 leaves; rear, 44x2 inches, also 8 leaves; internal and external brakes on rear wheels, operated by pedal and hand levers. Special features: high speed and large mileage on single charge; batteries in series at all speeds; no sparking when changing speeds. With brougham or landaulette body, $4000.

Pope-Waverley Electrics.

Made by the Pope Motor Car Co., Indianapolis, Ind.

POPE-WAVERLEY MODEL 70 VICTORIA COUPE. $1900.

Pope-Waverley Model 70 Victoria Coupe; motor, Pope-Waverley design, double overload capacity; noiseless herring-bone gearing; side lever steering; 2 foot brakes and 1 electric brake; batteries, 30 cells of 11 P. V. Exide or 11 C. B. National, 10 cells in front and 20 in the rear, in compartments; artillery 30-inch wheels; 3-inch front tires, 4-inch rear tires; wheel base, 7 feet 5 inches; price, with removable coupe top, $1900; with leather top, $1700; with both, $2000.

Digitized by Google

POPE-WAVERLEY MODEL 65 STANHOPE. $1500.

Pope-Waverley Model 65 Stanhope; general specifi-
cations of the chassis the same as Model 70 Victoria
Coupe; buggy top will be furnished if desired; wheel
base, 5 feet 10 inches.

POPE-WAVERLEY MODEL 60 SURREY. $1750
WITHOUT TOP.

Pope-Waverley Model 60 Surrey; 2 special Pope-
Waverley motors of double overload capacity; speed,
5 to 15 miles per hour; battery, 42 cells of 9 V. P.
Exide or 9 C. B. National; 30-inch wheels, with 3½-
inch front and 4-inch rear tires; wheel base, 7 feet
6 inches; with extension leather top, $1900; other
chassis specifications similar to the other models.

POPE-WAVERLEY ELECTRIC MODEL 30 STATION
WAGON. $2000.

Pope-Waverley Model 30 Station Wagon; 2 special
Pope-Waverley motors, double overload capacity;
speed, 5 to 15 miles per hour; side lever steering;
battery, 41 cells of B. V. Exide or 11 C. B. National;

POPE-WAVERLEY MODEL 67 VICTORIA
TON, WITHOUT TOP, $1525.

POPE-WAVERLEY MODEL 26 CHELSEA.
OUT TOP, $1400.

Pope-Waverley Model 26 Chelsea; wheel b
feet 8 inches; general chassis specifications the
as Model 70 Victoria Coupe; with leather top,
with removable coupe, $1700; choice of side
or centre lever steering is given.

POPE-WAVERLEY MODEL 69 RUNABOUT,
WITHOUT TOP.

Pope-Waverley Model 69 Runabout; speed, 5
miles per hour; wheel base, 6 feet; general sp
tions otherwise same as Model 70 Victoria Pl
with leather top, $1225.

SAYERS & SCOVILLE TRUCK. $2500.

ers & Scoville commercial cars; any type of body ied to order; 4-cylinder, vertical, air-cooled mo- 4 by 4, 25 H. P., under the front seat on a rame; mechanically operated valves on one side on top; jump spark ignition from storage, dry and magneto; mechanical lubrication; multiple clutch; 3-speed sliding change gear on Timken bearings, direct on the high; side chain drive ad 2¼-inch square section rear axle; front axle, ch I-section; wheel base as required; 3½-inch 32 or 34-inch wheels on Timken roller bear- wood and steel frame, steel sub-frame; semi- lc front springs; platform rear springs; screw ut steering gear; 2 counter shaft brakes and 2 acting band brakes on the rear wheels; change lever is under the hand wheel; gasoline tank on lash; complete weight, 3000 lbs.; paying load ity, 1½ tons; equipment: full set of tools, , etc.; price, $2500. Special features: no side ; single control. Described in our October, 1907, page 222.

Mitchell Gasoline Commercial Car.

by the Mitchell Motor Car Co., Racine, Wis.

MITCHELL TRUCK. $2000.

hell Truck, with open or closed type of body; $2000; 4-cylinder, vertical, water cooled, 4-cycle, bore and stroke, 20 H. P. motor, set in front hood on sub-frame; mechanical valves; babbitt shaft bearings; 2 brass and 1 babbitt cam shaft gs; ignition current dry batteries and magneto; nical oiler under hood; leather faced cone ; sliding change speed gear; 3 speeds forward everse, direct on high, operated by side levers, ed in babbitt bearings; worm gear drive; I- front axle; 30 by 3-inch front tires and 30 by ch rear tires; front ball wheel bearings; wheel 110 inches; prest steel main and sub-frame; elliptic front springs, 39½ by 1¾-inch, 8 leaves, nt, and triple-action, 41 by 2 inches, 11 leaves, springs; irreversible steering gear; internal ex- g brakes on rear wheels operated by hand and external contracting operated by foot ; spark and throttle levers on steering post; ns capacity; 15-gallon gasoline tank under seat; t. 2300 lbs.; equipment: side oil lamps and com- set of tools. Described November, 1907, page 275.

yer-Miller Gasoline Commercial Cars.

ball bearings; side chain drive, 2½-inch square r axle, I-beam front axle; 34 by 4-inch front tire

FRAYER-MILLER 3-TON TRUCK.

36 by 3½-inch twin tires in rear; roller wheel bea ings; wheel base, 112-inch; 6-inch channel ir frame, and 4-inch channel sub-frame; semi-ellipt springs in front, 39½ by 3-inch, 9 leaves, and pla form, 39½ by 3-inch, 10 leaves, in rear; irrevers ble steering gear; internal and external brakes rear wheels and differential brake on counter shaf control on top of steering wheel; 15-gallon gasoli tank on dash; weight 3800 lbs.; equipment: one hor 2 side lamps, tail lamp, tool kit and wrenches.

FRAYER-MILLER 5-TON TRUCK.

Frayer-Miller 5-ton truck fitted with body as o dered; 4-cylinder, vertical, 50 H. P. air cooled moto 5½ bore and 5½ stroke; 130-inch wheel base; spring semi-elliptic, 40 by 3-inch, 14 leaves, in front a platform type, 44 by 3-inch, 18 leaves, in rea weight, 4200 lbs.; 20-gallon gasoline tank on das all other specifications are the same as for the 3-t truck.

Hinde & Dauch Gasoline Commercial Car

Made by Hinde & Dauch, Sandusky, Ohio.

HINDE & DAUCH COMMERCIAL CAR. PRICE $80

Hinde & Dauch detachable top commercial ca single cylinder, horizontal motor, water-cooled, cycle, 4¾x5½-inch, 8 H. P., located under the body mechanical valves; nickel Babbitt crank shaft an cam shaft bearings; jump spark ignition by dry ba tery; positive lubrication; individual clutch, chang speed, giving 2 speeds and reverse, direct on the high

RELIANCE MODEL F, 2-TON TRUCK CHASSIS, $2500.

Reliance Model F, 2-Ton Truck, with freight or passenger body; price of chassis, $2500; 2-cylinder, vertical, water-cooled, 2-cycle, 5⅛-in. bore, 5-in. stroke, 30 H. P. motor, set under front seat, on four-point suspension; babbitt crank shaft bearings; jump spark ignition, from storage and dry cells and magneto; mechanical lubrication; cork inserted cone clutch; 4-speed progressive change speed gear, direct on high, mounted on ball-bearings; chain drive; 32x4-inch tires; semi-elliptic springs; worm and sector steering gear; internal and external brakes; weight of chassis, 3400 lbs.; 20-gallon gasoline tank, located under seat; equipment, tools, lamps and horn.

Reliance Model G, 2½-ton Truck; price of chassis, $2750; weight, 3600 lbs.; all other specifications same as for the 2-ton truck.

RELIANCE MODEL H, 3-TON TRUCK CHASSIS, $3500.

Reliance Model H, 3-Ton Truck; price of chassis, $3500; 3-cylinder, vertical, water-cooled, 2-cycle, 5⅛x 5, 45 H. P. motor, set under seat, on four-point suspension; tires, 5 inches front, 3½ inches twin rear; 130-inch wheel base; weight, 4500 lbs.

Reliance Chassis Model F and G are furnished with the following bodies: Model K combination passenger and baggage body; capacity, 12 passengers and 1500 lbs. freight; Model I, 22-passenger sight-seeing body; Model L, 26-passenger sight-seeing body, with elevated seats; Model M depot wagon, passenger capacity, 16-18, drop windows, seats and back upholstered; model H, 22-passenger sight-seeing body, seats of wood, finished, not upholstered.

RELIANCE MODEL E, BODY ON MODEL H CHASSIS.

Models G and H Chassis are furnished with the following bodies: Model D truck body, size of bed, 13 feet by 6 feet, sideboards slant; Model G, light express body, size of bed 10 feet 6 inches by 4 feet; Model F truck body, sideboards detachable, size of bed 13x5 feet; Model E, heavy stake detachable sideboards, size of bed, 13x5 feet inside; also made in 10 feet 6 inches by 5 feet size for light work.

AUTO CAR 5-TON GASOLINE TRUCK, $4

selective sliding change speed gear, on Timken bearings, three speeds forward, direct on high, ated by lever; double chain drive; 2¾-inch rear axle and 2¾-inch I-section front axle; tir 6-inch in front and 36x7-inch in the rear, on T roller-bearings; wheel base 120 inches; main of armored steel and sub-frame of channel springs half-elliptic, 3-inch wide in front, and form type, 3-inch wide, in rear; worm type, irr ble steering gear; gasoline capacity 20 gallons located under driver's seat; weight, 6500 lbs.; ment consists of 2 brass side oil lamps, 1 searc 1 tail light and 1 horn. This chassis is also fu with a 40-passenger sight-seeing body.

AUTO CAR 20-PASSENGER GASOLINE B $3500.

Auto Car 20-passenger gasoline brake; price seats crosswise; 4-cylinder, 35 H. P., vertical, cooled motor, located in front, on three-point sion; cylinders 4 11-16-inch bore by 5½-inch mechanical inlet valves; crank and cam shaft b of Parsons white brass; jump spark ignition, b age and dry cells; magneto or dynamo furnished mechanical pump lubrication; cone clutch; change speed gear, three speeds, direct on high ated by lever; Timken roller-bearings in tr sion case; double chain drive; 2-inch square de axles and I-beam front axles; tires, 36x4-inch i 36x5-inch in rear; Timken roller wheel bearin mored wood main frame and channel iron sub springs, half-elliptic, 2½-inch in front, and p springs, 2½-inch, in rear; worm type steerin internal expanding brakes on rear wheels a emergency brakes on jack shaft; weight, 500 gasoline capacity, 20 gallons, tank located und er's seat; equipment, 2 brass side lamps, 2 lights, horn and tail light.

, 12-14 H. P. motor under seat on 4-point sus-
on; mechanical valves in head; jump spark ig-
from dry cells; mechanical oiler; friction
mission, 5 speeds; double chain drive; 30x3-inch
wheels on Hess-Bright bearings; 88-inch wheel

WALTHAM MODEL 178 C, $1450.

prest steel frame and sub-frame; elliptical
gs, 33 inches long front, 34 rear, 6 leaves;
steering; internal expanding brakes; carrying
ity, 1000 pounds; weight, 1600 pounds; 10-gal-
gasoline tank on dash; equipment, oil lamps,
and tools; price, $1450.

THAM MODEL 178 B, SCREENED WIRE EX-
PRESS WAGON, $1425.

tham Model 178 B, screened wire express
; furnished on same chassis as Model 178 C;
elliptic springs front and full elliptic rear;
t, 1500 pounds; price $1425.

THAM MODEL 178 A, LIGHT DELIVERY,
$1425.

tham Model 178 A, light delivery; furnished on
chassis as Model 178 C; semi-elliptic springs

WALTHAM MODEL D C, LIGHT DELIVERY
$650.

lever on left side; internal expanding brakes; carry
ing capacity, 600 pounds; weight, 750 pounds;
gallon gasoline tank at extreme rear of body; wit
tools, price $650.

WALTHAM MODEL 178 D, $1375.

Waltham Model 178 D, open delivery; furnished o
same chassis as Model 178 C; weight 1400 pound
price, $1375.

WALTHAM MODEL 188, DEMOCRAT WAGO
$1400.

Waltham Model 188, Democrat wagon; furnished o
same chassis as Model 178 C; semi-elliptic sprin
front and full elliptic rear; carrying capacity 10
pounds or 4 or 6 passengers; weight, 1475 pound
price $1400.

Waltham 1908 cars described in our Decembe
1907,, issue. Page. 96.

Knox Gasoline Commercial Cars.

Made by the Knox Automobile Co., Springfield, Mas

rame, channel steel, 5 inches by 2.06 inches; sub-rame; angle steel; 3-point suspension to main frame; emi-elliptic springs, front and rear; front, 40; rear, 0 inches; hand wheel steering, nut and screw gear; edal operating jack shaft brake; lever operating ear hub brakes; spark and throttle control levers; 8-gallon tank under driver's seat; weight, complete, 000 lbs.; paying load, 3 tons; price, with horn, dometer, jack and full set of tools, $3700.

KNOX MODEL D-3 TRUCK. $2450.

Knox Model D-3 truck, with stake body; 2-cylinder, pposed, air-cooled motor, 5 by 7, 16-20 H. P.; jump park ignition from dry cells; lubrication by oil ump; planetary change speed gear, giving two speeds orward and one reverse, direct on high, by friction isc clutch, hand lever operated; drive by chain to lve 2½-inch nickel steel axle; front axle, I-section teel; 96-inch wheel base; 32-inch wheels on Timken oller bearings, 3¼-inch tires; angle steel frame, no ub-frame; longitudinal side springs, extending from ront to rear axle; wheel steer; foot brake on trans-nission, side lever to rear axle brakes; 12-gallon gas-line tank under the driver's seat; weight, complete, 300 lbs.; paying load, 1¼ tons; equipment: side amps, odometer, horn, jack and full set of tools, 2450.

KNOX MODEL D-6 TRUCK. $2800.

Knox Model D-6 truck; express body; 2-cylinder, hor-zontal, opposed, air-cooled, 5 by 7, 16-20 H. P. motor nder body; 4-point suspension to sub-frame; auto-natic intake valves; crank shaft bearings of bab-itt, ball bearing cam shaft; jump spark ignition from ry cells; mechanical lubrication from 6-feed oil ump; friction disc clutch; 2-speed and 1 reverse plan-tary change gear on phosphor bronze bearings, direct n the high, operated by hand lever; double chain rive to dead 2½-inch square section steel axle; front xle, 4 by 2½ channel steel; 100-inch wheel base, 34 nch wheels on Timken roller bearings; 3½ front tires, -inch rear; channel steel frame, 4 inches by 1.65; ngle steel sub-frame; 3-point suspension to main rame; semi-elliptic springs, front, 40 inches, rear, 6 inches; steering gear, nut and screw type; foot rake on transmission, hand brake on rear wheels; eparate spark and throttle levers; 18-gallon gas-line tank under driver's seat; complete weight, 3800 bs.; paying load, 1½ tons; equipment: horn, oil ide lamps, odometer, jack and full set of tools; price, 2800.

Commerce Gasoline Trucks.

Made by the American Machine Mfg. Co., Beaubien and Champlain Sts., Detroit, Mich.

change gear, mounted on Hess-Bright bearings; chain drive to 3-inch solid square section rear front axle 2½ I-section; 130-inch wheel base; 3 front wheels, with 5-inch tires; 36-inch rear w with 8-inch tires; wheels on Timken roller bea semi-elliptic springs front and rear; enclosed gear steering; brakes internal and external on wheels and on countershaft; spark and throttle trol on steering wheel; 30-gallon gasoline tank, of radiator; weight complete, 8400 lbs.; paying capacity, 5 tons; equipment, 3 lamps, tool bag, etc.; price, $4500.

COMMERCE MODEL A GASOLINE TRUCK.

Commerce Model A Gasoline Truck; any ty body; 4-cylinder, vertical, water-cooled, 4¾x4 H. P. motor, under the driver's seat, mounted 9-point suspension; valves on one side and m ically operated; Parson's white brass crank sha cam shaft bearings; jump spark ignition from batteries; mechanical lubrication from 5-feed also splash; 3 disc metal clutch with cork inse speeds and 1 reverse, selective, change speed on roller bearings; double chain drive to dead 2 square rear axle; front axle 2½-inch I-section; 1 wheel base; 36-inch rear wheels, with 5-inch tir inch front wheels, with 4-inch tires, all on bearings; Carnegie 5-inch steel frame; semi-front springs, 14 leaves; platform rear sprin leaves; spur gear steering; 2 contracting band on countershaft; 2 expanding brakes on th wheels; 25-gallon gasoline tank, on top of ra weight complete, 5800 lbs.; paying load, 3 tons; ment, lamps, tool kit, etc.; price, $3500.

Hennegin Air-cooled Commercial Ca

Made by the Commercial Automobile Co., Chica

HENNEGIN MODEL A DELIVERY. $650

Hennegin Model A Delivery, No. 1; 2-cylin cycle, horizontal, air-cooled, 4½x4, 12-14 H. P. under foot-boards, on three-point suspension; m ical valves in cylinder head; adjustable bronze shaft bearings, 5 and 8 inches, respectively; cam shaft bearings; jump spark ignition, fron age battery, dynamo if desired; sight feed m cal lubrication; no clutch; friction transmiss roller bearings, operated by hand and foot, leve set positions for speeds; roller side chain tubular trust axle; tubular front axle; 1½ inc rubber tires; hard bronze, grease-packed wheel ings; 87-inch wheel base; channel steel fram sub-frame; full elliptic springs front and rear;

ler, horizontal opposed water-cooled motor, ther-
circulation, 5½ by 5, 22 H. P. motor under the
on 3-point suspension; mechanically operated
s in chambers on cylinders; crank shaft and
shaft bearings of babbitt; jump spark ignition
dry batteries; mechanical lubrication by Hill
sion oiler; self-contained cone clutch; 2 speeds
rd and 1 reverse sliding change gear on bab-
bearings, direct on the high; shaft drive to
ed live rear axle, 1⅜ nickel steel; front axle,
ch square section; 90-inch wheel base; 32-inch

OULES MODEL F GASOLINE DELIVERY WAGON. $1800.

wheels with 3-inch tires, 34-inch rear wheels, 3½-inch tires; wheels on Timken bearings; steel frame, no sub-frame; ¾ elliptic springs, and rear; 42 by 2 inches, front, 7 leaves; rear, aves; irreversible worm and segment steering internal and external drum brakes on rear ls; spark and throttle lever control on steering n; 10-gallon gasoline tank under the seat; t, complete, 2600 lbs.; carrying capacity, 1500 equipment: 3 lamps, horn and tools; price, $1800. al features: ample power, accessibility of clutch transmission without removing load; engine at ront under hood.

LES MODEL B SIGHT-SEEING CAR. $2500.

les Model B sight-seeing car; 4 seats, set wise, passenger capacity, 14; wheel base, 105 s; specially powerful brakes; general chassis fications similar to Soules Model F delivery wag- Price, $2500.

frame, no sub-frame; ¾ elliptic springs front a rear; 42 by 2 inches, front, 8 leaves; rear, 9 leave also half elliptic supplementary spiral springs on t rear; worm and segment irreversible steering gear; i ternal and external brakes on rear wheel drums; spa and throttle lever on steering column; 15-gallon gas line tank on the seat; complete weight, 2800 lbs paying load capacity, 2500 lbs.; equipment: 3 lamp horn, tools; price, $2000; special features: acces bility of mechanism without removing load; body feet long behind seat; 55 inches wide.

Hatfield Gasoline Commercial Vehicles

Made by the Hatfield Motor Vehicle Co., Miam burg, O.

HATFIELD LIGHT GASOLINE DELIVERY WAGO $700.

Hatfield special body gasoline delivery wagon; cylinder, opposed, air-cooled motor, 4x4, 12 H. located under the seat on 3-point suspension; au matic inlet valves; crank shaft and cam shaft be ings Parson's white bronze; jump spark ignition fr dry cells; force feed lubrication; friction drive mou ed on roller bearings, giving any number of spee forward and reverse, operated by single side leve drive to rear wheels by side chains; wheel base 1 inches; large wheels, fitted with 1¼-inch solid tire wheel bearings Timken roller; frame, wood; full liptic springs front and rear, front 37½ inches lo width, 2 inches, 6 leaves; rear, 36 inches long, inches wide, 6 leaves; steering by Hatfield chain a sprocket; 2 band brakes, spark and throttle on ste ing post; 8-gallon gasoline tank in the dash; co plete weight of car, 1100 pounds; paying load, 8 pounds; price, $700, equipped with 2 lamps a tools.

Gifford-Pettit Gasoline Commercial Ca

Made by the Gifford-Pettit Mfg. Co., Chicago, Il

GIFFORD-PETTIT MODEL A COMMERCIAL CA $3500.

Gifford-Pettit Model A; 4-cylinder, vertical, wat cooled, 4-cycle, 4¾x6, 30-35 H. P. motor located o front axle on four arms to sub-frame; valves op ated from cam shaft in engine case on opposite si of T head cylinders; bronze babbitt lined crank sh bearings; bronze cam shaft bearings; double ignit system, jump spark with storage battery, make a break with Bosch low tension magneto; McCord elev force feed oiler; cone clutch leather faced; progr sive, sliding change gear on bronze bearings, 3 spe forward, 1 reverse, direct on high, operated by lever; chain drive; 2½ in. square dead rear axle, in. I-beam front axles; wheels on Timken ro bearings; wheel base, 120 ins.; frame, 16 ft. 8 in sub-frame, 10 ft.; 5 in. single tires front, 3½ t tires rear; semi-elliptic springs, 50 ins. long, 3

inch, 14 leaves, on the end; 2 3½ by 16-inch in-
l expanding brakes, others same as 12-passenger
au; 18-inch hand wheel; weight, 7300 lbs. Man-
n 5-ton truck; body to suit, up to 8 by 18 ft.;
e located in front; 126 to 180-inch wheel base;
6-inch front tires, and 36 by 4-inch twin, rear;

MANHATTAN 5-TON BARREL TRUCK.

e sweep semi-elliptic front springs, 48 by 3-inch,
aves, and platform rear springs, 49 by 3-inch, 16
s. on sides, and 40½ by 3-inch, 15 leaves on end;
20-inch steering wheel; 2 3½ by 16-inch internal
nding rear hub brakes; weight, 7800 lbs.

ANHATTAN 22-PASSENGER ENCLOSED BUS.

hattan 22-passenger enclosed bus; straight line
rear axle, 2¾-inch square; front axle, 2½-
square; tires, 36 by 6-inch front; 36 by 4-inch
rear; wheel base, 168 inches; 5-inch channel
frame, 44 inches wide; half elliptic front springs,
2½-inch, 16 leaves; rear springs, platform type,
2½-inch, 16 leaves, on sides, and 40½ by 2½-
15 leaves on end; weight, 10,000 lbs.; tread, 72
s. Described in our February, 1908, issue, page

Miller Gasoline Commercial Cars.

by Miller Motor Car Co., Bridgeport, Conn.

er Model D; 12 passengers; 4 cross seats; 2-
er, horizontal, 4-cycle, water-cooled by pump
an, 5½x6, 20-24 H. P. motor, cross-wise under
on channel steel sub-frame; mechanically-op-
l valves; crank shaft and cam shaft bearings,
n's white metal; jump spark ignition, from

feature: Fool-proof transmission.

This chassis is fitted with 1-ton delivery body, pan
or platform, called Model E.

MILLER MODEL B 30-PASSENGER CAR, $550

Miller Model B 30-Passenger Car, 6 cross seats;
cylinder, vertical, water-cooled by pump and fan,
cycle, 5¾x6, 45-55 H. P. motor, in front, under hoo
on angle iron sub-frame; mechanical inlet and e
haust valves on opposite sides of engine; 5 crank sha
and 5 cam shaft bearings; jump spark ignition, fro
storage and dry cells, magneto if desired; positiv
pump lubrication to crank case; Hele-Shaw multip
disc clutch; 2-speed and reverse change gear,
phosphor bronze bearings, direct on both speeds, ope
ated by two levers; shaft drive to jack shaft, tw
chains to rear wheels; rear axle, 2½-inch square har
mered steel; front axle, 2¼ inches; wheels on Stan
ard roller bearings; 3-inch twin tires front, 3½-in
rear; wheel base, 144 inches; 5-inch ship chann
steel frame, 2½-inch angle iron sub-frame; semi-elli
tic springs, 36 inches long front, 2½ inches wide,
leaves; 48 inches long rear, 2½ inches wide,
leaves; irreversible worm and sector steering;
ternal expanding brake on rear hub drums and o
service brake on shaft; French system of contro
capacity, 30 passengers, or 3½ tons; weight, 66
lbs.; 28-gallon gasoline tank, under front seat; equi
ment, 2 oil dash lamps, 2 gas lamps, 1 tail lam
and set of tools. Special features: ease of contr
and system of transmission. Price, $5500.

This chassis is also furnished with stake platfor
body; springs have 12 leaves front, 16 rear; contro
gas and spark on top of wheel; 25-gallon gasoli
tank; capacity, 3 to 5 tons; weight, 6000 lbs. a
proximately; same equipment as Model B.

Gaeth Gasoline Commercial Cars.

Made by the Gaeth Automobile Co., Cleveland, Ohi

GAETH TYPE K COMMERCIAL WAGON, $1500.

Gaeth Type K commercial wagon, regular delive
body or body built to order; single-cylinder, horizo
tal, 4-cycle motor, bore 5¾-inch, stroke 7½-inch, wate
cooled by thermal circulation, 12-15 H. P. motor, locat
under the front footboards on cross members of t
frame; valves mechanically operated at the ends of t
cylinder; special Babbitt cam shaft and crank sha
bearings; jump spark ignition from 2 sets of d
cells; force feed lubrication; contracting band clutc
planetary change speed gear, giving 2 forward and
reverse speed, operated by hand lever; drive by doub
side chain; solid steel rear axle; front axle tubula

Digitized by Google

H. P. motor; set under body on three-point suspen-
on; cylinders, 5-inch bore and stroke; mechanically
erated valves; bronze crank and cam shaft bearings;
mp spark ignition by storage battery; Lavigne oiler;
anetary transmission, two-speeds forward; multiple
sc clutch on the high speed; operated by hand lever,

RAPID MODEL E 182, $2500.

d mounted in bronze bearings; side chain drive;
4-inch front and rear axle; 3-inch solid endless
bber tires; Timken wheel bearings; 100-inch wheel
se; angle steel main frame; 8-inch oak sub-frame;
ll platform springs front and rear; gear and sector
eering gear; internal expanding brakes on rear hubs;
ark and throttle control on steering post beneath
eering wheel; weight, 3100 lbs.; 15-gallon gasoline
nk in dash; equipment: 2 oil side lamps, tail lamps,

MODEL E 72, $1750.

rn and tools. Rapid Model E 182, 12-passenger Pull-
an car, price $2500; 90-inch wheel base; 9-inch oak
b-frame; weight, 3950 lbs.; equipment: 2 oil side
mps, tail lamps, horn, 7-inch mirror searchlight,
nerator and tools; all other specifications same as
Model E 14. Chassis used for Model E 14 is also
rnished for Models E 182, E 132, E 152, E 21, E
E 72, E 62 and E 222.

RAPID MODEL E 145, $4000.

Rapid Model E 145, 25-passenger Pullman, price
000; 4-inch solid endless tires; full platform springs,
¼ by 2¼-inch front and rear, 7 leaves, in front,
d 8 leaves in rear; weight, 4600 lbs.; all other
ecifications same as for Model E 95.

Rapid Model E 152, 16-passenger car; panelled
dy; 2-cylinder, horizontal, water-cooled, 4-cycle, 5x
24 H. P. engine under body on three-point suspen-
n; mechanical valves, facing crank case; large

and rear, wheel on Timken bearings; 3 in. solid ss rubber tires; wheel base, 90 ins.; heavy angle frame; oak sub-frame; full platform springs; sector steering; internal hub brakes; throttle spark levers on steering column, forward and re- by foot pedals, high speed by hand lever; ca- y, seats for three attendants and 2 full-sized gency cots, and 3 persons on driver's seat; 15 galosine tank in dash; weight, 4012 lbs.; price, , including 2 oil side lamps, tail lamp, 11 in. and complete tool outfit.

oppock 2-Cycle Gasoline Commercial Cars.

by the Coppock Motor Car Co., Decatur, Ind.

OCK MODEL A, 1-TON TRUCK; CHASSIS, $2500.

pock Model A, 1-ton gasoline truck; price of s, $2500; 2-cylinder, 2-cycle, water-cooled, 4½x 20-24 H. P. motor in front; ignition current orage battery with apple generator set; positive feed lubrication; cold prest nickle steel frame; eeds forward and reverse, progressive sliding e speed gear; internal expanding clutch with inserts; double-side chain drive; solid rubber 32x3½ ins. front and 32x4 ins. in rear; 87-in. base; 60-in. tread; 15-gal. gasoline tank; I- nickle steel front axle; brakes, contracting on and on differential; equipment: two electric ghts, complete set tools and horn; weight, 2900 the following bodies are furnished on this chas- platform type body; 16-passenger sight-seeing enclosed panel body for department stores; 10- nger transfer type; slat body for furniture or s top for piano delivery.

iselbach Gasoline Commercial Cars.

by the A. D. Meiselbach Motor Wagon Co., North Milwaukee, Wis.

MEISELBACH 1-TON TRUCK, $2000.

elbach 1-ton truck; 2-cylinder, horizontal, 6x4¼, P., water-cooled motor in front under seat; g double mitre friction drive transmission; 34-in. artillery wheels front and rear, fitted with 3½- lid Firestone rubber tires; I-beam front axle, Timken roller bearings, 1¾-in. square dead xle, with Timken roller bearings; springs, 2x38 10 leaves; Whitney or Baldwin double-side chain 10-gal. gasoline tank; wheel base, 84, 96 and s., according to body; 60 ins. gage; weight of s, 3800 lbs.; price of chassis, $2000, fitted with yle body.

elbach 2-ton truck; Firestone 4-in. solid rub- res; Timken roller 2-in. I-beam front axle and

FRANKLIN MODEL J 16 H. P. TRUCK.

Franklin Model J 16 H. P. truck; fitted with stal body; 4-cylinder, air-cooled, vertical, 3¾-in. bore a stroke; mounted in front on angle irons to sills und driver's seat; mechanically operated valves by rock arms and push rods in top of cylinder; die cast ba bitt crank and cam shaft bearings; jump spark ign tion, dry cells; force feed lubrication and splas multiple disc clutch; sliding transmission; 3 forwa speeds and reverse, operated by hand lever, mount in ball bearings; shaft drive; semi-floating rear ax and tubular front axle; solid rubber tires; 90-i wheel base; ash sill and cross bars bevel steeri gear; double-acting Raymond brakes on transmissio operated by foot pedal and two double-acting Ra mond brakes, one on each rear hub, operated by si hand lever; 8-gal. gasoline tank under seat; equi ment; two oil side lamps, complete tool equipme and jack.

Logan Gasoline Commercial Vehicles.

Made by the Logan Construction Co., Chillicothe,

LOGAN GASOLINE TRUCK, MODEL T, $2250.

Logan Gasoline Truck, Model T; 4-cylinder, vertica air-cooled, 4x4-inch, 20 H. P. motor, under the sea mounted on sub-frame; overhead cam shaft and valv in the heads; crank shaft bearings, 3 of white bras cam shaft bearings, 3 of bronze; jump spark ignitio from storage battery and dry cells; Kinsey mechanic lubricator, expanding band clutch; 3-speed, sliding selectively operated change speed gear, mounted o Hess-Bright and Timken bearing, direct on the high double side chain drive; rear axle, 1¾ square, front section; 96-inch wheel base; 32 inch wheels, on Tim ken bearings; 4-inch tires front and rear; 3-inch cha nel frame; sub-frame, 2x3-inch angle steel; full ellip tic front springs, 38x2 inches, 7 leaves; rear, pla form, 36x2½, 9 leaves; screw and nut steering gea brakes, band on rear hubs, also on jack shaft drums control, spark and throttle levers on steering po and foot clutch lever; 11-gallon gasoline tank, und seat; weight complete, 4000 lbs.; 1 ton paying loa capacity; equipment, oil lamps, horn and tools; pric $2250.

Safir Gasoline Commercial Cars.

Imported by the Commercial Motor Car Co., Time Building, New York City.

SAFIR 5-TON TRUCK, $5000.

Safir 5-ton gasoline truck; price, $5000; 4-cylinder 4-cycle, vertical, water-cooled, 4 5-16-in. bore, 5½-i

Digitized by Google

HEWITT FIVE-TON TRUCK, CHASSIS, $4500. Hewitt 5-ton truck; any style body desired; 4-cylinder, vertical, water-cooled, 4-cycle, 4¼x5½, 30 H. P. motor located in front, 6 points on sub-frame; mechanical valves on one side; crank shaft bearings; babbitt, cam shaft bearings, bronze, jump spark ignition; force feed lubrication; fibre faced clutch; 4 speeds forward and reverse, planetary change gear on plain bearings; direct on high, operated by pedals; chain drive; dead solid rear axle; solid front axle; 36-inch tires; wheels on Timken bearings; wheel base, 138 inches; 9-inch prest steel frame and sub-frame, semi-elliptic springs, 40 inches long, 3½ inches wide, 15 leaves front; 48 inches long, 3½ inches wide, 17 leaves, rear; rack and pinion steering gear; internal expanding brakes; control by pedals to push; capacity, 5 to 7 tons; weight, chassis, 6800 pounds; 35-gallon gasoline capacity in tanks, in front and at side; equipment, 3 lamps and horn; price, chassis, $4500. Special features: Radiator spring suspended; special control. Described November, 1907, issue; page 282.

Lambert Friction Driven Gasoline Commercial Vehicles.

Made by the Lambert Motor Truck Co., Anderson, Ind.

LAMBERT MODEL C FRICTION-DRIVEN TRUCK. Lambert Model C friction-drive truck; motor, 4-cylinders, 35-40 H. P. Rutenber, cylinder, 4½ by 5-inch; friction change speed and direct chain to each rear wheel; jump spark ignition; foot ratchet brake on differential; internal expanding brakes on rear hubs; complete weight, 3500 lbs.; carrying capacity, 3000 lbs.

Sternberg Gasoline Commercial Cars.

Made by Sternberg Motor Truck Co., Milwaukee, Wis.

STERNBERG MODEL A TRUCK, PRICE OF

frame and 3-in. channel sub-frame, full springs, 38x2½ ins., 12 leaves in front, and elliptic, 40x3 ins., 12 leaves, in rear; adjustable and nut steering gear; double internal expa brakes on rear wheels; 3 tons capacity; weight lbs.; 20-gal. gasoline tank under seat; equip lamp, horn, storage battery and tools.

Plymouth Gasoline Commercial Ca

Made by the Commercial Motor Truck Co., Plym Ohio.

PLYMOUTH TRUCK, $2250.

Plymouth truck, price $2250, furnished with stake or side board body; 4-cylinder, 4-cycle, ve 43 H. P. brake test, water cooled, motor loca front, suspended by hangers; cylinders 4¾-inch by 5-inch stroke; mechanically operated valves; crank shaft and cam shaft bearings; jump spa nition by storage and dry cells; friction change gear on Hyatt roller bearings, operated by side friction drive, speeds from 2 to 25 miles per tires, 34 by 3 1-7-inch; 2-inch Timken square rear axle and Timken 2-inch I-beam front axle; ken bearings on wheels; wheel base, 103-inch; nel steel frame; elliptic springs front, 38-inch l 2¼-inch wide, 9 leaves, and platform springs by 2¼-inch wide, 10 leaves, 38 by 2¼-inch wi leaves, in rear; Barnes steering gear; double i expanding brake, 16-inch in diameter by 2½-inc in rear wheels; foot lever control; capacity 2 weight, 3900 lbs.; gasoline capacity, 15 gallons under seat; equipment: 2 front oil lamps, 1 tai and searchlight. Described in our December, issue, page 276.

Chase Air-cooled 2-Cycle Gasoline C mercial Cars.

Made by Chase Motor Truck Co., Syracuse, N

CHASE BUSINESS RUNABOUT, $750.

Chase business runabout, Democratic delivery 2-cylinder, vertical, air-cooled, 2-cycle motor, in front, under hood, and mounted on side f cylinders, 4½-inch bore by 5-inch stroke, 15 crank shaft bearings of bronze; jump spark ig 2 sets of dry cells; automatic self-feed oiler; etary change speed gear, 2 speeds forward, di high, operated by hand lever; plain change spee ings; side chain drive; square dead 1½-inch re and square 1¼-inch front axle; tires 40x1¾ solid; plain wheel bearings; wheel base, 84 wood frame; springs full elliptic, 32x1½ inc leaves, front and rear; worm and gear whee steering gear; brakes on rear wheel rims; spa throttle control on steering wheel; seating ca 4; 10 gallons gasoline capacity, tank located driver's seat; weight complete, 1400 lbs.; equi oil lamps and horn. Price, $2500.

Chase 2-3-ton stake or express body truck; 4-c

Digitized by Google

AMERICAN 5-TON TRUCK.

rican 5-ton truck; motor, 4-cylinder, vertical, bore, 6-in. stroke, 35-40 H. P.; jump spark igni- y storage batteries; flash and force feed lubri- ; spark, carburetor and governor levers on steer- olumn; 2 speed forward and reverse planetary nission, direct on high; bevel gear drive on nission shaft to jack shaft; side chain to rear s; irreversible steering gear, 20-in. hand wheels; n front axle; square rear axle; steel channel, iveted frame; front springs, semi-elliptic; rear s, 3 semi-elliptic platform type; 36-in. wheels; rubber tires; 118-in. wheel base; 20-gal. gaso- tank; brakes, regular brake operated by foot emergency brakes on drums on rear wheels; ng capacity, 6000 to 10,000 lbs.; equipment, 2 il lamps, tail lamp, horn and full set of tools. standard unless otherwise specified. This chas- also fitted with 2-ton body. Described in our ber 1907, page 286.

rnational Gasoline Commercial Cars.

by the International Motor Car Co., Philadelphia, Pa.

INTERNATIONAL TRUCK.

rnational truck; motor, 4-cylinder, 4-cycle, water- , 5-inch bore and stroke, 40 B. H. P., at 1000 M.; spark and throttle control levers on top quadrant at the driver's right; steering by hand ; wheel base, 146 inches; gage, 57½ inches. The feature of truck is the front wheel drive, which Renold Silent Chain to a horizontal shaft which s a disc. The friction wheel shaft is vertical, bevel gear to horizontal shaft and to a divided rshaft bevel balance gear drum, with side to the front driving wheels. The rear part of the is ordinary wagon construction. Load capacity ,000 lbs.; weight of truck 9500 lbs.; 2¾-inch forging rear axle; rear wheels, 56 by 3¾-inch tire. Described in this issue, page 242.

orthern Gasoline Commercial Cars.

e by Northern Motor Car Co., Detroit, Mich.

speed, direct on high, planetary change speed gea mounted on bronze bearings, operated by lever o steering column; shaft drive; tubular front and rea axles; 32x4-in. cushion tires; Timken wheel bea ings; 106-in. wheel base; angle steel frame; springs 36x2, 7 leaves, ¾ elliptic in front and full ellipti in rear; bevel steering gear; camel hair lined, ex ternal contracting brakes; spark and throttle contro levers on steering columns; capacity, ½ to 1 ton 20-gal. gasoline tank under front seat; equipment 3 lamps, horn, tools and tool box; weight, 2400 lbs. special features; no mechanism of any kind unde any part of body.

Cadillac Gasoline Commercial Cars.

Made by Cadillac Motor Car Co., Detroit, Mich.

CADILLAC MODEL M, DELIVERY, $1000.

Cadillac Model M, delivery; price, $1000; enclose delivery body; 1-cylinder, 4-cycle, 10 H. P., horizon tal, water-cooled motor, located under body, bolte to cross members; cylinder, 5-inch bore and stroke vertical, mechanically operated valves in cylinde head; Babbitt and bronze crank shaft bearings; jum spark ignition, dry cells; force feed lubricator; dis clutch; planetary speed change gear, 2 speeds forwar and reverse, direct on high, operated by side leve bronze bearings; chain drive; tubular front and rea axles; tires, 30 inches; ball wheel bearings; whee base, 76 inches; prest steel frame; semi-elliptic fron and rear springs; 35x1¾ inches, 7 leaves, in front 42¼x1¾ inches, 7 leaves, in rear; rack and pinio steering gear; constricting band brake on differentia spark and throttle levers on steering post; hig speed and reverse controlled by hand lever, low spee and brakes by foot lever; capacity, 600 lbs.; 7-gallo gasoline tank, under front seat; equipment include 3 oil lamps and horn.

Brush Gasoline Commercial Cars.

Made by the Brush Runabout Co., Detroit, Mich.

BRUSH RUNABOUT MODEL 2 A, DELIVERY WAGON, $600.

Brush delivery wagon; motor, 1 vertical, water-coole cylinder, 4-cycle, 4x4-inch, thermal circulation, 6 H P. motor, under the hood, on three-point suspension valves mechanically operated and located on the side ignition jump spark from dry cells; lubrication b crank case compression; metal-to-metal cone clutch

Digitized by Google

ARTERCAR MODEL C DELIVERY WAGON. $1400.

Cartercar Model C delivery wagon; price, $1400; 000 lbs. capacity; 2-cylinder, horizontal opposed, ater-cooled motor, 25 H. P., in front under hood; ½-in. bore, 4½-in. stroke, Lavigne oiler; 30x3½-in. ires; 96-in. wheel base; 15-gal. gasoline tank; Car-ercar friction transmission, operated by one side ever; front axle of the tubular type, rear axle, tubu-r divided type; Brown-Lipe differential, mounted on Iyatt roller bearings; semi-elliptic springs, 40 ins. ng in front, 48 ins. in rear; equipment: 3 oil lamps, ube, horn, mats, tire repair kit, battery box of prest teel with tray for small tools on running board.

Lindsley Commercial Gasoline Vehicles.

Iade by J. V. Lindsley Co., 2207 College Ave., Indianapolis, Ind.

LINDSLEY COMMERCIAL CAR. $500.

Lindsley commercial car, box body; capacity, 1500 bs.; 2-cylinder, vertical, air-cooled, 4¼ by 4⅛-inch, 4 H. P. motor under the seat; mechanical valves; am shaft and crank shaft bearings bronze; jump park ignition, dry cells; force-feed lubrication; fric-

pacity, 8 gallons; tank under seat; equipment: $500.

Standard Gasoline-Electric Comme Cars.

Made by the Standard G. E. Power Co., 50th Lancaster Ave., Philadelphia, Pa.

STANDARD G. E. TRUCK.

Standard gasoline-electric truck; 2-cylinder o motor; 2½ H. P. electric motor in front under d seat, cylinders, 5½-inch bore, 6-inch stroke; le faced cone clutch; 3 forward and 1 reverse gear; 42-inch rear wheels; control handle at ri driver's seat; 80 volt, 40 ampere hour electri tery; self-starting device; internal expanding on rear wheels; 5-inch channel iron frame; tr fitted throughout with roller or annular ball bea 3½-inch solid side wire tires in front, 4-inch ti rear; 96-inch wheel base; 60-inch gage; semi-e springs, 44 inches in front and 48 inches in rea gallon gasoline tank under seat; equipment in side lamps and tail lamp, fitted with incand globes, current being supplied from storage bat Special feature: The truck is driven by the ga motor. When the speed of the engine drops 1000 R. P. M. the motor takes current fro storage battery and its torque tends to kee engine up to its normal and effective working where it is capable of developing sufficient d power. When the gasoline engine is running 1000 rev. the motor automatically becomes a ge and supplies the batteries with current. The e motor does not drive the machine, but acts as ernor on the engine. Full description of this will be found in our February, 1908, issue, page

ple Gear Electric Commercial Cars.

le by Couple Gear Freight Wheel Co., Grand Rapids, Mich.

PLE GEAR, MODEL E-2, PANEL BODY EXPRESS WAGON, $2400.

ple Gear Moded E-2 Express Wagon; weight of ry, 1600 lbs.; 80 volts, 35 amperes; Couple Gear ay type controller; 2¼-inch nickel steel rear Sarvin type rear wheels and bearings, Couple disc front wheels, on roller bearings; 2¼-inch tires in the rear and 3-inch rubber tires in ; springs semi-elliptic in front and rear; 38x2-s, 7 leaves, in front, and 44x2 inches, 6 leaves, coil auxilliary in rear; weight, 3500 lbs.; all specifications are the same as for Model A-2 body truck. Price, $2400.

PLE GEAR, MODEL ED-2, PANEL BODY EXPRESS WAGON, $2500.

ple Gear, Model ED-2, express wagon; 40 cells, olt, 35-ampere, National Exide or Universal bat- weight, 1600 lbs.; 3½-inch tires; semi-elliptic gs front and rear, 38x2 inches, 7 leaves, in front,

2800 lbs.; 88 volts, 63 amperes; 5 speeds forward, reverse; Couple Gear drive to both sides of whee trussed type axles front and rear; disc wheels on roll bearings; tires 4-inch dual on all wheels; steel I-bea frame; semi-elliptic front and rear springs, 43x3 inche 20 leaves, in front, and 43x3 inches, 19 leaves, rear; double-acting band brakes, operated by fo lever; complete weight of car, 10,000 lbs.; equipme includes seat, top and curtains, volt and ammete cyclometer, gong, lights and tools. Price, $5000.

Lansden Electric Commercial Car.

Made by the Lansden Co., Newark, N. J.

LANSDEN TYPE 36 EXPRESS WAGON, $2250.

The Lansden Type 36 chassis, fitted with Model open express body, with top; General Electric moto under footboard, on angle iron sub-frame, sliding fe on motor, 3 H. P.; Edison 60-cell, 50 ampere hou 75-volt battery, weight 850 lbs.; General Electric co tinuous torque, 3 speeds forward and 2 reverse, co troller; double side chain drive from countershaf single chain to motor; solid square forging rear a front axles; artillery type wheels; 32x2½-inch tire wood and steel plate frame; semi-elliptic sprin front and rear, dimensions according to load capacit internal expanding brakes on rear hub drums, operat by foot pedal; weight, 3000 lbs.; equipment, si lamps, horn or bell, tail lamp, top with curtain tools and odometer; price, $2250. This concern al builds other types of wagons, from 500 lbs. to tons capacity.

Pope-Waverley Electric Commercial Vehicles.

Made by the Pope Motor Car Co., Indianapolis, In

POPE-WAVERLEY MODEL 43 CLOSED DELIVER WAGON, $1800.

Pope-Waverley Model 43 Closed Delivery Wago double reduction; drive by double side chains; ba tery, 42 cells, 11 P. V. Exide or 11 C. B. Nations 32-inch artillery wheels in the front, 36-inch in t rear, fitted with 3-inch solid rubber tires; 2 h brakes and a countershaft brake; steering by han wheel, with sector and pinion; wheel base, 7 feet inches; body-carrying space, length, 5 feet 3 inche width, 3 feet 4 inches; length over all, 10 feet inches; bodies of any shape or design will be fu nished at extra cost; carrying capacity, 1200 lbs.

Baker Model N Commercial Electric

BAKER ELECTRIC MODEL N COMMERCIAL CHASSIS, $2300.

ontinuous drum type, giving 5 speeds forward and reverse; drive, Renold silent chain to countershaft nd double chain drive to rear wheels; forged rear xle, square section; I-section drop-forged front axle; rtillery wheels, on roller bearings; motor on annular all-bearings; tires, 34x3½-inch solid rubber; frame, rest steel; 40x2-inch semi-elliptic springs, front, 9 eaves; rear, 8 leaves; brakes, internal expanding on ear wheels, operated by pedal. Special features: unerslung battery; special patented battery cradle and ountershaft mounting. Price of chassis, $2300.

General Vehicle Electric Commercial Cars.

Made by General Vehicle Co., Long Island City, N. Y.

GENERAL VEHICLE MODEL 835.

General Vehicle police patrol wagon; weight, 5600 os.; General Electric motor, suspended from frame n cradle; 2.8 H. P., overload capacity, 100 per ent.; voltage 85, ampere 30; 4 speeds forward and reverse; chain drive, Morse, 1st reduction, Whitney, d reduction; Exide battery, 44 cells; wheel base, 07¼ ins.; gage, 64¾ ins.; channel frame; tires, x32 ins.; springs, half-elliptic, 40 ins. long, 2 ins. vide, 8 leaves, front, 9 rear; internal expansion brake perated by foot pedal.

GENERAL VEHICLE MODEL 2067.

General Vehicle Chatsworth 'bus; weight, 4400 os.; General Electric motor, suspended from frame n cradle; voltage 85, ampere 20; 4 speeds forward, reverse; chain drive, Morse, 1st reduction, Whitney,

GENERAL VEHICLE MODEL 830.

reverse; Morse chain drive, first reduction; Wh second reduction; 44-cell Exide battery; wheel 144 ins.; gage, 71½ ins.; channel frame; 7 tires front, 4x36-in. twin tires rear; half-e springs, 50 ins. long, 3 ins. wide, 13 leaves, 16 leaves, rear; two internal expanding brakes, ated by foot pedal.

Autocar Commercial Electric Cars

Made by the Auto Car Equipment Co., 77 Edwar Buffalo, N. Y.

AUTO CAR 24-PASSENGER ELECTRIC SIGHT ING CAR, $3150.

Auto Car 24-passenger electric sight-seeing price $3150; 2 Westinghouse motors; double drive; 2-inch square dead rear axles and 2-inch tion front axles; tires, 36x4 inches front, 36x5 rear; Timken roller wheel bearings; wheel bas inches; armored wood frame; platform spring inches wide; worm type steering gear; intern panding, foot-operated brakes; equipment, 2 e side lamps, 1 electric headlight, 1 electric tail and 1 horn.

AUTO CAR ELECTRIC AMBULANCE, $25

The Auto Car Electric Ambulance, 2 Westin motors; 4 speeds; double chain drive; 1¾-inch

TREMENDOUS GROWTH IN FAVOR OF TWO-CYCLE IDEA EXEMPLIFIED IN THE

Surely, the fact that our enlarged plant is running full force and turning out cars as rapidly as possible is ample evidence that there is an enormous demand for these two-cycle valveless cars.

Surely, the fact that our agents everywhere are crying for an increased allotment of Elmore cars is ample substantiation of this statement—that there is an enormous demand.

Surely, the fact is being demonstrated every day that the two-cycle idea is growing faster than the factory can keep pace. The reasons are many—here are a few of them:

Continuous turning power; absence of all valves; absence of all valve trouble; absence of all ignition trouble; low cost of up-keep.

Write for literature, but see an agent.

BREATHING PIPES FOR 2-CYLINDER OPPOSED MOTOR.

Brookville, Ind.

Will you please answer the following question: I own a 2-cylinder opposed 20 H. P. car. I tried to relieve the crank case from the compression so I could keep the engine cooler. I put in the crank case lid seven pipes, each pipe one and three-eighths of an inch bore, extending four inches above the plate. Now when I get on the road the air forces the oil thru the pipes against the seat. What would be your advice to prevent this? They are common gas pipes with no valves nor screens. How would a relief vent do, and how many must I have? Will a screen of a funnel shape in each pipe keep the oil back? Be so kind and answer this question as soon as possible. H. W. SUHRE.

How to let a 2-cylinder opposed engine breathe is a hard problem. There is usually a lot of oil flying around in the case and this is carried out by the outgoing air. Some device like a steam separator is the best means of stopping this. The principle is that the oil must be thrown against a wall where it can run back and where it is not likely to be so exposed to the air that it will again be pickt up. If you have room put a plate inside so the oil cannot be thrown into the pipes in the first place. Then used flared pipes like an old-fashioned locomotive stack. If there is a cone held,

point down, in this enlarged space it will deflect the air to the outside. This cone should be supported by one or more wires down which the oil may run so it does not drop and get blown away again. If you can put a box over your present pipes into which the air may expand and deposit the oil with a pipe to lead the oil back into the case it may serve. The principle to be kept in mind is to throw the oil against a wall and to quiet the air so it can let the oil collect. A screen in the pipe as you propose will reduce the area and force the air to travel faster at that point and break up the oil into a spray, all of which make matters worse. We use a screen in the pipe to make a better mixture as it comes from a carburetor. Some steam separators use a revolving part which the steam strikes and this by centrifugal force throws the oil against the outside wall, but since the air goes both ways in your case this will not work. A sketch herewith will help you to get the idea. We shall be glad to hear from any of our readers who have solved this problem. C. E. D.

ADAPTING AUTO ENGINE TO BOAT.

2132 Germantown avenue, Phila.

I have a two-cylinder auto engine, 4½ bore and 5½ stroke, both cylinders on the same throw of crankshaft. This engine is 16 H. P. at 1200 revolution. I would like to use it in a 28-foot launch. Would you kindly let me know what weight and size fly-wheel it would take to reduce the speed and still have 10 to 12 H. P., as the fly-wheel that is on the engine was not made for it. The engine has so much vibration that we think the fly-wheel is too light, or does it come from not being a double throw crankshaft? Please give us the information to the best of your knowledge, as we would like to put the engine in first-class running order.

CHAS. MARBACH,

Increasing the weight of the wheel will lessen the vibration somewhat, but not very much. Add a stiff base of wood and maybe you can hold it firm enuf so the vibration will not be objectionable. When the boat is in the water the vibrations are resisted by the water and if the engine is securely fastened to the hull there will likely be very little vibration. Determine how you wish to set the engine and make the wheel as large as you can conveniently and it will not hurt to double the weight. You cannot reduce the speed much if you wish to get the power asked for. If you experiment a little with two-bladed narrow propellers you can use the high speed. Try for a speed that gives the least vibration, for if you do not you may get one that the boat responds to and thus magnify the trouble. Two pistons on a single crank are a badly balanced load and there is little that can be done to help. See balancing answer this issue. C. E. D.

AUXILIARY PISTON.

Philadelphia, Pa.

I have been a reader of your Journal for six months and I will say that I have derived a fund of useful facts from your column of questions and answers, though I admit I have much to learn about gasoline motors. Will you devote a few minutes to the sketch I enclose and pass your opinion upon it? In the drawing A, are the cylinder walls; B, trunk piston; C, connecting rod; D, compression chamber; E, auxiliary piston; F, a sort of guide for E; G, a coiled spring requiring say 150 pounds to operate it. Now my idea is this: B, coming down to bottom of stroke draws gas into space D, is compressed to say 80 pounds, is fired and the piston E under the influence of the explosion moves upward while

B, of course, will move downward. The object of this device is to eliminate all vibration. Though I do not know the indicator pressure of a fired charge I will say it is 250 pounds, but I suppose that it falls considerably below at the exhaust end of the stroke so the apparent loss of power made by my device is compensated for by having a much greater pressure at the end of the stroke. Now will you answer me these questions: (1) Will it do away with all vibration? (2) Does the elimination of vibration compensate for the weight which will be added by the device?

HARRY J. MUHLER, JR.

Your idea of an auxiliary piston is not a new one. I do not recollect having seen it proposed as a means of relieving the high pressures at the beginning of the stroke as you propose to use it. It would probably have some effect in this direction, but not enuf to pay for the added weight, cost and leakage. It will not do away with "all vibration" for it does not remove the cause nor fully compensate. Motor vibrations are from unbalanced parts and from the reaction of the explosion. Your device does nothing to balance the parts. It does not do away with the reaction of the explosion, but simply eases it at the beginning and augments it near the end. The general effect would be much the same as without your device. The explosion would be felt rather as a push than as a knock, but the reaction must be there if the action is and if it reduces the action it is not what is wanted. The usual suggestion for such an auxiliary piston contemplates using this piston to completely exhaust the burnt gases at the end of the exhaust stroke. One of the first designs I tried when I began to experiment with vehicle motors was much like yours, except I had the spring behind the usual piston. This saved one piston. Many others have tried it, so do not waste any money on it.

C. E. D.

ABOUT REVOLVING CYLINDER MOTORS.

Sparta, Ont.

I have your January, 1907, Buyers' Guide Special. Let me know if you issue such a special this year. I would like to purchase it. The Burlat motor made in Lyons, France, is made in 4-cyl. and 8-cyl., also revolve about their crank shaft, similar to the Adams motor. I have Adams catalog and have written to the Burlat Co. for theirs. I cannot see why such an air-cooled motor would not be satisfactory. I would prefer it set perpendicular tho if connections to jack shaft could readily be made its disadvantage would be overcome. As Mr. Malcolm in January, 1907, article says a two-cycle motor built with say three revolving cylinders would give greatest power with least weight and least number of parts. Do you know of anyone else building that style of motor? I only want a motor, not the chassis.

J. A. WEBSTER.

The idea of revolving the engine to save the need of the flywheel has always seemed to me an attractive one. It gets rid of the dead weight of the wheel of which the only function is to carry over the dead spots and substitutes for this dead weight other weight that must be carried for working purposes. It would seem to be particularly adapted to aeronautic work where every ounce ought to be saved. When one comes to work it out, however, there are found certain difficulties that are not pleasant. One of these is the lubrication problem. The oil is needed on the cylinder walls, but the centrifugal force throws it into the heads of the cylinders where it is not wanted. Feeding oil freely will replace this and it would seem that this should not be a serious objection. How serious it is can only be told by trial in each particular engine. Another trouble that arises is also the effect of the centrifugal force. It is unpleasant to have an oil cup get loose and come out of that revolving mass like a bullet out of a gun. If one is working for the lighest weight and has gotten the iron about as thin as reasonable he is likely to wonder which way that head is going to go when it gets a bad heat strain and cracks under the combined influence of the centrifugal and the explosion forces. Foreign makers have increased the number of cylinders and thus have lessened the need for a flywheel and also have reduced the strain on the parts by getting a more continuous application of power. The simplest and best looking engine of the revolving type I have seen was shown by the Bailey Auto Co., of Springfield, Mass., at the Boston Show last year.

It was illustrated in this Journal May, 1907 issue, page 74. It had four cylinders of the two-cycle type and instead of the usual connecting rods employed Scotch yokes in which an annular bearing rolled. Each piston was carried by a piston rod passing thru a stuffing box in the lower end of the cylinder so each cylinder had its own compression chamber. This arrangement is tight, simple and effective. I regard it as better than the arrangement suggested by Mr. Malcolm. By mixing the lubricating oil with the gasolene it is possible to feed a two-cycle engine with oil positively and so evenly that there is no smoke yet ample oil. It beats a force feed or any other method. A gill of good oil to a gallon of gasolene or thereabouts will do to start with and the amount can be increased or decreased as the needs of the engine seem to indicate. The revolving two-cycle engine needs but a single coil and no distributer for the plugs get the spark as they come to a certain part of the revolution. A five-cylinder revolving engine has been shown at several of the auto shows held in New York. The Balzer. It usually had the shaft parallel to the car axle. We issue a Buyers' Guide Special each year in January.

C. E. D.

WILL IT CLIMB?

Port Republic, Va.

Answer me this question: Would the 6 H. P. Brush Runabout of Detroit, Mich., pull the hills in Virginia? Some of them are 25 per cent grade.

M. J. M.

To say whether any rig can traverse a certain hill or road requires that we know more about the road than merely its grade. If the surface is good, I would say that the Brush can pull it on the low gear and I have no doubt that if the makers know what your roads and grades are, they will fit the required low sprockets so that there need be no question about this.

2-Cycle Engines

HUGH DOLNAR

SUGGESTED 2-CYCLE ENGINE.

Rochester, N. Y.

Please look over this design for a 2-cylinder, 2-cycle motor with underneath compression cylinder, driven by two eccentrics; to slide on a stationary piston integral with the crank-box lower member. I have had the design and idea registered before a notary and also applied for patent, as I expect to build one for my own use and as the unique features I think will quite change the usual practice of port construction, owing to the high pressure of the incoming gas being 30 to 40 lbs. per square inch. Please advise me if the following proportions will be right for 800 revolutions per minute. The motor as will be seen is for a marine purpose, the size is 5 by 5, with inlet port 7/16 deep and extending around the cylinders 3 in. with a drop of ¼ in. below exhaust and being full open when piston is at its extreme. The exhaust is ⅝ and 3 in. around cylinder, the compressing

chamber is 8¼ in. diameter provided with 2⅜-inch rings 3-16-inch apart. The eccentrics have a travel of 2½-inch, are on a 1-inch shaft, with a bearing close at its side. This shaft is run by gears which are to be 1-inch face and 14 inch from the main shaft. The by pass is ½-inch by 2½-inch in the smallest extremity, and connects to space at side of crank case, the bottom partition being drilled or bored out to give connection to compressing chamber. This by pass is to be provided with a carburetor connection of 1¼-inch. The fly wheel is to be a webbed affair, 17⅝-inches diameter and to weigh 100 lbs. The crank shaft is to be drop forged 1⅝-inch in diameter and 1⅝-inch pin, cranks placed 180 degrees. I contemplate using crank case pressure for a scavenging agent, by throwing it in the cylinder ahead of the incoming gas.—C. E. CRAPO.

This picture and story are printed because they convey an obvious lesson which need not be put into words. First, charge compression before the charge is in the working cylinder, is work lost, and no more compression than enough to cause the charge to enter the cylinder should be given. It is both better and cheaper to use a 2-diameter piston, integral, well known form, as in Palmer's "Euclid" motor, if the engine is to be of more than one cylinder, than to use a separate piston, and moving cylinder with a separate cylinder driving action. I am convinced that it is an error to water cool the 2-cycle motor, if other means can be used, as the water cools the cylinders too much and makes the water cooled 2-cycle motor wasteful of fuel. With crank-box supply there is some excuse for high pressure, because it increases the volume of charge delivered to the cylinder. Broadly, the less charge pressure before entering the cylinder the better, so long as the charge does enter.—H. D.

2-CYCLE MOTOR WITH INTAKE THRU PISTON.

I would appreciate your criticism of the following dimensions of an engine I intend to build, 3-cylinder, 2-cycle, water cooled. The exhaust is an annular passage. The inlet will enter the cylinder through the top of the piston. A cylindrical extension on the top of the crank case, into which the cylinder sets will act as a by pass.

Bore, 4¼ in., Stroke, 5 in., Exhaust ports 4, 1⅝ in. by 1 in., equally spaced around cylinder. Inlet ports 4, 1⅛ in. by ½ in., equally spaced around cylinders, in such a way that they correspond only to ports in piston. By box. Impossible to say anything with certainty without seeing working drawings. pass, ¼ in., by circulation of cylinder. Hole in top of piston, 1½ in. diameter. Connecting rod, 9 3-16 in. cylinder to cylinder. Piston pin bearing, 1 in. by 2¼ in. Crank wrist, 1½ in. by 2½ in. Crank shaft, main bearing, 5 5/16 in. by 1¾ in. Crank shaft, inside bearings, 4⅝ in. by 1¾ in. Crank shaft, front bearing, 4⅝ in. by 1¾ in. Cylinder wall thickness, 5/16 in. Jacket wall thickness, same. Water space, ⅞ in. Compression figures, about 65 lbs. Crank case compression about 5 lbs. About what will be highest working speed and B. H. P.? What size carburetor should I use? Will this motor back fire into case? It is not 3 port, but uses a light check valve admission to crank case 2½ in. in diameter, small lift. About what weight flywheel can I use if it is 20 in. diameter? Any information you may offer will be gratefully received.—L. J. ROBINSON.

I have seen this form of parts in but one motor, the "Atlas," and had no opportunity for extended observation. ¼ in. is thick enough for your finished cylinders and your jackets. You should obtain 20 to 25 H. P. at 1000 R. P. M., at least. As you have a constant suction on the carburetor a 1½ or 1¼ in. pipe should do. Fly wheel, 20 inches diameter, 3 inches rim face, 1 inch thick, you do not need much flywheel. As your exhaust port opens ½ in. before the intake opens, you are likely not to fire the crank Your dimensions are ordinary practice, far as I know. In regard to this form of motor piston, ports in two planes, with central opening in piston head, I would say that the "Atlas" had trouble with self ignition and made a change of some sort; also I have been told that the Atlas piston is patented. I believe that as good results can be had with the exhaust port and the intake port opposite each other, usual form, as with the ports in two planes. I do not believe that there is any gain in having extremely wide ports, as the charge has plenty of time to enter the cylinder. I do believe that deflector form is of great importance. Placing the ports in two planes, as intended by Robinson, adds greatly to pattern making and moulding cost.—H. D.

O FRANKLIN FACTS

1. Light Weight—No power wasted carryin useless bulk.

2. Air Cooling—No freezing, n overheating.

3. Easy Riding—Wood frame an full elliptic springs absorb shock

4. Economy — Tire expense cu down; less fuel used.

5. Durability—Laboratory-tested ma terials save repair expens

Experience tells the story

Tire-saving

I have covered over 15,000 miles in my Franklin without a hitch Have bought only one new tire and had three recovered.—HENRY H. SIMONIN, 1217 W. LEHIGH AVENUE, PHILADELPHIA, PA.

Climbing

I have owned several cars previous to the Franklin. Its actual performance during an entire season has been a revelation to me. At hill-climbing the Franklin is the greatest I have ever driven.—HERMAN A. ARUS, NEW YORK CITY.

The Best of 9

I have had 9 different makes of cars. Have had better service from my Franklin than from any other; with less trouble and annoyance. I have found it the most reliable and least expensive to run.—GEORGE T. CUSHMAN, M.D., 46 DUDLEY ST., OSTON, MASS.

Cooling

wo Franklins remained throughout the three hours of the procession t one mile per hour). No heat at all. Six water-cooled cars boiled water away in less than 30 minutes.—D. R. GARDNER, MEXICO Y.

An Unprejudiced Verdict

I have driven or watched the operation of nea all the well-known cars on the market, and your H. P. (1907 D) will out-run, out-carry and out-tra any 40 H. P. water-cooled car I have seen, and I o an excellent water-cooled car too.—MACGREG DOUGLAS, OKLAHOMA CITY, OKLA.

8 Tough Miles

The engine will not get hot. About two we ago I ran the car eight miles through six inches mud on the low gear and the engine never fired o when I shut off the switch. I have had six cars, none of them ever did the work of the Franklin F. VAN BLAROOM, WESTMORELAND PLAC ST. LOUIS, MO.

10,500 Miles, No Repairs

The Model D we now have has run over 10, miles with absolutely no repairs except three r tires. Even the valves have never been ground, the machine is to-day running as smoothly and well as when it started.—S. C. LOWE CO., N BEDFORD, MASS.

Reliability

My FRANKLIN is a wonder. No one could h made me believe it was possible to cover 1600 m without opening a tool box but once, and then onl separate the points on a spark plug and to mak slight adjustment to the engine.—H. HARWO GARFIELD, 1 EXCHANGE STREET, ROCH TER, N. Y.

PROPOSED 2-CYCLE MOTOR.

Enclosed please find rough pencil sketch of a 2½ by 2½ inch 2-Cycle Engine, which I intend to build. Will you kindly tell me thru the columns of the Journal if you think the design practical. The sketch is full size. I intend to make the ports clear around cylinder. What H. P. will it develop?—J. O. THOMAS.

As shown the ports are 3-16 in. inlet and 5/16 in. exhaust. The inlet is rather short and the exhaust much too short, in my opinion. I would make the ports ¼ in. intake and ½ in. exhaust. Nothing is gained by holding the burning charge in the cylinder when the crank is near the end of working stroke. The drawing shows 13-16 in. compression space, with 2½ in. stroke and ½ in. exhaust port. The compression will be something like 50 lbs., cold air.

This would give say 75 lbs. mean working stroke pressure, or, at 2000 R. P. M., 166 feet of piston travel, 75 lbs. pressure, 4.8 inches piston area per minute, allowing the working stroke to be 2 inches long.

This gives 360 lbs. on the piston, multiplied by 166 feet piston travel gives 59,760 foot-pounds of work per minute, which divided by 33,000 gives 1 26-33 H. P. for your motor at 2000 R. P. M., rough estimate.

I would prefer to change the deflector as shown in dotted lines, and core up into the deflector with the piston core to keep the deflector cool, as shown in the dotted lines.

I would also hold the rod cap with two screws instead of hinging it, and would make the piston pin at least ¾ in. diameter instead of 7/16 in. as you have it.

You have shown ⅛ in. cylinder wall. This should be at least 3-16 in. thick, and 7-32 in. would not be too much in my opinion.

I would omit the lower piston ring, and use the middle piston ring only as a piston pin retainer.

You might make the piston 3-16 in. thick everywhere. The piston should be light as you can make it.

Make your deflector as high as you can and clear the cylinder head.—H. D.

WANTS H. P. FORMULA.

Rochester, N. Y.

Kindly furnish us with the latest formula that the A. A. A. has adopted in regards to figuring out H. P. of gas engines and oblige.

J. G. WAGNER, JR.

As far as I know the A. A. A. has not adopted any formula, but the A. L. A. M. has, which is as follows: Square the cylinder bore (dimensions being in inches), multiply by the number of cylinders and divide by 2.5. This is of course an approximation and will give fairly good results. However, if you wish to obtain more accurate, preliminary calculations, you can use the regular formula for any kind of engine, that is, Plan-:-33,000, in which P is the mean effective pressure in pounds per square inch. For 2-cycle boat motors 60 pounds is a fair pressure, for automobile 4-cycle engines, 75 pounds will probably give more accurate results. L is the length of stroke in feet. A is the area of the piston head in square inches, and N is the number of working strokes per minute. This divided by 33,000 will give the H. P. as close as most any method, except figuring it from indicator cards, which cannot be done unless the motor is already built, in which case the brake test is much more satisfactory and accurate.—Ed.

CARBURETORS AND SILENT CHAINS.

You so kindly helped me out once before when I was puzzled, that I make bold to again ask your advice.

Enclosed are two booklets. The first thing that I wish advice about is whether the Silent chain in your opinion is superior to any other for automobile use. Also is same perfectly satisfactory for an automobile, if not, why? run naked in the dirt. I have never seen it used to drive automobile driving wheels directly.

The only way to find out about carburetors is to try them, one after another, on your motor. Carburetors which give good results on one kind of motor are not so good on other motors, or it may be the other way about. Each one mentioned suits some motors best.—H. D.

the claims exaggerated or not, also which one would you use, if you had your pick, Holley, Shebeler or Stevens?—JOHN P. BATES.

The Renold silent chain has a very high reputation for use where it can be kept clean and well lubricated. I do not think it fit to

2. In the circular about carburetors, are

2-CYCLE ENGINE QUESTIONS.

1. Can a two-cylinder two-cycle engine be built for less than same four-cycle.

2. Does not a two-cycle engine, furnished with compression cylinder give better service than one fed by crank-case compression?

3. If two two-cycle engines are of the same bore, and one twice the stroke of the other, will not the shorter stroke engine speed up more than the other and therefore give more than ½ as much H. P?

(4). In the case of a ball-bearing crankshaft or wheel, is it advantageous to have the cones and ball runs as small as consistant with strength, that the balls will have less turning to do; or does the added strain on each ball make up for the decrease in wear? —W. R. M. V.

(1). Any small size of single acting 2-cycle motor costs much less than same size and number of 4-cycle cylinders, if crank-box pressure is used.

There are large, double-acting, 2-cycle motors with charging cylinders which cost as much as 4-cycle motors of same cylinder dimensions, but are much more powerful. (2). Yes. (3). Practice seems to favor the shorter strokes because of quicker acceleration, as you mention, but the short stroke should not show any gain of power for total quantity of fuel burned, as the friction is proportionally greater with the shorter stroke, as is, also, the port length loss. (4). I have had no experience with ball bearing crankshafts. It would seem that the more balls there were to take the work, the less load each ball would have to carry, while true rolling creates very little more friction because of velocity increase. As a rule, the more balls, the more durable the bearing.—H. D.

A CORRECTION.

The Trade Journal for January contains an article entitled "Considerations of Motor Car Elements," by Mr. Hugh Dolnar.

The writer states in several places that in an alternating current generator the current is strongest when the armature coil is passing along the gap between the pole pieces of the field magnets.

As the article was written primarily, for those having little or no knowledge of electricity, a few suggestions may prevent some reader from being misled, particularly as high-tension magnetos must be timed to obtain proper results.

In any kind of electrical generator the current is strongest when the armature conductors are moving at right angles through the magnetic lines of force.

In the accompanying sketch the armature coil is shown passing along the field gap between the pole pieces.

In this position the conductors move parallel to the line of force and no current is generated at this part of the revolution.

As the armature rotates the conductors commence to cut through the line of force and current is generated which reaches its maximum value when the armature is in a position, one-fourth of a revolution from that shown. After that point is passed the current diminishes to zero when the conductors are again moving parallel to the lines of force.—F. J. BAUER.

Mr. Bauer is correct. The word should have been "core," not "coil."

This article was written with Mr. George Wacker, who is an able electrician, and was to have been a story of the Unterburg and Helmle high tension magneto, and as very few users know anything about magneto action, I proposed to write the simplest story possible of magneto "action," not "Principles." Mr. Wacker agreed, and the story was written in kindergarten terms, was read by Wacker in longhand, and after being typewritten. The Journal editor saw fit to divide the story and print part of it as "Principles." Mr. Wacker writes as follows:

Hugh Dolnar:

In the first place, your article says that in each revolution of the armature, two electrical impulses are generated or produced. So far we are correct. Now, these two impulses are not of a uniform strength or intensity during their existence, but vary from a point of maximum intensity to zero. The point of maximum intensity occurs when the armature of the magnet stands, as shown in Fig. 1, or when the ends of the armature core (also called poles as well as the fields), are passing the gap.

The point when the intensity of the current is zero is when the armature stands, as [illegible]

You see that when we say that the maximum effects are produced when the armature coil passes from one field to the other, we are wrong. If we say that the maximum effects are produced when the armature core passes from one field to the other, we are correct. Or you might correctly say, that the maximum effects are produced when the armature passes from one field to the other, as you do, in your article, in the paragraph "Time of Interruption," but the second line should read core, not coil.

The title was not appropriate. Your story described the U. H. magneto action all right, but it was not at all a good article on the "Principles Underlying Magneto Current Generation."—GEORGE W. WACKER.

STANDARD DRILLING JIG BUSHES.

F. Wertheim, 151 East 36th Street, Chicago, sends this table of proposed dimensions for "standard" drill jig bushings. Present practice is for each factory to make its own jig-bushes, which calls for a drawing for each separate size, and also makes it unlikely that the factory will have replacements on hand.

STANDARD BUSHINGS

A	B	C	D	E	A	B	C	D	E
3/16	7/16	9/16	5/8	3/32	1	1 7/16	1 11/16	1 1/8	3/16
1/4	1/2	5/8	5/8	3/32	1 1/8	1 5/8	1 7/8	1 1/8	3/16
5/16	9/16	11/16	5/8	3/32	1 1/4	1 3/4	2	1 1/4	3/16
3/8	11/16	13/16	5/8	1/8	1 3/8	1 15/16	2 3/16	1 1/4	3/16
7/16	3/4	7/8	5/8	1/8	1 1/2	2 1/8	2 3/8	1 1/2	1/4
1/2	1 13/16	15/16	3/4	1/8	1 5/8	2 1/4	2 1/2	1 1/2	1/4
9/16	7/8	1 1/16	3/4	1/8	1 3/4	2 7/16	2 11/16	1 1/2	1/4
5/8	1	1 3/16	3/4	1/8	1 7/8	2 5/8	2 7/8	1 1/2	1/4
11/16	1 1/16	1 1/4	3/4	1/8	2	2 3/4	3	1 1/2	5/16
3/4	1 1/8	1 5/16	1	3/16	2 1/4	3 1/8	3 3/8	1 1/2	5/16
13/16	1 3/16	1 7/16	1	3/16	2 1/2	3 3/8	3 5/8	1 1/2	5/16
7/8	1 5/16	1 1/2	1	3/16	2 3/4	3 5/8	3 7/8	1 1/2	5/16
15/16	1 3/8	1 9/16	1	3/16	3	4	4 3/8	1 1/2	5/16

Mr. Wertheim suggests that some of our well known tool makers, Pratt and Whitney, Brown and Sharpe, Starrett or Wells Bros., should adopt standard body sizes and supply the trade. Perhaps some of the twist drill makers would be the best to supply jig bushings, as they supply the drills to be used with them.

Mr. Wertheim says, in part:

"Go into any shop and you will find at least a few jigs, and in some you will find jigs by the thousand.

Where you find jigs, you will invariably find loose and broken drill bushings.

With standard bushings in stock, drill jigs will be kept in much better repair, work will of course be of better grade, and jig repairs will be much cheaper than when each factory tool room has to make single bushings or a score of them.

Our large tool makers will know how to get bushings up in good shape, whether to get out bushings with a 2 degree taper, or to get out a straight bushing, and whether to make bushings plain or with a flange, out of case hardened machine steel, tool steel, or alloy steel."

All this is undoubtedly correct, and it is to be hoped that some of our small tool makers will take up Mr. Wertheim's valuable suggestion.

BELI
NOR'

CLEVELAND, O. Jan. 16,'08.

O. C: Foster, Esq.,
Mgr. Cleveland Branch,
Warner Instrument Co.,

Dear Sir:-- Last year you furnished me with an instrument which I used on the "Mudlark" in my tour from New York to Florida, and it gave us such good satisfaction that I would like to have one of your clock and light instruments for a model "M" Olds in which I will make a similar run this coming week from New York to New Orleans by way of Syracuse, Buffalo, Cleveland, Louisville and Birmingham.

Trusting that you will give this order your personal attention, and that I may receive the instrument in time, as other speed indicator companies have offered to furnish me free of charge an instrument for this occasion. However, I would rather buy a Warner than accept their offers as the Auto-Meter has always given me complete satisfaction.

I remain, yours very truly

R. R. Owen.

Fires, Failures, Judgments, Etc.

The Homer Boushey Automobile Co., of San Francisco, Cal., has had two attachment suits filed, against it one for $1400 by Hattie Coblentz, and the other by James Fleming.

The Commercial Acetylene Co., of New York, in a decision handed down by the United States Court of Appeals, at Chicago, has been restrained from bringing suits against agents, customers, or users of automobile lighting equipment sold by the Avery Portable Lighting Co., of Milwaukee.

The report of the receiver at the creditors' meeting of the Consolidated Mfg. Co., Toledo, Ohio, shows a net profit for the twelve months of the receivership, after charging off $17,571.43 reserve for depreciation, and $3,175.17 reserve for bad debts, of $51,448.35. As soon as the present financial situation warrants it, a plan of re-organization will be submitted.

An explosion of gasoline in the repair shop of the Detroit Cycle and Motor Co., Detroit, Mich., located on the ground floor of a four-story building, set fire to the building causing a damage of $5000.

Da-an-nite Auto Supply Co., New York City, filed petition of involuntary bankruptcy; debts, $7263; nominal assets, $26,224.

Johnson, Wm. L., Automobile Supply Co., 4390 Olive St., St. Louis, Mo., fire completely destroyed stock and damaged building; loss, $1500.

Alfred N. Mayo, assignee of the Knox Automobile Co., Springfield, Mass., under date of Dec. 1st, 1907, issued $500,000 preferred stock, which has been accepted by all its creditors in full satisfaction of their claims.

Kansas City Motor Car Co., Sheffield, Mo., filed involuntary petition in bankruptcy. Mr. I. P. Ryland was chosen trustee.

Garage of Harry Lauterbach, 235 West Sixty-ninth St. New York, destroyed by fire. Four automobiles were burned; damage amounting to $13,000.

Lowell Automobile Co.'s garage, Lowell, Mass., damaged by fire to the extent of $45,000.

O. K. Machine Works, 887-889 Main St., Buffalo, N. Y., filed an involuntary petition in bankruptcy.

Acting on statements contained in the report of Receiver Geo. J. Smith, of the Okey Motor Car Co., Columbus, O., in the Common Pleas Court, an order was handed down directing the receiver to resume the business of the concern along the lines indicated in his report. The receiver outlined arrangements made with creditors having contracts partially fulfilled and asked permission to complete these contracts, which was granted.

Garage of Christian Peper, 4454 Forest Park boulevard, St. Louis, Mo., damaged by fire; loss, $75.

Robert Homans, of Boston, Mass., was appointed ancillary receiver of the Royal Motor Car Co., of Cleveland, Ohio, which has about $8000 worth of property in Massachusetts. Arthur Berry has been appointed ancillary receiver for New York City, the assets consisting of automobile parts and accounts valued at $8000.

The Appellate Division of the Supreme Court has just affirmed the judgment rendered by Justice O'Gorman in the suit of Rowland vs. Clifton, and known as the Searchmont suit.

Jos. N. Smith & Co., Detroit Mich. Fire on Feb. 12 temporarily disabled the working part of the factory.

E. C. Stearns & Co., of Syracuse, N. Y., purchased from the directors of the Pope Mfg. Co., the interest which that company held in the Stearns plant in Oneida street for the sum of $25,000.

The St. Louis Motor Car Co., St. Louis, Mo., according to the report of the trustee, J. M. Sholl, will pay its creditors from 20 to 25 per cent. on the dollar. An itemized report shows receipts from all sources amounting to $19,540.11, and disbursement of $6,157.20, leaving a balance on hand of $13,382.91.

Termaine Electrical Co., Washburn Building, School Street and City Hall Square, Brockton, Mass., garage, damaged by fire; loss, $200.

Winchester Speedometer Co., New York City, filed a petition in bankruptcy. Irving Washburn has been appointed receiver, under a $1000 bond.

Suit has been entered to the amount of $2508 by B. F. Nicholas, against the Wheeler Motor Co., of Colfax, Wash., to recover amount alleged due him for services as manager of their store in Colfax.

Fifth Avenue Garage, West Forty-fourth St., between the Algonquin and Iroquois Hotels, New York City, damaged by fire; loss, $16,000 in automobiles.

Following the guarantee made by Mayor Tiedeman of Savannah, Ga. that the races of the Savannah Automobile Club scheduled for March 18 and 19 would be held as planned, comes the news that those days will be made public holidays by that city's chief executive.

Trade Changes

George Bartel, 807 Commercial St., Burlingame, Kansas, sold his garage and machine shop to E. F. Standiford.

Broadway Rubber Tire Works, 51 W. 63rd St., New York City, will in the future be under the sole proprietorship of Otto Braunwarth.

J. D. Crum, Jacksonville, Fla., has sold his automobile business to his brother, C. F. Crum.

H. C. Farnham, of Warren, Ohio, recently purchased the entire business of the Valley Automobile Garage on East Market St., where the business will be continued as formerly under new management. A company is to be incorporated for $20,000.

Flint Motor Car Co., 212 Union St., Providence, R. I., moved to new and spacious quarters at the corner of Aborn and Washington Sts.

Hawley Automobile Co., of Constantine, Mich., has moved its auto factory to Menden, Mich.

The Hol-Tan Co., New York, has moved from its present quarters to 244-246-248-250 W. 49th St.

Interest in the garage of J. A. Hitchcock, Warren, Ohio, purchased by W. H. Crehan, Youngstown, Ohio. The firm will manufacture and repair automobiles.

J. C. Jensen has purchased an interest in the auto garage and horse livery of C. E. Beardsley, and the firm is now styled Beardsley & Jensen, Woodstock, Ill.

Chas. E. Miller, New York City, has moved his Cleveland branch from 406 Erie street, to 829 Euclid avenue.

Meteor Automobile Works, of Bettendorf, Iowa, has recently been succeeded by the Meteor Motor Car Co.

Lord Motor Co., Los Angeles, Cal., has moved from its present location to larger premises on Gasoline Row, near 12th street.

Parker, Lewis & Son, opened a garage at Frelinghusen Ave. and Wright St., Newark, N. J., where they will handle the Mora Car.

Ralph Rice, of the firm of Rice & Odell, Cedar Falls, Iowa, disposed of his interest in the firm to his partner, Earl Odell, who will continue the business at the old stand.

Lewis E. Rice, manufacturer of the Little Wonder Vulcanizer, recently purchased the interest of Frank Wilcox in the Lewis E. Rice Co., of Fort Dodge, Iowa, and is now sole owner of the business.

Jasen C. Stamp, who for some time past has successfully conducted the automobile garage at Eoff and 16th Sts., Wheeling, W. Va., has disposed of his interest to R. H. Mahlke, who will in the future conduct the business under the name of the Mahlke Automobile Garage.

Wabash Auto & Electric Co., Terre Haute, Ind., will move from its present quarters, 925 Wabash Ave., into a new building, which will be located on the vacant property west of the retail store of the J. R. Duncan Paper Company, 668 Ohio St.

Legislative and Legal

Recently in Jefferson City, Mo., Secretary of State Swanger ruled that a State license is good so long as the licensee uses the machine on which the license is taken out. Should he procure a new machine it will be necessary to take out a new license.

The Legal Committee of the Rhode Island A. C. recently presented to the General Assembly a drastic auto law with fines of from $10 to $500 and imprisonment of from 10 days to one year for its violations. It is chiefly aimed at non-resident scorchers.

A special committee representing the New York State Automobile Association recently introduced a bill, a feature of which is an annual registration fee based on the weight of the car. The cars will be divided into four classes—runabouts, small touring cars, medium touring cars and high power cars. The fees will be $2, $3, $4 and $5 a year, respectively. The proceeds will be used for the maintenance of State highways.

On request of the Toledo Automobile club, Senator Lamb, of Ohio, introduced a bill making it a misdemeanor to wrongfully take and use an automobile. The penalty is to be a fine of $100 to $500 or imprisonment in jail or workhouse six months to one year.

A new Delaware law is modeled after the New Jersey motor-vehicle measure, but allows non-residents to tour 10 days without securing a license. A fine of $100 or imprisonment for 30 days or both can be given for driving an automobile while intoxicated.

The National Battery Company owing to the increase in business has taken over the entire building at 236 W. Fifty-fourth street, New York.

Rider Lewis Sixes

The Rider Lewis Company's designs are based on a wide acquaintanceship with the best European practice, supplemented by years of American road experience. The result is a modern 6-cylinder motor car, containing no radical features, and yet at the same time embodying all that is latest according to accepted engineering practice.

These cars are made in two models, Type VIII, a touring car of ample tonneau room and a two-passenger roadster, Type IX, both use the same six-cylinder motor and the general chassis specifications are the same. The runabout can also be fitted with a single or double rumble seat at the rear.

GENERAL SPECIFICATIONS.

The motors are rated as 40 H. P., have 6 cylinders, cast individually, and are water cooled. Shaft drive with the change gear of sliding type selectively operated is mounted on the rear axle, which is of the live semi-floating type. The wheels are 34 inches, with 4-inch tires, and the springs are semi-elliptic front and C or ¾ elliptic at the rear. The wheel base is 122 inches, tread standard. The touring car weighs approximately 2375 lbs. and the roadster 2200 lbs. The price of each with an equipment of 2 gas head lights, 2 oil lamps, 1 tail light, horn and tools, is $2500.00.

The most striking feature of Rider-Lewis sixes is high power as related to weight. In obtaining this proportion it is claimed no strength has been sacrificed. Light weight has been arrived at, principally by elimination. Unnecessary parts have been left out; wherever one part could be made to do the work of two, and do it equally as well, it has been so incorporated in the designs. Simplicity is the very keynote of their construction. From the motor in front to the compact transmission axle in the rear, there is no surplus metal,—no roundabout methods of control. Accessibility is one of the most prominent features. In the motor, the valve cages are readily dismounted by the loosening of a locking ring. The valve is withdrawn with the cage as a unit, and may be either reground or a new valve cage inserted. This feature appeals strongly to those who have had their car "laid up" for a day to have valves ground. Valve-in-the-head motors were a marked feature of the recent shows, and in following this tendency the company has endeavored at the same time to provide ample cooling for valve pockets: this, when overlooked, has caused much trouble even in otherwise splendid cars.

The water pump is mounted on a vertical shaft driven by bevel gears enclosed in the forward crank case cap. This vertical shaft terminates in another set of bevel pinions that drive the cam shaft, which is across the top of the cylinders. Cams and rocker arms are protected by aluminum housings; thus ample lubrication is assured, together with long life of bearings, and silent motor operation.

Fig. 1. Rider Lewis Type VIII touring car. Motor 40 H. P., 6 cylinders cast individually, water-cooled, overhead cam shaft, positive lubrication by pump to crank case, splash. Three speed sliding selective change gear on rear axle; shaft drive; 1 section front axle, 34 inch wheels, 42 inch tires. Internal and external brakes on rear hubs; 122 inches wheel base; weight, 2375 lbs.; galosine capacity, 16 gallons. Price, with 2 gas head lights, 2 oil lamps, 1 tail light, horn and tools, $2500.00. Landaulette and limousine bodies are also supplied on this chassis.

The crank case is a one-piece casing into which the crank shaft is assembled endwise. Front and rear caps close the crank shaft in, while hand hole plates give easy access to the connecting rods and crank shaft bearings.

The clutch and clutch operating mechanism is directly under the front floor boards, so that oiling and inspection of this important part can be readily looked after. The forward universal joint is coupled directly to the clutch sleeve casing.

The mounting of the change gears on the rear axle is being widely followed for 1908. This construction is followed in the Rider Lewis, as it eliminates the likelihood of serious disalignment of motor and transmission, whether they are mounted in units on the chassis, or supported together in a rigid housing on a "three point" suspension.

This three-speed selectively operated

Hosted by Google

change gear is very compact, and adds little weight to the usual type of rear axle, as it is claimed only the highest grade materials are used.

The transmission and rear axle form a compact unit. Aluminum housings of sufficient strength to make an exceptionally rigid axle are used; at the same time providing a very light method of mounting the transmission. The, gears and shafts can be readily withdrawn from the forward end of the combined differential and transmission housing. All gears are of chrome nickel steel mounted on chrome nickel steel shafts, after the most approved methods of construction.

Prest steel side rails of ample section are riveted to brace and tie members. The length of the wheel base will average well with cars of similar power. The frame is narrowed in front to permit of a shorter radius for turning, and drop frame construction is used at the rear, giving ample clearance above the rear axle, and at the same time providing a straight line drive, reducing universal joint wear to a minimum.

to exact micrometer measurements by special automatic machinery, thus insuring perfect bearings. Cylinders, pistons and piston rings are ground accurately to size and all parts made absolutely interchangeable.

STEERING GEAR.

A modern irreversible worm and nut steering gear is provided with a reduction ratio that makes high speed safe. Parts in the steering gear are all well hardened and carefully ground. Upon the steering wheel are mounted the spark and throttle control levers. Rods from these levers lead through the steering column and terminate in a bevel pinion and vertical shaft. On this small vertical shaft are mounted arms which connect direct to throttle and ignition levers.

The carburetor is of the Venturi tube type, giving, it is said, a constant mixture at variable motor speeds, without the use of moving parts. It responds immediately to the slightest movement of the throttle and is claimed to be very economical.

IGNITION.

High tension ignition is used, a storage battery of large capacity being the source

Fig. 2. Rider Lewis Type IX Roadster. The general chassis specifications are the same as for the touring car. Speed, 60 miles per hour. Weight, 2200 lbs. Price, $2500.00.

SPRINGS AND AXLES.

The semi-elliptic springs have proven themselves best for front axles, but are lamentably lacking in resiliency when used under the tonneau. To obviate this many manufacturers have installed springs of extraordinary length, while others have compromised on full elliptic and platform suspension. The "C" type of spring used, now so widely adopted abroad, it is claimed, gives an ease in riding that must be experienced to be realized. The lower half of spring is securely attached to the frame after the best semi-elliptic practice.

The front axles are of high grade "I" section steel forgings, of ample size. Careful attention has been given to the design of the steering spindle and yoke.

MATERIALS.

The company claims that nothing better in the way of materials is being used in the most expensive cars. The crank shaft is made of the very best steel for crank shaft purposes, by a firm who has thoroly tested out all of the steels proposed for this work. All crank shaft journals are ground

of electrical current. Provision is made for the installation of a high-tension magneto through a bevel gear drive from vertical shaft at the front of the motor.

A force feed oiler driven by a spring belt furnishes oil to the crank case of the motor, while the moving parts inside are thoroly lubricated by the splash system. The transmission and differential are also lubricated by splash. The forward wheel bearings are packed in grease. It has been the aim to simplify the lubricating proposition by using the splash system wherever possible.

The wheels are made from the very best ash obtainable, ten spokes being used in the front and twelve in the rear.

The brakes operate directly on the brake drums of the rear wheels, and therefore impose no strain on any of the driving parts. The percentage of brake surface to weight of car is said to stand exceptionally high. Adjustments can be quickly made and new brake liners may be installed at slight expense.

No pains have been spared to keep the

ANNOUNCEMENT

SEASON OF 1908

The Springfield Motometer

The Motometer enters its fourth season the same correctly designed, beautifully made and thoroughly reliable instrument as when first offered to the American motor builder, seller and owner. In the three seasons past it has, while avoiding sensational methods and extravagant claims, steadily gained friends both at home and abroad by honest, accurate service. **No speedometer made has a better earned reputation.**

While in producing the 1908 models it has been possible to add several features of real and proven merit, it has **not** been found **necessary** or **possible** to materially change the model of previous seasons. It **was** and **is** right. For this reason, although it has **always** sold at a **fair** and **moderate** price, it has been possible to make for the coming season

A New Schedule of Prices

hich, quality considered, puts the motometer beyond egitimate competition as a **high-grade** speedometer. ere they are:

he Standard 50-Mile Pattern, with all 1908 improvements, complete **$35.00**

0-Mile Pattern, same in every respect except speed capacity **40.00**

00-Mile Pattern, for high-power flyers . **50.00**

Either model fitted with our maximum speed hand, the est device of its kind, $5.00 extra. These new prices are vered by new and

Four years making the Motometer

Hosted by Google

finish up to the standard set by the rest of the car.

Refinement of design and the use of better materials has made possible reductions in weight that would have been considered unsound but a few years ago. The touring car weighs 2375 lbs. and the runabout 2500 lbs. Steel construction is used thruout the bodies, making them light and serviceable.

They are of the straight line type. Touring car, limousine, landaudet and roadster bodies are supplied. The guards are of the shield type, and the mechanism of the car is thoroly closed in. There is nothing unfinished, nothing crude in the tout ensemble. Large tires provide a luxury appreciated by "motorists who know." It has been the company's endeavor to provide the most serviceable car possible, together with the very best materials at a moderate price.

The A. A. A. Federal Automobile Bill

A hearing on the Federal Registration Bill (H. R. 428), introduced at the present session of Congress by the American Automobile Association, will be given by the Judiciary Committee of the House of Representatives on Thursday, March 12, 1908.

This movement is to obtain national registration which will make it possible for one desiring to tour, to obtain a single Federal license which shall be honored in all the States and do away with the unnecessary, troublesome and often unjust requirements now imposed by the various State laws. This bill does not, however, affect the rights of the individual States, but simply establishes a Federal control over automobiles used between the States, obviating the present necessity of securing a license in each State entered by the tourist.

This is a worthy cause and a decided step in the right direction, and it is desired that every automobilist lend his support to the movement.

Training Automobile Mechanics

The Auto Technical Association of Austria is organizing a training school for automobile repair work in the rooms of the Handicrafts Exhibition. It is especially intended for country blacksmiths, locksmiths and other mechanics with a knowledge of machinery, and, besides helping to provide automobile repair shops in country places, the school will open up a new means of livelihood to these workmen, many of whom have lost a good deal of their original business through the introduction of the automobile. The school will be completely equipt with tools and all requisites for the work of repairing all cars. The course of instruction will last four weeks. Special provision will be made for the admission of workmen in poor circumstances by the grant of a small pecuniary compensation for the time spent in the school.

The Detroit Show

This year's show at Detroit Mich., the seventh annual under the auspices of the Tri State Automobile and Sporting Goods Association, was indicative of the growth of the industry being bigger, better, and more successful than previous shows. New models were shown by The Aerocar Motor Co., The Blowstrom Mfg. Co., Regal Motor Car Co., and Oakland Motor Car Co., the latter showing a taxicab. A new speedometer was shown by Artizan Brass Co., a new anti skid by Perfection Non Skid Climber Co. and a new friction transmission by Seitz & Co.

Cleveland Auto Show

Cleveland's annual automobile show, Feb. 17-22, as usual this year takes position in the front ranks of local exhibitions. The exhibitors included 38 accessory makers and 29 agents representing 39 makes of cars. Decorations were in white and gold and 7500 electric lights were used in the illumination of the Central Armory building in which it was held.

A slight fire visited the factory of Jos. N. Smith & Co., of Detroit, Mich., but as most of the damage was done by the water and not by the fire, the plant was only temporarily disabled and will soon be in full working order again.

By some inexplicable error the address of Northwestern Storage Battery Company was given in the Buyers' Guide in the January "Journal" in two different places as Chicago, Ill. The correct address of this company is 448 Milwaukee street, Milwaukee, Wis.

H. H. Franklin Mfg. Co., of Syracuse, N. Y., held an automobile show in that city recently at which many accessory dealers and makers also exhibited. The Franklin Company had a unique method of demonstrating the value of light weight by drawing miniature cars of different weights up an incline by means of two equal weights to represent equal driving power. The lighter car, of course, traveled up the incline faster than the heavier one.

Mr. F. A. Babcock, President of the Babcock Electric Carriage Company on returning from abroad where he visited both the Olympia show in London and the Paris Salon, declares that at each show there was much that was interesting but the fact that impressed him most forcibly was the abscence of electrics of the runabout type. He finds that in the electric field only laudaus, laudaulets and broughams are used and they are almost entriely for public hire.

The Euclid Motor Car Company, Cleveland, Ohio, U. S. A., was formed in May, 1907, to xploit the inventions of Herbert R. Palmer, M. E., who began to investigate the small internal combustion motor in 1900, and has produced several patented gas engine designs. The particular Palmer car-motor design selected for use in the car here described was three cylinders 2-cycle, air-cooled, with individual compression cylinders and pistons or supplying each working cylinder with a combustible charge of air and gasoline mixed by passing through a carburetor of ordinary form, the "Gaeth" carburetor being used with the motor here illustrated and described. Applications for patents on this motor are pending.

Fig. 1. Euclid Runabout. Wheel-base 100 ins., gauge 56 ins., tires all 30x3½ ins. Motor, 3-cylinders, 3⅜x3½ i
ycle, air-cooled, nominal 20 H. P.
Friction drive to divided countershaft with bevel balance gear and chains to the rear wheels. Weight from 1300 t
Price not yet fixed.
This illustration shows full elliptics in front and half-elliptics in rear. The rear springs are to be changed to platform

The supply cylinder and the working cylnder are integral, placed tandem, with the ame axis prolonged, while the working and harging pistons are also integral and conentric, each charging piston supplying, not s own working cylinder, but the working ylinder next behind it in order of firing. This akes it needful to pipe the charging cylinder elivery port of one cylinder to the intake ort of the next following cylinder in chargeing order, so that, numbering the cylinders 2, 3 front to rear, the No. 1 charging cylnder supplies the No. 2 working cylinder, e No. 2 supplies the No. 3 and the No. 3 harging cylinder supplies the No. 1 working ylinder.

This form of charging mechanism is well nown except in the one particular of indidual cylinder supply, previous examples

considerable volume variation, while individual supply, as here shown an scribed, each working cylinder receiv it should, a constant charge volume, r less of varying conditions. This diff is generic and is new to the writer.

It is interesting to note that attentio first directed to this method of 2-cycle c supply by a suggestion to a correspo made by the late C. P. Malcolm, in the Jo of Dec. 1906. Mr. Malcolm's opinion i instance is abundantly supported by event, as this new motor is a distinct forward in the advance of the 2-cycle m

The Palmer motor is air-cooled by end the assemblage of cylinders and openin casing to an exhausting fan; the cold air in

openings in the cylinder casing being adja to ports requiring most cooling effect, enal the exhaust fan to effect local cooling manner quite impossible with air forced the cylinder casing by a fan. This exhaus fan passes a current of cold air over the haust ports adjacent to the casing open to the atmosphere, and so can and does m the exhaust passage walls the coolest p of this new 2-cycle air-cooled motor.

For the chassis frame a steel tube arra ment is used, made of ordinary tubes special fittings, the joints being fixed pinning and brazing. The tube diam is 1½ ins., and the needful vertical load sistance is obtained by trussing the ch frame side-members as shown, with k posts and screw length-adjusted rods.

This first car, as here shown, was place

nodel will have platform springs in the rear.

THE FRICTION DRIVE.

The drive is an aluminum friction disk and a riction wheel faced with tar-paper supplied by Rockwood of Indianapolis. The countershaft asing encloses divided sprocket shafts with a eveled balance gear. The chains are very nort, and the friction members are very nall, 14 ins. disk diameter and 14 ins. paper heel diameter. In the next model the disk nd paper wheel diameters will both be inreased. The paper wheel traverse is by a ell-crank with links to a collar in a groove n the paper-wheel hub. The present inention is to wholly enclose the friction drive nd the side chains in a dust-proof casing.

In the next model one single steel-ca header, suitably bored, will form the f cross-member of the chassis frame, and motor cylinders and upper part of the m base and the charge transfer passage w will form one integral casting, while the t crank-shaft boxes are integral with an in mediate motor-base member to which separate oil-basin is fixed underneath.

Following out the integral fittings sch a single steel casting will be placed in the chassis frame to reach across and take side tubes and support the disk-shaft and countershaft so that frame deflection ca change the relative positions of the disk the paper wheel, which is extremely impor as the slightest variation from correct pla causes the paper wheel to creep on the with a very powerful action difficult to strain.

The exhausting fan is now belt dri and the ignition is by jump spark plugs,

Fig. 2. Euclid Runabout, right side of motor in chassis and control levers.

The fuel-tank, 10 gallons capacity, 200 miles range, is placed close in front of the front-board. The fan, horizontal ane dia. 11 ins., is belt driven about 7 to 1 from the crank-shaft. This fan is to be changed however, to be gear drive laced on ball bearings. Fan exhausts the cylinder air jacket which is opened to the air at points where the motor needs oling effect.

The spark and throttle levers are on top of the steering wheel. The Ross steer ng gear is fitted. The outside hand ifts the friction wheel across the disk. There are two large pedals on the foot-board, both latched. The pedal at the pplies the internal brake shoes in the 10 ins. dia. rear hub brake drums and the left large pedal engages the friction driv unger cut-out pedal is also fitted.

The motor and countershaft are carried n a steel tube sub-frame. Struts are placed oth front and rear. The front struts have lobe ends and are of fixed length. The rear truts are from the stationary rear axle to the ountershaft journal boxes, and have right nd left screw-threaded, turn-buckle adjustnents, with check-nut retention.

The disk shaft is telescoping and universally

lubrication by mechanical oiler. These de are expected to be changed to gear dri for the fan with hammer-spark and gear-dr magneto and two-pinion oil pump lubrica constant oil circulation through unobstru piping to the cylinders and the fan-shaft and oil return to the oil well in which th pinion oil-pump is submerged.

The motor cylinders are only $3\frac{3}{8}$x$3\frac{1}{2}$

The cranks are set at 120 degrees, and the working piston diameter is $3\frac{3}{8}$ ins., the annular supply pistons are $4\frac{7}{8}$ ins. dia. outside, $3\frac{3}{8}$ ins. dia. inside, and have a displacement of 33.25 cubic inches, while the cylinder cubic contents above the exhaust port is 31.99 cubic ins., thus making the charge volume about four per cent. in excess of the cylinder capacity.

The two-diameter pistons are shown as constructed in the first model, with two snap rings at the top end, a single wide snap ring above the piston pin and two snap rings in the supply piston. The connecting rod is 8 ins., center to center, something less than $2\frac{1}{2}$ strokes.

$\frac{1}{4}$, then the supply piston will make ne its upward travel before the working cyl intake port opens to receive the charge, might have from, say, 12 to 15 lbs. gaug 27 to 30 lbs. absolute pressure, at the ti working cylinder intake port opening w not for the cubic capacity of the transfer sages, which is considerable for the two passages, and very much greater for th long passage from the No. 3 to the No. inder.* Because of all this, the actual c pressure at time of working cylinder i port opening may be from 5 to 7 lbs. fo

Fig. 3. Euclid motor in place on chassis, left side view, the charge transfer pipes from the charging cylinder motor cylinder to the following motor cylinder are plainly shown, the charging pipe from No. 3 passing outside of the harging pipes to No. 1 intake. A compression release cock is fitted near the top of each cylinder. The exhaust fan nd the tank are also shown.

Automatic valves opening to the three sup-ly cylinders are placed at the supply cylinder ntake ports and other three automatic valves, pening out of the supply cylinders, are placed n the supply cylinder delivery ports, so that o portion of the charge once delivered to the ransfer passages from the supply cylinders o the working cylinders can return to the upply cylinders. These two automatic valves tted to each supply cylinder causes a con-nuous suction of charge mixture through he carburetor, ensure equal filling of the harging cylinders in the suction stroke, equal upply-cylinder discharge volumes to the harge transfer passages and equal charge olumes delivered to each working cylinder fter the crank-shaft has made a single revo-

inders 2 and 3, at a guess, and from 3 to 5 for cylinder No. 1.

When the working cylinder intake opens the incoming charge pressure will rapidly as the working cylinder is filled the remainder of the charge will be transfe at a little above atmospheric pressure.

As will be seen from the illustrations air-casing covers most of the piston trav the supply cylinders, but does not surro the exterior, applied, transfer pipes. In p tice these transfer pipes are only moder heated by the passage of the compre charge and though quite warm to the t can be handled without discomfort.

Fig. 4. Euclid Runabout, rear view, showing steel tube chassis frame and friction drive. The body sills rest o
tside of the frame tubes, and dropped low down, so that the body sills go outside of the frame tubes and below them
tirely hiding the tubular construction.
The friction drive is ordinary practice. The half-elliptic rear springs are to be changed to platform springs. The d
ains are very short.

Increase of working cylinder intake port, ngth and increase of working cylinder offset, oth diminish the charge pressure at the time working cylinder intake port opening.

Mr. Palmer says that this motor unaded has shown 2,500 R. P. M. without bration, all three pistons equally well icked and all the spark plugs working ually well, but that if one cylinder ntinuously fails in working, the exected vibration occurs.

Probably the charge compression at e time of working cylinder intake openg, is not greater than it should be to sure the entering charge against transr passage explosions. The vigorous sh of the charge into the working linder as soon as the intake port opens fects a very rapid cooling by expansion. e "cold-air" compression is calculated be about 65 lbs. in the working cylinr at the end of the working piston mpression stroke.

THE MOTOR.

The crank-shaft journals and wrists e all 1½ ins. diameter. In view of the nsiderable piston weights it would seem visable to give all the crank-wrist ngth safely obtainable; this dimension 1½ ins., crank arms ¾ ins., and interediate shaft journals 2½ ins. long. The anks are set at 120 degrees apart.

The vertical section shows ribs much thicker

The cross-section clearly shows the su cylinder automatic intake valve construct while the working cylinder port construc is shown by the section on B A. In this

1908 Austin Models

6 Cylinder Austin, 90 H. P.

6 Cylinder Austin, 90 H. P.

The 1908 Austin Models are designed to exactly meet my own personal requirements after 6 years of building high grade cars, and to fulfill the ideas of that class of owners who want the "sportiest" kind of a car it is possible to get with *all* the power and speed they can possibly use—a car that is either a touring car or a runabout capable of making a 1000 mile trip any time, and will beat anything on the road.

Our 6 cylinder 90 h. p. model is my idea of such a car—and I believe it stands today without an equal in the Automobile world at any price.

Our new combination body as a touring car has an extra folding footboard chauffeur's seat. The tonneau seat can be replaced in 3 minutes by a rumble seat, thus converting the car into a runabout of the very latest design.

The equipment is complete in every respect, and includes both seats, and extension surrey top for the touring car, and single top for the runabout. We also furnish this new combination body on our regular 60 h. p. model in place of 7 passenger touring body. This regular standard body, either with or without detachable limousine top, will be furnished on both 60 and 90 h. p. models.

All Austin cars have the celebrated Austin Motor and are built in our own shops under my personal supervision.

Send for Catalogue and detailed information about our new models.

Digitized by Google

The 6-bladed 11-inch fan is driven about 5) 1 by a flat belt in this first model; this belt ill be replaced by a toothed-gear drive with ı interposed friction in the next model. The anes are 3 ins. wide x 3 ins. radial length, et at about 10 degrees angle to the radius, ith the inside end of the vane leading. The elivery opening in the fan-case is 3 x 3¼ ins he opening from the cylinder casing to the ın casing is about 6 ins. dia. This fan gives strong suction and the cooling is regarded as holly satisfactory.

This Palmer 2-cycle, air-cooled motor is too ecent a construction to have been exhaustively ested, but it gives every indication of superrity.

The torque is the same as, or better than, aat of a 4-cycle, 6-cylinder motor, with a 3-ırow crank, no cam-shaft, no cams, and only ıtomatic valves handling the cold mixture e used.

This at once does away with the cams, camaft, cam-shaft gears, water-pump, water, ıd radiator, and produces an engine with fully warranting this first published des tion, although both motor and car will be considerably changed in the next m before offering to purchasers.

ON THE ROAD.

There was no opportunity to make a run on this first Euclid car, which had on tester's seat with no foot-board on the ch at the time of the writer's visit. The car been driven about 800 miles total, and writer had several runs of a few miles e Mr. Palmer driving. The motor is si save for the humming of the fan. whic barely audible, and there is no motor bration whatever, as the torque is contin and does not vary largely. The motor h very large range of speeds and is, of co strong on low speeds.

In every particular the motor working formance was all that could be desired and cooling is so efficient that the air-jacke contact with the exhaust pipe is never enough to burn the hand.

1908 Bailey Electric Victoria Phaeton

The S. R. Bailey & Company of Amesbury, ass., U.S.A., offer a unique small electric ehicle for city use in their 1908 Phaeton hese well known carriage makers embody in is vehicle all the points of superiority of their orse-drawn bodies and furnishings. As will be en from the accompanying photograph the carriage is extremely graceful in outline trim in appearance.

GENERAL SPECIFICATIONS.

The machine has a wheel base of 78½ and 34-inch wheels fitted with 3½-inch both on front and rear. The battery con of 30, 9-plate cells, 60 volts. A 2½ to 7 H motor is used and the drive is by double chains. The vehicle weighs complete, lbs., and sell for $2000.00

The Autocar

Established 1895

The Leading British Motor-Car Paper

Established in advance of all others and still far ahead of them all

Profusely Illustrated

¶ "The Autocar" provides week by week, an interesting and authoritative review of the progress of automobilism in the United Kingdom, and should be read by every progressive maker and dealer, who "knows how" to benefit by the experience of others.

he frame is a combination of sheet, rolled and orged steel made in very graceful curves by hich the effect of the drop frame with more rtistic lines is secured. The "Bailey Pivot xle" are of the company's own manufacture. hese have been used for twelve years in our orse drawn vehicles, where they have records is said of running for three years on a table-poonful of oil. The same principles of con-truction are embodied in the automobile axle, ut, of course, with a different design and roportion. The wheels are of the artillery ype also manufactured by the company, a ovelty being that the hub plates holding the pokes are made integral and united by webs nstead of being bolted through as in the case

Fig. 2. 1908 Bailey Electric Victoria Phaeton front ew, showing the "Bailey Pivot Axle" and the special ailey control arranged on the steering wheel in a similar ay to that of a gasoline car. The wheels are made by the ompany and the hub plates which hold the spokes are tegral and united by webs instead of being bolted. Steel ms with rivited on metal sockets the spokes are used. he battery is underhung below the floor of the vehicle, the eight being midway between the axles.

f ordinary Archibald or artillery wheels, so-alled. No wood rims are used, the ends of he spokes being inserted in thimbles or sockets iveted to the steel channel. These wheels are omewhat lighter and, the makers state, con-iderably stronger than the ordinary type.

The battery is under-hung, being directly nder the floor of the vehicle, the object being o carry this heavy weight low and as nearly idway between the front and back axles here there is the least motion. The plates

differential are used.

PECULIAR STEERING AND CONTROL.

The particular novelty of constructio however, in the steering apparatus. Alt wheel steer is supplied if required, the ma claim the lever, or swinging, steer is better quicker. A D shaped wheel is mounte the steering column, quite similar in ap ance to the ordinary wheel steer, but the w column swings from side to side, thus actua the front wheels. The leverage is ten to and is supported by bearings, so that no tr or vibration reaches the hand of the ope and the backlash may be adjusted. The troller is operated by a rod extending through the steering column and by a appearing on top of the steering wheel i actly the same manner that the spark l appear in the gasoline car. This brings steer and control of the speed right unde or both hands at all times.

The brake and controller are interlo so that when the brake is set the power not be put on, not only this, the applic of the brake throws the power off. Th any emergency a stop may be mad simply setting the brake.

Accidents are also guarded against a running plug cannot be inserted when controller lever is in any other position neutral this interlocking arrangement considered very important.

BODY CONSTRUCTION.

The body is of novel construction a made of bent, laminated wood in the pany's factory. It is very large, meas 48 ins. across the seat, but, neverth weighs only 30 lbs. in the wood. The t full Victoria of the most correct style in it is claimed the finest long grained leathe upholstery and the highest grade of cloth that is manufactured are used. green and maroon broadcloths are the materials altho other materials and will be used to order.

Referring to mileage, the company no mileage claim beyond the standard miles, and states that it does this advis believing it a great mistake to lead the p to expect great mileage from electrics. vehicle it is claimed, is of lighter ca weight for its size and capacity than any is made and the bearings are of the hi possible type and it is probable that i make a longer mileage run than any

Fig. 3. Rear of 1908 Aerocar Model F motor and clutch showing the small size of the multiple disc c assembly in its disc and oil-tight housing. The Spicer extra heavy universal joints are also flexibly housed are dust and grease tight. There are 42 alternate steel and bronze discs in this clutch and extreme smoothne action is claimed.

speeds forward and reverse, packed in a heavy oil in an aluminum case, is used. From this the power is transmitted through a horizontal shaft drive to the rear axle. Two universal joints are employed merely to allow for the action of the springs. A bevel gear floating differential is contained in the rear axle.

There are two brakes, the transmission brake, which is applied with the right foot lever, and the emergency, which is of the internal expanding type with a camel's hair belt facing in the rear wheel hub-drums. The car seats four persons and is finished in Quaker Green with an Italian Red gear and black upholstering.

The Model "E" touring runabout, which was described and illustrated in our June, 1907, issue, page 90, is built upon practically the same chassis as the Model "D", with the exception that it has a wheel base of 105 inches. On this car the battery box is carried upon the right running-board and the tool box upon the left. These are covered with rubber and bound with brass, the same as the running-board, the floor of the car and the platform at the rear, which makes of them a convenient step for attaining a position in the rumble seat.

The rumble seat is of a removable design. By loosening two bolts it can be set off and enables the owner to carry considerable baggage upon the back

with the low build of the machine, it an exceedingly racy appearance.

A dependable car
A responsible maker

Over half a century's reputation for honorable and orthodox business methods should appeal to every prospective purchaser of a car, and to every live dealer with an eye to the future. *The STUDEBAKER* policy may be summarized in four words

"Good, or Made Good"

It's worth much to know that the firm that makes your car is *both able and willing* to give you a square deal.

Studebaker

Automobile Co.

Digitized by Google

multiple disc type with 42 small, thin discs alternating steel and bronze. They run in a bath of oil and are also released instantly by flat springs. It is claimed this clutch is so effective that it enables the loaded car to be started on the high gear even when stopped on a side hill and allowed to start to run backward.

The transmission is of the sliding gear type with three speeds forward and reverse, while the drive is a horizontal shaft, eliminating any unnecessary friction by constantly working the universal joints which allow for the play of the springs. The differential is of the bevel gear type as in the other models. There are four brakes, each applied upon the rear wheel hub drums. The running brake works thru the right foot-pedal and is of the contracting design. The emergency brake is applied by a hand lever and works thru an improved equalizer, the expanding bands in the rear hub drums. This Aerocar brake equalizer consists of a gear wheel between two flat gears operating similar to a bevel gear differential, and causes the brakes to be applied absolutely even upon both hubs regardless of any difference in adjustment. This practically prevents skidding. The wheel base is 115 inches, the tread standard, and the tires are 4 by 34 inches. The car seats five persons with an abundance of room for baggage in the tonneau. It is finished in Royal Blue with a Cream Gear and black leather upholstering.

One of the most striking features of the line for 1908 are the prices. These have been reduced to such an extent that at the recent Chicago Show they created almost a sensation. The Model "D" and Model "E" are being listed at $1500, while the Model "F" is only $2200. It is claimed this is the first instance in the history of the trade where a high-grade, dependable, 40-horse power car has sold for this low figure.

It is stated by C. A. Benjamin, General Manager of the Company, that still a fourth model, which is expected to make a sensation, is now being perfected.

Tests on Oil Cooling

The following brief description is taken from data sent us on tests made by H. B. MacFarland, Professor of Applied Mechanics and Thermo-Dynamics, Armour Institute, Chicago, in the Knight and Kilbourne shops, Chicago, on the Owen Thomas system of oil cooling, in the interest of the Owen Thomas Motor Car Company, of Chicago and Jonesville, Wis.

The tests were to determine the effectiveness of different types of radiators with both water and oil and different velocities of air and to compare the efficiency of the new oil cooling with water cooling on the same engine and under similar conditions. Many private individuals have used oil cooling in winter, and the Hart-Parr Company, of Charles City, Ia., has used it on its gasoline traction engines, but so far as the writer is aware the Owen Thomas is the first automobile specially designed for oil cooling. The preliminary physical and specific heat tests upon which the system is based were made on the oil used, by Professor C. M. Wilcox and Virgil Oldberg, of Armour Institute.

To obtain in a scientific manner data that would be of value, the tests were carried on for three weeks and each test lasted several hours. In all, 35 separate tests were made.

As soon as conditions were constant, readings were taken at minute intervals for at least ten minutes in order to get average results. Automobile conditions were approximated as far as possible. Air was forced against the radiator by means of a blower, with rheostat arranged to give air velocities of from five to forty miles per hour. The actual power developed by the motor was measured with a prony brake.

Using water, four types of radiators were first tested, and, it is claimed, showed 10 per cent. higher efficiency for radiators in which the surfaces were sweated together as compared to those not soldered, and that the heat dissipated by the extended surface—that is, surface not welded—is very small, so that the extended surface could be materially decreased in most radiators with little or no decrease in the cooling effect. Increasing the initial temperature of the jacket water to the radiator increased the engine efficiency and also the heat dissipating effect of the radiator. As the radiators were plugged to prevent evaporation, a continued run at much power would have boiled the water. This point did not appear when using oil, the boiling point being about double that of water. Using the same radiator with both water and oil, it was found that with a temperature drop of 16 degrees with oil the radiator gave a cooling effect of 700 heat units; when water was used only 70 per cent. as much heat was radiated, although the air velocity was raised sufficiently to give a temperature drop of 25 degrees. Another radiator gave the same cooling effect with a temperature drop of 40 degrees for water and 18 degrees for oil. All the radiators used were standard makes, designed for use with water. The results of the tests indicate that the best radiators using oil on this system are 50 per cent. more effective than they are with water under ordinary conditions. The engines also can be made more efficient because oil can be used at a much higher temperature than water in the jacket without boiling, and there is no danger of freezing or of lime depositing on the surface. It was found that the radiator which gave the poorest results with water gave the best with oil and that the best conditions of circulation for water and oil are very different.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

Exclusive Features of the White Limousine

The exclusive White quality of absolute noiselessness of operation is of particular advantage in a limousine because, in a car with a closed body, any noise made by the mechanism is even more noticeable and annoying than in an open vehicle.

Another exclusive White quality—namely—genuine flexibility of control, permits of the machine being guided safely and speedily through the crowded city streets. The speed of the White may be accommodated to the exigencies of street traffic without any changing of gears, jerky starts or the embarrassing and sometimes dangerous "stalling" of the engine.

As regards graceful lines and luxuriousness of equipment and finish, the White limousine must be seen to be appreciated.

so arranged as to prevent side-sway of the car-body. The Studebaker 40 platform spring connection links are drop-forgings, the link pins are 7-16 dia. hardened, pinned in the split-pins.

THE CHASSIS FRAME.

This is a prest steel channel section construction, greatest depth 4⅛ ins., un thickness 3-16, hot riveted thruout, all placed hot and pneumatic hammer he The frame length is 154 ins., front sp eye to rear end of frame. The frame are parallel, 32 ins. over all width. The frame is channel section, 1½ ins. wide ins. middle depth, end depths 1⅞ in ins. long, 20¼ ins. over all width as a bled, stock 3-16 thick, sides support each end only. The sub-frame sides ar to the chassis frame sides at the mid-p by channel section prest steel dis blocks and thru rivets. The motor and box are supported on the sub-frame by lugs each, no "3-point" support.

The chassis frame and the sub-fram heavy, are well put together, and have greater strength than is usual for ca this size. All gussets are integral wit cross-members and the frame assembl done in the car factory, the prest steel only being supplied by the frame make

THE MOTOR.

This is 4 cylinders, vertical, 4-cycle, w cooled, 4¾x5¼ ins., 70 lbs. compressio B. H. P. at 1000 R. P. M. The rods are ins. C. to C., 50 carbon steel drop fo rod-bodies.

The piston pin is tool steel, hollow, ened and ground, 3 diameters, 1 in., 1½ 1 1-16. The piston hubs are bored 2 di

Hosted by Google

Digitized by Google

holes drilled thru from end to end.

The top ends of the rods are hardened and lapped to fit the hardened pins, no bushes whatever are used. The top of the rod has a V-groove oil catcher cut across the top. The crank-shaft wrists and bearings are all 1 13-16 ins. dia., all ground. The wrist-ends of the rods are bushed with Parson's white bronze half-boxes, capt metal to metal, marine ends, two bolts in each rod cap, castelated nuts and split pins.

The motor base and oil basin are aluminum castings. The oil basin has two oil pits, with no direct oil supply. The splash pool depth is regulated by adjusting the 6-lead mechanical oiler, gear driven from the cam-shaft, fiber gear on the oiler shaft, gear reduction 1 4-10 to 1 from cam-shaft to oiler.

The oil basin has an overflow at maximum splash pool depth, with a cock which shows oil when the pools are filled to maximum by pouring oil into the crank-box.

It is claimed the engines are built in the best manner thruout, are tested against dynamo resistance and are not passed until they show more than the nominal H. P. rating.

IGNITION.

This Studebaker 1908-forty continues the hammer spark ignition which has been so

reserve is fitted.

THE CLUTCH.

This is an 8 deg. angle aluminum leather faced, with cork inserts and 14 ual engagement springs under the l facing at the small end of the cone.

A short double universal jointed tel ing shaft is placed between the clutch hub and the line-shaft; two threaded excluding sleeves, one at each end shaft, can be unpinned, making it po to telescope this universal joint sh itself and permit its removal, wher clutch cone screw threaded casing moved, thus enabling the cone and assembly to be taken out. The clutch compression is about 180 lbs.

Fig. 8. Studebaker 40 chassis, left side of motor, showing the ribbed exhaust manifold, fan mounting pump tion and drive and the water piping. A vertical pipe enters the middle of the cross pipe which supplies ea the twin castings.

THE SLIDING GEAR.

This speed change gives 4 speeds fo and a reverse, direct on third speed. gears are all made from 50 carbon ste 5, d. p., all 1 in. face, all oil tempered.

The side-shaft and line shaft are on S annular ball bearings, balls about dia. and ¾ in. dia., respectively.

The reverse is obtained, not by slidi intermediate pinion, but by mountin pinion in a forked arm which is rocke way or the other to engage or dise the reversing pinion, an arrangement

Important to Dealers

here's a heap of satisfaction in sell-
a car you can stand back of—a car
se endurance and serviceability have
it such prestige that a well-known
er writes: "Put the name **'Northern'**
nything, and I can sell it."

business built on Quality has a
foundation—it's bound to grow—
d to be profitable for everyone con-
ed.

considering what you will sell
ng 1908 you can't profitably overlook
ilent Northern. It stands pre-eminent
ng medium-priced machines.

emember that the Northern is the
car with this notable record: **Five
rs in the hands of the user**—and
the best-built, best-finished, best-
ing, most efficient, most popular—
test two-cylinder car in the world.

or 1908 it embodies **more power**—
ter refinement.

It still includes the original feature
which made it the leader of its class—
"Northern" three-point Motor Support;
"Northern" double-muffler system;
"Northern" encased mechanism — al
placed under the hood, where it is easil
accessible; "Northern" direct drive, an
"Northern" 24-inch fly-wheel—placed i
front of the engine.

You can't get any idea of Silen
Northern qualities by acquaintance wit
ordinary two-cylinder cars. The Silen
Northern isn't an "ordinary" car—no
designed like one—not built like one—
doesn't ride like one—rides like a "six"
quiet, smooth, vibrationless.

Costs no more for up-keep than th
average "one-lunger" and is the simplest
strongest, quietest two-cylinder car in th
world. Four bodies, one chassis.

Special. A few good locations ope
for **live** dealers. If you're wise, you'l
write us. Let's hear from you today.

NORTHERN

Digitized by Google

The Monarch Motor Car Company, Chicago Heights, Illinois, U. S. A., will offer for the season of 1908 a single model of chassis, four cylinders, four-cycle, water-cooled, 40 H. P., wheel-base 112 ins., tires all 36 ins. x 4 ins. fitted with either a five-passenger touring body or with a roadster body to seat four passengers; weight 2300 and 2200 lbs. respectively; price with either body $2500.00.

The present Monarch Motor Car Company was organized in March, 1906, to take over and exploit the patents and inventions of Mr. J. J. Boucher, Chicago, Illinois. Mr. Boucher had been designer with a former "Monarch" auto company, of North Aurora, and had brought out a previous Monarch model, a single-cylinder, air-cooled, two-passenger car, offered at $500.00. This first Boucher car looked like a success, but was managed by officers ignorant of the automobile trade, passed into bankruptcy and expired. Mr. Boucher attracted the attention of a group of Chicago financiers who formed a company with a real-money capital of $150,000.00, elected a well known Chicago lawyer, Mr. T. A. Quinlan, Jr., president and general manager, engaged Boucher as chief designer and supervising engineer and began productive operations in

16 H. P., priced at $600.00, $750.00, $8
and $900.00.

All these first four 1907 Monarch r
were two passenger runabouts, diffe
in springs and bodies making the price

Monarch model a new form of right-and-left-crew steering action, and universal joints of his own design, and has treated the motor-base and cam-shaft support in an original manner.

THE NEW MONARCH FACTORY.

The Monarch Company is financed by courageous and determined stockholders, who did not permit disaster by fire to delay operations. Immediate housing was obtained at Chicago Heights in an already-built factory. Chicago Heights is a town five miles square, projected 1899 as a manufacturing center, sufficiently removed from Chicago to be clear of unfavorable town influences and yet close enough to the greatest American railway center to obtain full advantage of competing lines of transportation, and now having some 13,000 inhabitants exclusively manufactory owners, operatives and suppliers.

are placed at the rear, next to the rear ing of the crank-shaft. This brings al large housings of the gears and fly-whee gether, close to the motor-base and so f the base-lugs, the cam-shaft gears-casing fly-wheel casing and the change-gear-box the least possible weight of aluminum cast The fan is placed on top of a hollow, alum casting pillar, and is bevel-gear driven the crank-shaft, 2½ to 1; placing the cam-gears at the rear leaves the whole front c motor open to the fan-blast. The cranl and gear-box ends are flanged, open diar larger than the fly-wheel diameter, anc shouldered together so as to ensure a support and correct alignment of the constructions.

The universal joints have no pins anc together, two forks going into the br casting-cross with finished grooves at angles to each other.

The bevel-pinion is fixed to the rear e the propeller shaft, with a universal joi

Fig. 2. Monarch 1908 Roadster, to seat 4 passengers. Same chassis specifications as Fig. 1. Weight, 2200 lbs. $2500.00, with 5 lamps, mats, horn and tools, all ready for the road.

This workers' town is surrounded by a belt-line railway with sidings into every factory, all switching charges borne by the trunk line railways, with a flat rate of $5.50 per car to Chicago by five competing lines of transportation. Chicago Heights gave the Monarch Company a five-acre plot and home-made bricks for a factory, the first section of which, 350x60 ft. brick walls, cement floors, saw-tooth-roof-lighted, tiled, with iron girders, all absolutely fire proof, is just finishing at the time of this writing, November 29, 1907, and will be occupied by the Monarch Company before January 1st, 1908.

THE
'Nightingale Whistle"

vill melodiously demand the right of way over all ther warning signals. Its sound is a six-note thrill, hat penetrates for miles and does not shock the ear

can be attached to any make of car by the chauffeur. A small standard thread bow is all that is needed. When not sounding, the whistle remains closed, eeping out all mud and dirt, and, in addition, it automatically cleanses itself after ch signal. The cap on the end of the exhaust pipe closes one second be-re the whistle opens.

It operates from the dashboard with either a hand pull, lever or pedal.

Catalog No. 24 gives all particulars and price.

For sale at all supply houses.

THE
'Tire Inflator Delpeuch"

Size 11x5 inches. Guaranteed for 3 years.

Made of Metal Throughout
No Leather Packing

Bored and fitted with a metal piston, just like a motor cylinder. It lasts for years. Automatic lubrication with grease cups. Attaches to any make of car by means of split gear on driving shaft, and is operated by a sliding pinion. Control on ashboard.

Hosted by Google

The "Tire Inflator Delpeuch" will inflate the largest tire in one minute.

ious sheet-steel dust-pan under the motive ssembly. The single universal-joint and propeller-shaft sleeve-fork are covered by a lexible leather bag. All the dust casings are ubstantial and the fly-wheel and clutch are ully enclosed and perfectly protected. This lust protection is highly important and is vell carried out.

in capped seats, integral with the motor The forked, cylindrical valve-lifters hardened rollers, $\frac{7}{8}$ dia. on hardened $\frac{3}{8}$ the lifters, and flanged sleeve-nuts, scr into the open top ends of the lifter gu form the abutments of the lifter-springs

The valve stems and heads are int steel forgings. The ports are all $1\frac{5}{8}$ ins

Fig. 3. Monarch 1908 Chassis plan. The chassis frame is in two widths. The assembled motive unit is sup n the middle of the chassis frame front cross-girt, and at the O G bends of the chassis frame. This supports the moti t 3 points, so that frame twists are not transferred to the motor base and sliding gear casing. It is common practice port the motor at two points in front and one point in the rear, which calls for more weight of motor base and separat orcing for the frame—side bends.

THE MONARCH MOTOR.

The cylinders are single units, symetrical, valves on each side, valves worked from two cam-shafts.

THE CAM-SHAFT.

The crank-shaft pinion fills sidewise between two crank-boxes and is held from turning by one Woodruff Key. This crank-shaft pinion has 33 teeth, 8, d. p. The cam-shaft gears are a $\frac{1}{4}$ web of steel in the middle with $\frac{7}{16}$

The top ends of the lifters and the lower of the valve stems are hardened. The no length-adjustment for the valve-action

The pistons, $4\frac{3}{4}$ ins. dia. by 5 ins. s have four snap-rings above the piston The pistons are a straight taper, $2\frac{1}{2}$-thousa small at the lower end and $5\frac{1}{2}$-thousa small at the top ends. The piston pin $1\frac{1}{8}$ dia. with $\frac{5}{8}$ holes clear through, hard and ground, held by tit-set-screws with

We are now well settled in our new factory and READY TO SHOW RESULTS.

Prompt delivery and constant improvement in quality.

In our effort to possess the finest chain plant in existence and to maintain the highest degree of Accuracy, Efficiency and Finish, we are going to the very limit.

We will now make all sizes of Roller and Bushing Chains for which there is a reasonable demand.

If you are not taking advantage of The Woodruff Patent System of Keying, it is high time to investigate same. It has been adopted by most of the leading automobile manufacturers, who report better results and a great saving in cost.

Hosted by Google

he model 40 is mahogany and embellisht vith heavy brass molding so placed as to be ree from vibration. The toe board angle has been raised so that it forms a very much more comfortable rest than in former models.

THE AXLES.

The arrangement of the engine transmission and rear axle is such that the drive is a straight line, making the wear on the universal joints practically nil.

The live rear axle is fitted to the master gears in the differential by means of squared ends and run on Hyatt roller bearings with special ball thrust bearings thruout. The front axle is drop forged of I-section, with an extra heavy spindle with ball bearings, ¾ in. balls being used in the inside bearings and ⅝ in. ball in the outside bearings.

The springs are semi-elliptical in front and three-fourths platform suspension in the rear, with Sager auxiliary recoil springs on the rear axle as shock absorbers.

The wheels are of wood of the artillery type and are fitted with Midgley universal rims. The tires used are the same both front and rear. Two sets of brakes are supplied, both acting on the rear hubs. They are very efficient, either set being capable of causing the wheels to slide with but slight pressure.

The hubs are extremely large and the

IGNITION CHANGES.

One of the most important improven has been the adoption of the Atwater- spark generator. The introduction of th nition device, according to the company produced really startling results in mil with dry cells. In every test made by company the 1908 Elmores, fitted with ignition device, made over 2000 mile one set of six, No. 6 dry cells, which is a remarkable showing.

The gasoline tank will carry 20 gallo fuel and the oiler will hold six pin lubricating oil. The Elmore 40, it is c ed, will easily average 12 miles to the g of gasoline. The tread is standard 5 and the wheel base 109 ins. in the 4-cyl car, and 102 in the 3-cylinder car.

Special importance is laid upon the more lubrication. The oil is forced int intake pipe by the mechanical oiler, so the distribution to all the cylinders mu uniform.

The carburetor is of the float-feed matic type.

The spark and throttle control remai the top of the steering wheel, as form and the transmission used is of the sele type, three speeds forward and reverse

The specifications for the Elmore 30 for the Elmore runabout are identical embody the same excellency of design characterizes the Model 40.

The 1908 Maryland Cars

The Sinclair-Scott Co., of Baltimore, manufacturers of the Maryland Car, are offering for 1908 three types, viz: A 5-passenger touring car, 6-passenger limousine and a 2, 3 or 4-passenger roadster. The only changes for 1908 are in bod finements and general finish.

The general mechanism remains tical with that of 1907. The motor 4-cycle 4-cylinder one, with a bore inch and 4-inch stroke, developing H. P.

Half-Nelson Emergency Tires

ill STAND UP on any kind of roads as long as any other tire, at a COST which a NGLE EMERGENCY helped out of—will more than pay for.

The tires are made of six sections of metal and wood with a tread of solid rubber as own. The sections can be attached to each other and the wheel in less than one min-e. They can be carried anywhere about the car, together or separately. A casing car-ed upon a car deteriorates faster than when used, as anybody knows who has carried e six months or a year and then put it in service.

We have many testimonials, but space to quote two only :

"MINNEAPOLIS, MINN., JUNE 14TH, 1907.

My auto livery business compels me to have my cars ready to go and stay on the road at all times, and your emergency tires, with which my cars are equipped, have settled the tire problem definitely. Your tire is an invaluable part of every car's equipment."

CARHART AUTO LIVERY CO.

200 E. SEVENTH ST., ST. PAUL, FEB. 4TH, 1908.

AL,F-NELSON TIRE CO.,

Gentlemen:—In regard to the Half-Nelson Emergency Tire, I wish state that I purchased one last summer and it certainly came in handy ew times. If I could not replace it I would not sell it for five times e amount I paid. Yours very truly,

ERNEST A. JACKSON.

Send for the Half-Nelson Emergency Tire. Try it. If u are are not satisfied after ten days' trial, we shall return ur money.

"Remember that the complete ruin of a punctured tire n be accomplished in a ten-yard run."

cone clutch with cork inserts is used. The wrist pins are hardened and ground tool steel working in hard phosphor bronze

Fig. 4. Rear view of dash 1908 Maryland car showing the timer at the center mounted on the rear of the overhead cam-shaft, the coil and force feed oiler also mounted on the cast aluminum dash. The clutch is of the ordinary leather faced cone type with cork inserts. The contract levers are also shown and consist of a clutch pedal, brake pedal at the right and emergency brake lever and change speed lever at the outside. Spark and throttle are one stationary sector on the large eliptical grip steering wheel.

bushings. The main bearings and crank-pin bearings are of Parson's white brass, peaned and scraped.

The arrangement of valves in top of cylinders of motor gives the greatest efficiency of any known, and on actual test these moters run up as high as 28½ and 29 H. P.

THE TRANSMISSION.

The transmission is of sliding gear type with three speeds ahead and one reverse, direct on high gear, both shafts mounted on bearings of Parson's white brass. The whole being enclosed in an oil tight and dust proof aluminum casing.

ENGINE AND TRANSMISSION SUPPORTS.

Between the engine and transmission case is placed a full universal joint system, which allows ample freedom for any possible miss-alignment due to road inequalities. The method of suspending en-

is through a cardan shaft with uni joints at either end.

AXLES.

A semi-floating rear axle with spur differential is used, the shafts of w run on six "Maryland" solid conical er bearings. No torsion or strut rod used, drive being entirely through elliptic springs which are secured to frame by broad spring pads, with spring clips. Front axle is I section forged steel with Timpken roller bea and steering knuckles.

The steering gear is of the irreve type, which prevents any jar or vibra incidental to travel over rough road ing transmitted to the hands. Upon steering wheel is mounted a static sector, around which moves the thr and spark levers.

The front springs are semi-ell rear-full elliptic, and are all 38 inches The wheel base of the touring car limousine is 112 inches and the roa 106 inches. The touring car and roa tires are 32 inches by 3½ inches around, and the limousine has 32 i by 4 inches all around.

The manufacturers of the Marylan far as possible, make their own parts abling them to know just what ma and workmanship goes to make up

The Okey Motor Car Company, Columbus, hio, U. S. A., capital stock, $25,000.00, was rganized in January, 1907, to exploit the -cycle motor and various motor-car detail ventions of Perry Okey, who has made a udy of the small gas-engine since 1894, and the writers opinion has built some of the ost notable car-motors ever produced anyhere, both 2-stroke and 4-stroke cycle. key has built only a very few cars, but these ave covered a large range, including two rge 7-passenger 6-cylinder cars to private rder as well as small 2-cycle runabouts, the -cycle being his favorite type, the 1908 odels having such motors.

All Okey cars have been on wood chassis ames and have other notable features testiying to the strong convictions of the designer, ho decides only after extended experiment nd consideration and pays no attention to hat anyone else thinks or believes.

cylindrical aluminum casting bolted to rear end of the crank-box to complete assembled propulsion unit. The fly-w is placed in front and the cylinders are thre in the top opening to take a threaded fla top which is tapped in the middle for spark-plug and caps the cylinder water-ja

THE OKEY MOTOR.

The cylinders and crank-box and integral gray-iron casting, is $\frac{3}{16}$ in. ge thickness, and this casting only weighs, finis 116 lbs.

The three cylinders are each $4\frac{1}{8}$ bore b ins. stroke, and the completed motor shown 3000 R. P. M., unloaded, on the te stand, and 22 H. P. at 1300 R. P. M. weight of the entire propulsion assembl shown, is 370 lbs.

The crank-box sucks from the carbu through a third port, $\frac{9}{16}$ long, open for s thing like 90 degrees of crank-shaft an

Fig. 1. Okey 2-cycle motor runabout, wheel-base 92 inches; gauge 54 inches. Tires all 34x3½ inc Motor 3 cylinders, 2-cycle, water-cooled, 4⅛ bore x 3½-inches stroke; 22 B. H. P. at 1,300 R. P. M. Plane gear to bevel gear and divided rear axles, with spur balance gear. Runabout body to seat two passen only, with side doors to foot space, right hand door fixed shut, left hand door swinging to front. 20 gallon tank elevated in rear of seats. Weight about 2,250 lbs., tank filled. Price $1,400.00 including mat, horn, and three oil lamps.

Every detail of this 1908 Okey Runabout an original design and construction, except he planetary-two-forward-speeds and a reerse change-gear.

Okey first decided on a cylindrical fuel tank o avoid leakage, placed high up in the rear f the runabout seats for two, but as it cuts ff all possibility of placing rumble seats it ill probably be placed in the usual place in uture models, that is, under the drivers seat.

Both front and rear axles are original. The prings are three-quarter-elliptics in front and croll-head full-elliptics in the rear. The drive bevel gear, ratio $3\frac{1}{2}$ to 1. The steering is

advance, giving, say 45 degrees crank intake, and of course 45 degrees of downw piston travel in which the third port is and the descending piston forces mix from the crank-box downward through carburetor throat. If the carburetor th were open, this returned charge would be To avoid this mixture loss, a 2-inch air-in horizontal tube is coupled to the carbu air-intake and is carried back horizon 36 ins., to the space under the driver's where it is turned upward for 9 ins., and open top end of this long air-intake is f with a swinging flat cover, operated

IT FITS THE POCKET

Just issued: an encyclopedia of the automobile trade, in handy pocket size, containing over 100 pages brim full of illustrations and detailed description of all kinds of supplies for all kinds or cars. It is the most attractive book of its kind ever issued and a postal card will bring it.

AUTOMOBILE ACCESSORIFS

Every item we sell is of good quality—that's certain, and yet our prices are no higher than you pay for indifferent or ordinary supplies. We want you to send for our book and let us show you that we can serve you well in quality and price.

MOTOR-CYCLE SUPPLIES

Are described also, and many novelties are shown. We sell the most complete assortment of goods for the motorist to be had anywhere, and we would like every motor cycle dealer and rider to write us for our prices.

BICYCLES ARE SELLING

Don't overlook the fact that the bicycle business increased in 1907 and there is every indication of a big demand in 1908. We carry a most complete stock and do, by far, the largest trade in this line in the East. We are prepared to take care of your requirements and are offering special inducements for early orders. Write for our catalog No. 40—pocket edition, and ask us to tell you about the bicycle we can sell the trade low enough to be retailed at $20.00 with coaster brake.

NEW YORK SPORTING GOODS CO.

Digitized by Google

the swinging cover, to screen the air going to the carburetor. The downward stroke displacement of the piston before closing the third port is about 10 cubic ins., and this volume of mixture is forced downward through the carburetor throat into the horizontal 2-inch dia. air-intake tube. The result is that a corresponding bulk of pure air is discharged from the turned up end of the air-intake pipe with no loss of mixture or fuel from the down stroke of the piston while the third port is open.

The cylinders are offset $\frac{9}{16}$, and the connecting rod is $6\frac{3}{4}$ ins., center to center. The intake ports are $\frac{7}{16}$ long by 3 ins. circumferential width, and the exhaust ports are $\frac{3}{1}$ long by $3\frac{1}{2}$ ins. wide. The crank-box intake port is $\frac{9}{16}$ long by $3\frac{3}{8}$ circumferential width. The water circulation is thermal, large pipes and no circulating pump.

The exhaust is carried into a large grey-iron expansion chamber, cylindrical in form, piped to a long large-diameter muffler, the exhaust silencing scheme depending on constant and rapid increase of expansion room.

THE CARBURETOR.

This is Okey's design, Fig. 12, float-feed and stand-pipe, nozzle $\frac{3}{8}$ dia. with a No. 41 drill-hole in the center of a throat $1\frac{1}{16}$ least diameter, enlarged both above and below the stand-pipe nozzle-top, $\frac{3}{16}$ above fuel-level in the float chamber. This carburetor has no auxiliary air-intake nor automatic valve. The 36 ins. long, horizontal air-intake pipe, as previously described, is coupled to the under face of the 2 ins. dia. air-intake at the right.

There are three rocking cocks placed in the side-pipes, to act as throttles. The hollow cock-shells are fitted with gauze cones to prevent back-firing. All the throttle cocks are linked together so as to be operated together by one rod from the throttle rocker.

IGNITION.

This is by jump-spark plugs, storage battery and 3-coil box on the front-board. The commutator is on a short horizontal shaft, bevel-gear driven from the line-shaft in the change-gear box. The bevel gears are of bronze, and are of large diameter.

LUBRICATION.

No lubricating system whatever, is used, the oiling method being to first partly fill the 20 gallons capacity fuel tank and then add from $\frac{1}{24}$ to $\frac{1}{20}$ the gasoline volume in lubricating oil, poured directly into the gasoline tank. The gasoline at once "cuts" the lubricating oil, and the colorless transparent mixture of lubricating oil and gasoline goes through the carbureter to the crank-box and cylinders, depositing the lubricating oil on the walls of the crank-box and cylinders and oiling every part of the motor except the crank-shaft forward bearing, which is not exposed to the mixture drawn into the crank-box and is therefore fitted with an oil cup and wick to the front-bearing oil-lead. This method of oiling has been used by Okey in all of his 2-cycle motors and during several years of employment has never failed to give entire satisfaction.

BEARINGS.

The crank-shaft, rods and the change-gear shaft have plain babbitt bearings. The front wheels are on 2-point ball-bearings, $\frac{3}{4}$ and $\frac{1}{2}$-in. dia. balls. The rear axles and the pinion shaft are on F and S imported, annular bearings.

The front axle is an I-section bronze casting,

Fig. 2. Okey rear axle, complete. The bevel pinion shaft on F and S annular bearings, is cased in a steel tube sleeve with annular braces to the axle ends. The front end of the sleeve has one member of a large universal joint revolubly mounted thereupon, this sleeve joint being concentric with a Spicer universal joint from the line shaft to the bevel pinion shaft. All gears are of chrome nickle steel, very large, coarse pitch and hardened. The rear wheels are on annular bearings in the plane of the wheel spokes. The gear box is a steel casting, and the pinion shaft sleeve is joined to it by a flange of abundant diameter. The rear wheel brakes are also shown. Hub drums 12 inches diameter, steel casting internal shoes. Gandy-belting faced, applied with a sliding pin having hardened ends, beveled, working on hard rollers in the shoe-ends. This sliding pin is passed through the brake rock-shaft and must apply the shoes equally.

course this method of fuel supplying calls for variable delivery pumps or liquid fuel-feeders of some description.

The pure air charge can be of constant volume, and may be in excess of the cylinder capacity so as to scavenge the cylinder before

Fig. 7. Okey runabout, right side of motor and foot of steering post. The spark and throttle rocker friction is had by coiled spring pressure and fibrous washers, construction indicated by this illustration. Note the form of the water pipes to the radiator.

the exhaust port closes, and fuel injection can begin at any time after the ascending piston closes the exhaust port, and it is possible to internally air-cool a 2-cycle cylinder by passing cold air in sufficient volume through a port in the side of the piston and a short side-pipe into the cylinder out through the exhaust port. Any of the pure air charging methods ensures constant compression, which is highly desirable. The pure air charge with liquid fuel injection has been fully considered by Okey, who favors this method.

CONTROL.

There are two outside hand leverr, and one pedal on the foot board, with a plunger pedal for the muffler cut-out. The outside hand lever is pushed forward to apply the rear-hub ordinary brakes and is latched in forward position; when pulled to rear, it gives high speed forward.

The inside hand lever is pulled to rear for low gear, and pushed forward for the reverse, self-retained in both positions.

The one pedal is pushed forward to apply the emergency, line-shaft brake.

The steering action is Okey's design; a quadruple thread, 1 p. i., is cut on the top end of the steering column, 2 ins. dia. steel tube,

levers, one on each side, under the st wheel, which is 16 ins. diameter.

The steering action is not locked, bu friction and leverage are enough to p the front wheels from sensibly turnin steering wheel.

ON THE ROAD.

Tuesday, Jan. 7, an Okey Runabou the Okey factory, Homer Chandler dr Hugh Dolnar passenger, and proceed Franklin Park, 3 miles distant, where driven 38 laps on a $1\frac{1}{8}$ mile circular 44.33 miles, which with the 6 miles fro to the factory made a total of 50.33 The whole route was nearly level, over ment to Franklin Park track, which is smooth gravel. The level course and ci track were unfavorable to high mileage. 44.33 miles on the Frankiln Park circular were covered in 105 minutes. 3.08 g of gasoline were burned, giving 16.3 travel per gallon. The weight of the ca the two passengers up and tank full, wa lbs., giving about 21 ton-miles to the of gasoline. The time on the circular was 2.37 minutes to the mile.

The level course and circular track wer unfavorable to high mileage, as the had to work all the time. The best m

Another Maxwell Model

A new member has just been added to the Maxwell line. This new Model K Maxwell Roadster follows, in general construction, the Model D, whose chassis has been utilized with the minor modification of the frame arches, and the dash, which became necessary on account of the greater angle of the steering column.

THE MOTOR.

The motor is of the four-cylinder vertical four-cycle type, $4\frac{1}{4}$ x $4\frac{1}{4}$ ins., and the cylinders are cast separately, so that five main bearings can be used, the inner three of which are formed by the compartment walls of the crank case. Easy access to the connecting rods, main bearings, etc., is afforded by handholes, four of which are located on either side. The valve chambers and water-jackets are cast integral with the cylinders, and the valves are mechanically operated.

type, the gear sets being enclosed in tight case.

The drive is by shaft, and two cardan possessing the Maxwell self-oiling a ment, to a divided rear axle. A special bearing in the differential takes up side preventing at the same time all backlas

The frame is of pressed steel; tread 56 wheelbase, 96 inches; wheels, 32 inch

LUBRICATION.

Lubrication is effected by a positive feed oiler, in connection with which t automatic lubrication to the engine ca to the transmission. BUFFALO CARBURETOR

is made for.

It comes to your relief when you are about to condemn
very carburetor that was ever made. Let us demonstrate why
e BUFFALO is the one you want.

Hosted by Google

out toward the hubs for the purpose of placing the entire load as near as possible to the point where the rear axle enters the wheel hub.

The brakes are similar to those used in Model D, the external one being a fibre-lined steel shoe of clam-shell pattern, hinged at the bottom, and the internal brake being pieces of well-seasoned hickory, boiled in oil.

The carburetor is of special Maxwell design, float-feed type, and provided with means for automatic compensation. Control of the spark is by a horizontal hand lever located immediately under the steering wheel, and a similar lever controls the throttle. Besides the throttle-control lever under the steering wheel a pedal is provided which also controls the fuel supply independent from the hand throttle.

BODIES.

All Maxwell bodies are made of sheet metal, with stamped mouldings, a construction as light as wood and stronger than aluminum, but not liable to breakage, since dents may be hammered out, while in the case of a paneled wooden body the substitution of an entire new panel is necessary to repair damage. The upholstery is of fine quality leather and hair.

The chauffeur's seat in the rear is of an unusually clever construction, more spacious than the customary rumble seat, and will accommodate two persons, if desired. This back seat may be folded down, and when in this position, leaves the car with a smooth rear deck under which ample carrying space may be found. A large tool chest is incorporated in the extreme rear of the deck, the hinge of the tool-box cover serving at the same time as the hinge upon which the rear seat folds up or down.

The equipment consists of two side lamps, one tail lamp, tools, horn, and tire-repair kit

Price, $1,750 f. o. b. factories.

Creditors In Charge of Knox Automobile Co.

Knox Automobile Co. of Springfield, Mass., is now in full control of officers elected by the creditors who accepted preferred stock in settlement of their claims. The officers are: Chas. L. Goodhue, president and treasurer; Wm. E. Wright, Vice-President; Chas. H. Beckwith, Secretary; Albert E. Smith, Assistant Treasurer. Alfred N. Mayo, the former receiver is on the board of directors. The factory was kept in operation by the receiver from the date of the assignment July 22, 1907, to February 1, 1908, when the new officers took charge. Five hundred thousand dollars worth of preferred stock was issued to the creditors. During the receivership the total sales of cars and parts amounted to $178,883 and the total income from all sources $232,368, while the total expenditures amounted to $224,000.

Albany Automobile Club's Tour

The Albany Automobile Club will hold its 1908 tour, beginning June 20, over the following route: Saturday (the 20th), Albany to Greenfield, Mass., 87 miles; Sunday, to Providence, R. I., 109 miles; Monday, to New Haven, Conn., 126 miles; Tuesday, to New York City, 80 miles; Wednesday, spent in New York; Thursday, to Waterbury, Conn., 92 miles; Friday, to Albany, 103 miles; total mileage, 597

Grout Reorganization

Grout Bros. Automobile Company, of Orange, Mass., has arranged with Mr. Rossell Drisko, late of the Bay State Automobile Co. of Boston, Mass., to take the position of manager of their factory. Mr. W. L. Grout, the wealthy sewing machine manufacturer of Orange has purchased the interest of his sons, who previously had charge of the automobile manufacturing business and has arranged with the new manager to enlarge the business which will include an aggressive selling campaign. This move, no doubt, will be of interest to Grout agents and owners who have been expecting a radical change in the affairs of the Grout Bros. Automobile Company.

Midland Motor Car Company Succeeds Deere-Clark Company

The Midland Motor Car Company, East Moline, Ill., has been incorporated with a capital stock of $100,000, to continue the business formerly carried on by the Deere-Clark Motor Car Company. The assets of the defunct concern were purchased for $35,000. The incorporators are C. H. Pope, A. E. Montgomery and E. H. Guyer.

Mr. Wm. E. Biddle, president and treasurer of the Biddle & Smart Company, aluminum-body builders, died recently at Amesbury, Mass.

H. W. Meyer of Auburn, Ind., until recently in the automobile department of W. H. Kiblinger Co., is now connected with the Zimmerman Mfg. Co. of Auburn.

E. L. De Camp, formerly with the Packard Motor Car Company, has recently taken charge of the Continental Tire Co.'s western interests. He will establish his headquarters at San Francisco.

The Maxwell-Briscoe Motor Company announces that the advertising details will hereafter be handled by Frank Seaman, Inc., 41 West 34th street, New York City, and that Mr. H. A. Grant is no longer connected with the company.

been made, chief of which is the making of the terminals non-corrosive. The manufacturer, Northwestern Storage Battery Co., Milwaukee, Wis., has made this improvement possible by the use of a special connection which conducts the current from one end of the battery to the other before it enters the binding post. This connection is buried and

The 1908 "Northwestern" Storage Battery.

completely insulated with a sealing compound that will stand 183° F. before running and is absolutely acid and water proof. All connections are solid lead-burned and none but the best materials are used in the construction. Another feature of the Northwestern batteries is that each battery is given three bench tests before leaving the factory to insure its being up to standard requirements. The jars containing the plates are made of hard rubber and are set in a nicely finished quarter-sawed oak case, which is put together without nails or screws, the joints all being dovetailed.

BRUSH

Runabout

More people want, and ave the money to buy, the rush Runabout than any her car in America.

A Prediction: Inside of year, the single cylinder ertical will be as great a craze this country as it is now France and Europe.

The Brush is the first of e new style singles. Com- on sense always wins.

Brush Runabout Co.

Matheson

One Year Guarantee

The technical opinions of the best critics of Europe and America, reviewing the general tendencies of automobile construction in the world's leading cars, are given in a book we have just published and which will be sent to any address upon request. This book gives also **some unusually interesting letters of prominent men** of affairs who tell in their own words of the exceptional service qualities of their Matheson cars. These letters are especially instructive, as their authors represent the most experienced class of buyers who have, in many instances, abandoned their foreign cars for the Matheson.

Dealers

are wanted in all localities where Matheson cars are not now represented—write for our very attractive dealer's proposition.

New 4 and 6 Cylinder "Pacific" Gasoline Motors

The Pacific Iron Works, Bridgeport, Conn., have recently brought out new model 4 and 6 cylinder motors designed by their engineer, William Van Wagoner. The new motors have five-inch bores by six-inch strokes, and are conservatively rated 40 and 60 horse power respectively. The connecting rods are 11 inches centre to centre, with crank shaft wrists and main journals 1⅞ inches diameter. The fly-wheel is 17 inches diameter by 5½ inches face, and is put on either by bolting to the flange of the crank shaft or forced on a taper seat on the crank shaft with key, lock nut and pin.

near the fly wheel, the lower end of this shaft being extended to drive the oil pump when one is used. This vertical shaft is driven by hardened steel mitre gears. The crank case and oil pan are aluminum alloy castings.

The crank shaft in the four-cylinder motor has five bearings, and in the six-cylinder seven bearings of Parsons' white bronze, flanged, finished all over, split, retained in position by both flanges and bodies of the bolts, which are screwed down hard on the brass liners.

These bearing bolts go up thru the crank case, the heads being between the cylinder flanges and support the working load, not depending on the rigidity of the crank case to carry the bearings. The

New 6-cylinder "Pacific" Gasoline motor; 5-inch bore; 6 inch stroke; 60 H. P.; a 4-cylinder, 40 H. P. motor of the same design has also just been brought out.

The cylinders are cast in pairs with the valves all on one side, and the cylinders, valve chambers and valve stem guides are all water jacketed. The cam shaft is driven from the crank shaft by hardened steel gears, no intermediate gear being used.

The pump and magneto on the left side of the motor are gear driven, also with hardened gears. The entire cam shaft with cams and bearings can be taken out without removing the main body of the gear case, and the pump and magneto drive shaft can be removed in the same manner.

Annular ball bearings are used on the cam shaft, pump shaft, magneto shaft and the intermediate gear driving the motor, as well as the bearings and yoke ring of the clutch are all ball bearing.

The valve lifters are plain, round, hardened and ground, the ends bearing directly on the cams and the valve stems, no cam rollers being used on any "Pacific" motors.

The timer, or distributor when used, is placed on the top of the vertical shaft

pistons, similar to those in all Pacific motors, have four eccentric snap rings with flat lap, and are all above the piston pin.

The water circulation is by a gear pump, mounted in the center of the shaft that drives the magneto, attached by finger-locked slip couplings that allow of its removal or replacement without interfering with the gear or magneto sections of the shaft. The entire water circulating system is so designed that opening one plug or valve at the cooler will drain the entire system, including the cooler.

The Jeffery-Dewitt Co. of Newark, N. J., have reduced the list price of their "Reliance" spark plug from $2.50 to $1.50, the large demand for this novel plug having reached such proportions that the increased output has decreased the cost of manufacture. This plug was described in our January issue, page 168 and attracted a great deal of attention at the recent shows by its ability to spark in water.

York City, has placed a new valve remover and replacer on the market which he calls the "Real Thing." It is quite simple in construction and is made of bronze. The forks can be widened or narrowed without breaking. It can be placed in position and operated with one hand and, it is claimed, can be conveniently used behind piping if necessary.

This tool consists mainly of three parts, a lever of right angle form (bored with a number of holes along the upright arm and forked at its upper end) and another forked member hinged to the first mentioned lever by means of a pin which can be placed in any one of the holes in

The "Real Thing" Valve Tool.

the upright lever. There is also a thumb screw in the lower forked member, the inner end of this screw bearing against the upright lever. To use the tool it is placed in position with one fork under the collar of the valve spring and the other fork resting on the push rod bushing, the two forks being properly distanced by moving the pin up or down in the upright lever. After this adjustment is made and the upper fork so placed that the cotter pin in the valve stem is between the fork prongs, the thumb screw is tightened up, thus bearing on the upright lever and pushing its lower end toward the engine, which increases the distance between the two forks and so compresses the valve spring, after which the cotter pin can be removed from the valve stem and the pressure on the valve relieved, allowing the removal of the valve. To replace the valve the above operation is reversed.

Substantial Enlargement of Curtiss Motor Cycle Plant

The first building of the G. H. Curtiss Mfg. Co's. plant at Hammondsport, N. Y. was built n 1903 when the motorcycle business was conucted on very modest lines. The increase of he business has made it necessary to add to the acilities, until now the large plant here illusrated is in full operation and running 22 hours day.

There are 25,000 sq. ft. of floor space. The ffices occupying a central position and are conected directly with the stock and shipping ooms which occupy the lower floor of the main uilding.

The Curtiss Motor Cycle Factory.

The frame building, nickel plating and nameling departments are under this roof, as lso is the tin shop. The right wing is used for ssembling motorcycles, while the motors are ssembled in the wing to the extreme right.

Another addition is now in the course of contruction for a testing department. The forge nd brazing shops are in a separate building nd a very complete carpenter shop with power aws, etc. is attached in the rear.

The machine shop on the left is one of the ewest buildings. It is high, airy and well ghted. Its equipment consists of two rows

plied with steam power and heat from boiler room while there are auxillary eo ments of gasoline engines and ordinary s heating plants.

The Curtiss Company not only build its engines and frames but even the frame crank hangers and other small fittings are n in its shops, as well as the carbureter, gaso and oil tanks, handle bars, battery boxes, bags and belts. The plant as it now st has a maximum output of eight com machines per day.

The Leading Motor Cycle City

It is estimated that there are 3000 mo cycle owners in Los Angeles, Cal. A posted Eastern manufacturer of moto cles, to whom the figures were shown, that tho the statement seemed large, he no reason to doubt its truth. "Los Ang is unquestionably," he said, "the gre motorcycle city in the United States, a is probable that there are more mach there than in any other city in the w And next in order in this respect, co San Francisco. The reason is not har find. The Pacific Coast is the wheeln delight, with a season that literally lasts year around. There are more bicycle California cities, in proportion to their than in any other American cities, and

To Be A Success In The Motorcycle Business, You Must Handle A Machine That Makes Good.

If you, as motorcycle dealer, want to extend your trade, you must sell a motorcycle that will prove so economical and satisfactory in every respect that your customers will recommend it to their friends and make sales for you.

The 1908 MERKEL

is just that kind of a machine. Its Spring Frame and extra long Wheel Base make it extremely easy to ride; its 3 H. P. Motor gives perfect satisfaction, and may be had with Magneto Ignition if desired.

"All roads are smooth on a Merkel, and every ride is a pleasure ride."

When you sell a Merkel, you boost your business.

It will pay you to write for information concerning the construction and record of this little giant motorcycle.

There is a cause for the phenomenal success which is greeting the Merkel at every turn. It is not a matter of chance that the Merkel sales are increasing relatively faster than those of its competitors.

The Merkel makes good—that's the reason

And because the Merkel makes good—stays sold when it is sold—you should investigate it.

But the Merkel does more—it makes new sales. Time and again, we receive orders which are due to no other salesman than the Merkels in every day use.

Remember to write for our illustrated catalogue.

Price, $210.00 With Spring Fork, $225.00

Magneto Ignition, $40.00 additional

You may become our agent if you are located in territory where the Merkel is not already represented.

THE AUTO-BI

A Successful Motor Cycle

Should have plenty of power to climb hills easily.

Should have a practical (tried and tested by the public) method of transmitting pow n engine to rear wheel.

Should have a grip control which will not tire the wrists by hanging on to a loose gri yet be under the instant control of the rider.

Should be equipped with an auxiliary exhaust port to keep motor cool, and add ver and speed, by getting rid of exhaust gases quickly.

Should have motor hung as near the center of machine as possible and very low to ma chine steer easily and so the rider does not have to *straddle a hot motor*. Motor should ced as near horizontal as possible so that explosive force and vibration is exerted on a li n momentum of machine and rider, thus doing away with vibration.

Motor should have solid forged crank shaft *hardened and ground* to *size* (all automobil one piece shafts; why?) inside of motor should be easily accessible without removi tor from frame. Cases split horizontally, as in the Auto-Bi, allow this.

Truss spring cushion forks are indispensable for safety and comfort.

It should be equipped with flusher valve for easy starting at all times.

It should have ample tank capacity for touring purposes.

It should present a graceful pleasing appearance with each part in harmony and bu the particular purpose to which it is put.

A SUCCESSFUL AGENT

Will insist on securing a motorcycle which includes each of the above features. T assure him of a machine which will be easily sold, and will stay sold, and a motorcy ch he can recommend and build up a business with.

A SATISFIED CUSTOMER

The buyer of the 1908 Auto-Bi will get a machine that is guaranteed for the year. It , comfortable, powerful, speedy, can be easily controlled by the novice, and is a stric

AUTOMOBILE TRADE JOURNAL

Vol. XII, No. 10. PHILADELPHIA APRIL 1, 1908

March Edition 20,462

14,456	Copies mailed.
5,226	Copies Delivered to News Company.
1,060	Copies to Philadelphia and foreign, etc. under stamps.
2,964	Copies to the Boston Show.
150	Copies held in reserve.
23,856	
3,394	Back numbers sent out.
20,462	Total copies March edition.
	Of these.
12,782	Were paid subscriptions.
5,226	Delivered to News Company.
18,008	
1,029	Returned by News Company, to March 14, 1908.
16,979	Net total paid.

We print on this page each month an exact statement of the number of copies printed and distributed of the preceding issue of "The Cycle and Automobile Trade Journal."

The bindery count of actual complete copies produced of the March issue was 20,462.

Of these, 21,233 pounds were mailed at pound rates, as shown by post office receipts. Each copy weighs 23½ ounces, representing 14,456 copies, and 3,394 copies of back numbers and copies returned by news companies are accounted for, in addition to the total for the month.

We will be pleased to verify the above figures at any time to any one interested.

Charles J. Glidden, the well-known automobile tourist, and his party from Boston arrived March 13 at Jerusalem. It is said this was the first automobile ever seen in that city and a sensation was created.

Twenty cars have already been entered in the first annual road contest of the Norristown Automobile Club, which will be held on April 28th. The route will be from Norristown to Lancaster, to Reading and to Norristown, and will be covered in one day. Only members of the club will be admitted.

Coming Events

April 4-11—Pittsburg, Pa., Automobile Show, Duquesne Garden, Automobile Dealers' Association of Pittsburg.

April 5-12—Third Annual Automobile Show and Sportsmen's Show, Montreal, Canada, Arena, R. M. Jaffray, manager.

April 6-8—Annual Automobile Show, Mammoth Rink, Denver, Col., G. A. Wahlgreen, manager.

April 6-11—Carnival Opening Week of New York City Automobile Dealers, General Cutting, of New York Automobile Trade Association, chairman of committee in charge.

April 16-18—Automobile Show, Auditorium, Memphis, Tenn. Automobile Dealers' Association of Memphis.

April 24—Stock car road competition for the "Briarcliff" trophy, Westchester County, N. Y., Robert L. Morrell, chairman committee in charge.

April 25-May 25—Industrial Motor Car Competition, A. C. of F., Paris, France.

April 26—Automobile race in Lyons, France (Automobile Club of Rhone).

April 28—Endurance Run, Norristown, Lancaster, Reading, Norristown. Norristown (Pa.) Automobile Club.

May 1-31—Taxicab Competition, Paris, France. Automobile Club of France.

May 4-5—150 Mile Endurance Run, Harrisburg to Philadelphia and return. Motor Club of Harrisburg.

May 6-20—International Automobile Exposition, Moscow, Russia, Automobile Club of Moscow.

May 10—Targa Florio Contest, Sicily, Automobile Club of Italy.

May 15—Algonquin Hill Climb, up Phillips and Perry Hills, Chicago Motor Club, C. P. Root, chairman contest committee.

May 16—200 Mile Endurance Run, Automobile Club of Hartford (Conn.).

May 17-June 2—International Automobile Exposition, Moscow, Russia, Automobile Club of Moscow.

May 30—Hill Climbing Contest at Sport Hill, Easton, Conn., under direction of the Automobile Club of Bridgeport.

June 1-8—Pleasure Car Reliability Trials, Automobile Club of Great Britain, London, England.

June 9-17—Touring Competition for Prince Henry of Prussia, Germany, Imperial Automobile Club of Germany.

June 20-26—McClure Cup Contest in conjunction with annual run of the Albany, N. Y., Automobile Club, John Randerson, chairman of committee in charge.

June 24-27—1200 Mile Reliability Run, Chicago to outlying points and return, Chicago Motor Club, C. P. Root, chairman contest committee.

July 6—Grand Prix Contest for Voiturettes, Lieppe Circuit, France, Automobile Club of France.

July 6-8—National Convention of the A. A. A., at Buffalo, N. Y.

July 7—Grand Prix Contest, Dieppe Circuit, France, A. C. of F.

July 8—Start of Glidden Trophy Tour from Buffalo, N. Y. American Automobile Association, F. B. Hower, Buffalo, N. Y., chairman committee in charge.

July 13-17—International Race Meet, Ostend, Belgium, Automobile Club of Ostend.

September 14—Annual Economy Run, Chicago Motor Club.

July 20-30—Ardennes Circuit Races and Coup de Liederkirke. Automobile Club of Belgium.

August 29-30—Mont Ventoux Hill Climb, France. Vaucluse Automobile Club.

September 1-8—L'Auto's Contest for Voiturettes, Paris. 1909.

January 18-23—Annual Automobile Show in Madison Square Garden, under auspices of Association of Licensed Automobile Manufacturers, 7 E. 42d St., N. Y. City.

February 1-6—Chicago National Automobile Show; National Association Automobile Manufacturers, N. Y. City, S. A. Miles, Manager.

Hosted by Google

World's Record for 300 Miles by Cedrino in a Fiat at Ormond

The star event of the Ormond-Daytona race meet proved to be the 256-mile race for the A. C. A. cup, in which Cedrino in a Fiat, Bernin in a Renault, E. B. Blakely in a 120 H. P. Christie, and R. G. Kelsey in a 60 H. P. Christie participated. In accordance with a previous arrangement, Cedrino, after completing the scheduled 256 miles, continued until he had covered 300 miles, which he did in 3 hours, 53 minutes, 44 seconds, creating a new world's record for the distance. This magnificent run figures out an average of 77.015 miles per hour, or 46.746 seconds per mile, a wonderful average for such a long run. His time for 256 miles was 3 hours, 21 minutes, 27 2-5 seconds, and for 250 miles, 3 hours, 16 minutes, 48 2-5 seconds.

A new record for 100 miles on this beach was made by Maurice Bernin with his Renault, his time for the distance being 1 hour, 12 minutes, 56 1-5 seconds. The previous record was made by Clifford Earp, who covered 100 miles at Ormond in an 80 H. P. Napier in 1906 in 1 hour, 15 minutes, 40 2-5 seconds. Bernin's speed averaged 88.2575 miles per hour. Bernin's new record was made in a match race with S. B. Stevens driving the Fiat Cyclone.

A new amateur one-mile record was established by Bruce Brown, a lad of 17, who played truant from school to attend the races and begged for a trial at the amateur record in the Fiat Cyclone with which Cedrino broke the 300-mile record. Obtaining the permission of Cedrino and the approval of the officials, Brown covered the mile in 35 3-5 seconds, thus supplanting the former amateur record of 39 seconds, made by Wm. K. Vanderbilt, Jr., in 1904 with a 90 H. P. Mercedes.

The Fiat Cyclone, Cedrino driving, also placed the one-mile middleweight record to its credit, covering the mile in 35 seconds flat, 40 3-5 seconds being the former record, made by Vaughn in 1906 with an 80 H. P. Darracq.

Louis J. Bergdoll, driving a 60 H. P. Benz car, won the 150-mile stock car race on the first day of the meet, his time being 2 hours, 40 minutes, 33 seconds. The next day in the invitation race for amateurs he covered 125 miles in 1 hour, 53 minutes, 30 2-5 seconds. These respective times are records for Ormond beach for the distances mentioned.

In the mile trials against time Bergdoll made the distance in 45 3-5 seconds, and R. G. Kelsey (60 H. P. Christie) covered the distance in 42 4-5 seconds, but Bergdoll protested his record on the ground that the Christie was not a stock car. The race officials ruled against Bergdoll, who will appeal to the A. A. A. Racing Board.

July 8 Start of Glidden Tour

The Board of Directors of the A. A. A. have finally decided that the Glidden trophy tour of 1908 will be started from Buffalo on Wednesday, July 8. This will follow a two-day legislative and good roads convention in that city on July 6 and 7, to which all the clubs in the Association are to be invited to conduct runs. The route of the tour has not been finally determined upon, though an itinerary including Cleveland, Pittsburg, Baltimore, Philadelphia, New York and Boston, with termination in the White Mountains, is favored.

The suggestion of permitting manufacturers to bid for the privilege of furnishing the pathfinding car for the A. A. A. touring contest, has been well received on all sides. It is probable that the touring board will invite such bids and that plenty will be forthcoming. The full expenses of the car, including those of the touring board's officials, will be paid by the one supplying the car. Dai Lewis, secretary of the touring board, will chart the route again this year.

Entries for the Glidden tour may be made with Chairman Hower, of the A. A. A. touring board, at any time now, as it is not necessary to name the driver and observer to go with the car until July 3.

The desire of manufacturers to form club teams of one make of car, for the Glidden Tour, the objection to the gamble involved in having to make up time lost through tire troubles, and a daily report on the supply of spare parts carried are among the things being dealt with by Chairman Hower in revising the 1907 A. A. A. touring rules, before submitting them to his associates of the Rules Committee.

New York to Paris Race

On March 16, the Thomas car, representing America, was reported as still ahead and pushing on from Ogden, Utah; while the Italian car, the Zust, had just arrived at Rawlins, Wyoming, 300 miles from Ogden. The De Dion, French car, was laid up three days for repairs and was just leaving Omaha, Neb., while the other French car, the Moto-Bloc, was in the neighborhood of Ames, Iowa. The German car, Protos, was reported stuck in the mud near Nevada, Iowa.

In a note on page 132 L of our March, 1908, issue, under the heading of Trade changes, a mistake was made regarding the purchase of the interest of Frank Wilcox in the Louis E. Rice Mfg. Co. It should have read that Mr. Wilcox's interest has been purchased by Mr. G. R. Dayton, and that the firm is now Rice and Dayton Mfg. Co., of Cedar Falls, Iowa, not Ft. Dodge, as stated.

Grand Prix Entries

One hundred and five automobiles are officially engaged for the Grand Prix races to be held over the Dieppe course, July 6 and 7. Of these, 45 are entered for the Grand Prix and 60 for the small voiturette contest on the preceding day. The 45 champions are distributed among six nations, France having 20, Germany 9, England 6, Italy 6, Belgium 3 and America 1.

S. A. E. Boston Meeting

The first quarterly meeting of the Society of Automobile Engineers was held at Boston during the Show. A visit to the laboratories and factory of the Heinze Electrical Co., in Lowell, was made, the members being conveyed by automobiles from the Bay State Automobile Association headquarters to Lowell, where dinner was served at the Country Club before proceeding to the plant. In the evening a dinner was served at the Bay State Automobile Association and after the business meeting, the following papers were read and discussed: "Perfecting Automobile Ignition," by J. O. Heinze; "Design of Automobile Crankshafts," by P. M. Heldt; "Heavy Goods Transportation Systems," by Joseph A. Anglada; "Automobile Forgings," by Richard W. Funk.

It was decided to hold the next meeting in the latter part of June in Detroit, in conjunction with the American Society of Mechanical Engineers.

Dealers' Associations Unite

The recently organized Association of Automobile Dealers of America has been absorbed by the National Automobile Dealers' Association, which was recently formed during the Chicago show, thus making a strong national association.

E. V. Hartford, president of the Hartford Suspension Co., has made an offer of $200 in cash or in the form of a trophy, to be awarded the driver of the winning car in the Briarcliff race, provided the same is fully equipped with Trauffault-Hartford shock absorbers.

In the March Review, page 49, the description of the roadster was incorrectly used under a cut of the 4-cylinder Earl, the price of which is $1250.00, while the 4-cylinder description was under the cut of the smaller car.

Contesting Cars Should be Technically Examined

In several editorials in our columns we have endeavored to bring out the fact that the only fair method of conducting touring, sealed bonnet or other endurance tests is to have each and every competing car technically examined by a competent committee at the finish, this examination resulting in suitable penalization, to be counted in the final score of the car.

Several comparatively recent competitions have been conducted along these lines and in some instances the rulings have been criticized as too severe. Doubtless, mistakes may have been made in certain cases, but, nevertheless, these competitions were all the more strenuous, owing to this technical examination, and there is no question as to the added glory and value to the winner in a competitive event run under such trying regulations. Certainly when, as has been the case, competitions have resulted in fifteen or twenty ties, each car with a score practically as good as the other, it is time that the conditions governing such contests should be changed to reduce this number to one or two legitimate winners. This is particularly true, as many of the so-called "perfect score" cars were really in very poor condition at the finish and yet were given exactly the same credit as cars which not only finished with perfect scores, but finished in perfect condition. However, it is an extremely difficult matter to so arrange a schedule of penalizations that justice will be done to every type of car in the competition, but it is only by repeatedly holding such contests that a system of penalizations which will be satisfactory, can be devised.

It certainly is not fair to the legitimate winner of a contest to have his car classed with others which, altho they have finished with perfect scores under the restrictions imposed, are yet known, not only to their drivers, but to many others, to be fit subjects for the repair shop or junk pile. These facts can only be brought out by examination, and we consider that penalization for broken parts, loose adjustments and other defects which point to improper construction or material, are just as important as penalization for not complying with the rules on the road.

As the season for renewed activity in track and road competitions is now on, we feel that this matter of suitable examination and penalization of cars at the end of contests, by means of a well-informed technical committee cannot be too strongly urged upon the association and clubs in charge of such contests. We also believe that as the present automobile constructions are showing themselves to be exceptionally reliable and efficient, it is only by such differentiation that actual winners can be determined, and it is due to the purchasing public to make them acquainted with the real facts in regard to the condition of cars at the completion of such contests.

Trend of Motor Car Body Design

The automobile has very rapidly passed thru its successive metamorphoses from a strictly summer vehicle to be used solely for pleasure purposes when weather and road conditions are ideal to that of an all-year-round vehicle, not only for pleasure, but for utilitarian purposes. Of course, the wonderful development of the power equipment has to a great extent made this rapid change possible, but, aside from this, one of the most pertinent factors has been the remarkable development in closed and convertible body design.

Limousine and landaulette bodies are now seen in large numbers, where recently very few were in evidence. These bodies are now arranged that the windows can be easily lowered, converting the car to all intents and purposes into an open body machine, the change requiring but a very few seconds. The landaulette and combination types are rapidly superseding the large cape top cars, particularly in the more expensive models, while the cape top, the cheapness and utility of which so highly recommend it, is more largely used than ever on cars which are not so luxuriously fitted. These bodies make it possible to

Hosted by Google

ride with comfort in almost all kinds of weather, and even in small runabouts there is a growing tendency to use enclosed bodies, the operator being warmly housed within glass walls and the car can be perfectly controlled and the driver still remain in comfort. Some of these bodies are even now being supplied on what might be termed low-priced cars, and are specially offered for the use of physicians, so that at the present time the automobile is looked upon as an all-year-round vehicle, capable of traveling when almost all other means of transportation have been driven from the streets. In fact, in some of our larger cities a remarkable decrease in the number of sleighs has been noticed, due in a large measure to the winter use of enclosed body cars which are more comfortable than sleighs, and even in comparatively deep snow are capable of better speed.

The suburban resident of the larger cities also demands a car of this general type, as by its means the family can be comfortably transported even in cold winter evenings to the city for theatre parties, concerts or lectures, while to ride to the depot in an ordinary carriage, change to a railroad train and repeat the performance again in the city, would now appear to many of these residents as an extremely roundabout and laborious process.

There seems to be a general trend toward the convertible type of body, and some well-known makers are supplying either convertible bodies or a chassis upon which with comparatively little difficulty several different types of bodies can be placed. In the lighter, lower-priced vehicles, particularly those which are supposed to be runabouts, there is what might be termed a retrograde movement toward the folding rear seat, or, more correctly speaking, rear seats, as in nearly all cases accommodations can be supplied to more than one person. These convertible types, however, all show a tendency to keep within weight limitations and are not of the clumsy, massive type which were in evidence formerly. The entire line of bodies are gradually assuming more definite and, in most cases, lighter, more artistic proportions, and it is expected that in the near future it will be possible to purchase cars of moderate price and weight, which can be made to answer either as runabouts or family cars, thus materially increasing the field of usefulness of a single machine.

Lack of Two-Speed and Free Engine Devices on American Motorcycles

To those who are familiar with the development of the motorcycle abroad, the increasing demand for two and three-speed gears cannot but have forced itself upon their attention. For several years it was considered that the light weight of a motor-drive would answer under every and all conditions. However, as these machines came into more general use, and instead of being a plaything became a necessity and were used for business purposes, it became evident that under certain circumstances considerable inconvenience might be caused the rider, owing to the fact that whenever a stop was necessitated the motor must also be stopped, as is so often the case when negotiating streets where the traffic is heavy. Under such circumstances the rider is compelled to get off and push unless his machine is so low that he can place his feet upon the ground. In either case, pedalling has to be resorted to when starting, but the chief difficulty lies in the fact that in climbing a fairly stiff grade when the road surface is muddy or comparatively rough, the direct drive puts too much work upon the motor, which either slows down and stalls or the rider is again compelled to assist by means of the pedals. Hills are often encountered which the motor could easily take provided a reasonable start could be had, but very often teams and pedestrians get in the road at just the wrong time as far as the motor cyclist is concerned, the hill is attempted from practically a standing start with the usual result that again the rider is compelled to assist by means of the pedals. All of this is obviated by the use of a two-speed gear and a free engine.

Owing to these difficulties a gradual demand has been growing for two-speed, and at the present time many are even calling for three-speed gears. This has resulted in the placing upon the market of numerous devices for this purpose, some of the early ones necessitating a dismount and the shifting of a belt, and others, altho not so crude, were found to wear out rapidly or were so heavy as to be considerable of a burden to both machine and engine. Now, however, designers abroad are gradually incorporating in the construction of the motorcycles, two-speed and three-speed hub or pulley devices, which are essentially a part of the machine, and as such give better satisfaction and are much longer lived than the earlier applied speed change mechanisms.

The peculiar part of this entire matter, however, is the fact that in our own country almost no attempt has been made to place upon machines anything but a direct drive. That the eventual motorcycle will not only have a two-speed or three-speed gear, but also a free engine, is not questioned by us. In view of the fact that machines have been in general use for several years longer on the other side than with us, it would seem that the American makers should take time by the forelock and prepare now for now for the inventible demand which must of necessity spring up for these devices in our own, country

Good Going at Savannah

American and foreign cars divided honors at the Savannah race meet, March 18 and 19, an Isotta Fraschini, driven by Louis Strong winning the star event the 342-mile race, and American cars taking honors in the shorter races.

Herbert Lyttle, driving an "Apperson 30" Runabout, drew first blood in the fight for honors on the Savannah course, March 18, winning the 10-lap race for runabouts, the first event of the meet. He covered the 17.1 course ten times, as per schedule, in 3 hours, 35 minutes, 41 seconds. His actual running time was ten minutes less than his elapsed time as he stopped twice, once to replace spark plugs and once to take on fuel When he discovered that one of his spark plugs was missing, he immediately replaced all four instead of wasting time ascertaining which one was not working.

An official survey of the course was made after the first days races showing that the entire distance measures 17.1 to a lap. In the twenty laps called for in the big race the total distance is therefore 342 miles, and for the smaller races, 131 miles.

The scene at the start was one of the gayest Savannah has ever seen. The grandstand, which held 3,000 spectators, was so placed that it commanded a view of 3 miles of the course which was lined with spectators who occupied positions on house and tree tops, on fences etc. The band played "Dixie," and thousands of stunning costumes added brilliance to the scene.

The start of the runabout race was made at 10 A. M., the "Pennsylvania 50" being the first car off. On the second lap it broke an axle, three miles out from Savannah. The third car in this event, a "Thomas-Detroit" had several mishaps which put it out of the running although its driver, J. B. Larrimer, kept gamely at it to the end. Another "Thomas-Detroit" which was entered in this event, blew out a cylinder head on the day before the race in practice and could not participate.

The second event, a 171-mile race for cars of over 575 cubic inches cylinder capacity, started at 2 P. M., but only two cars participated, one a "Thomas Six" driven by George Salzman and the other a "Stearns Six" driven by F. W. Leland. On the second lap a connecting rod in the Stearns' engine broke and part of the rod was driven thru the crank case, so badly damaging the engine that the car had to be withdrawn. The Thomas car finished the 171 miles in 3 hours, 2 minutes, 25 seconds, an average speed of 59.2 miles per hour.

But the big event of the meet, the 342-mile race, was won by the Isotta Fraschini, its time being 6 hours, 21 minutes, 20 seconds. Thirty thousand was the estimated number of persons who witnessed this race, among the spectators being Hon. Hoke Smith Governor of Georgia, who for a time acted as honorary referee. The start was made promptly at 10 A. M., the Apperson driven by Lyttle being the first car sent off. The winning Isotta Fraschini car was second and the others followed in the order named: American (F. I. Tone); Lozier (H. Michener); Apperson (McCulla); Isotta Fraschini (Al Poole); Stearns (F. W. Leland); Acme (M. Newstetter).

During the third lap McCulla's Apperson, which was making good headway, turned completely over in an attempt to pass Poole's Issotta on a turn. The accident wrecked the car but the driver and his assistant landed in a marsh and were not hurt. The "American" car met with several delays and withdrew during the eighth lap. Lyttle's Apperson finished second, time 6 hours, 44 minutes, 37 seconds and the Acme third, time 6 hours, 47 minutes, 5 seconds.

The Savannah people deserve much credit for the thoro manner in which preparations were made. The roads, broad and smooth as asphalt city streets were perfectly oiled. The ten bad turns on the course were adequately banked. The patrols were on the course with red and yellow flags during pracice hours for a week before the race. The grandstand was both the largest and the most advantageously constructed of any similar stand. The score boards were rightly placed. Military patrols were provided and they patrolled. The course was not merely a track as many had supposed from the fact that it was level. The turns were hard and intricate. There was an "S" and a "hair-pin" turn which kept the drivers working. But the notable features of the course were five straightaways on any of which, for greater or shorter distances, unlimited speeding might be indulged in.

Albert L. Pope, who was recently retired as co-receiver for the Pope Motor Car Co., has filed a claim against the company for $787,987.84, which he is said to have advanced to enable the receiver to keep the Toledo plant in operation.

The Hartford Suspension Company, makers of the Truffault-Hartford shock absorbers, have been granted an injunction against the Motor Car Equipment Company, restraining them from manufacturing, selling or using Hercules shock absorbers which the Hartford Company declares is an infringement of its well-known device which carries letters patent, No. 803,589.

We are informed by the J. V. Lindsley & Company that their correct address is not as given on page 128 and 105 of the March Review but is 1139 Monadnock Bldg., Chicago.

A. C. A. Bureau of Tours

The Automobile Club of America's Bureau of Tours has extended its activities very materially and now has included with it in its work the Map Committee and the Sign Post Committee, thereby considerably increasing the facilities offered its members. A new plan has been adopted which places the benefits and services of the bureau at the disposal of any automobilist at a yearly fee of $10. Among the most important benefits derived from subscription are a copy of the Bureau of Tours year-book, containing a list of officially appointed hotels, garages and repair, attorneys, physicians and surgeons thruout the touring regions, route cards and special route information on file covering contemporaneous data on condition of roads, police traps, etc.; assistance and expert advice in planning trips, procuring of licenses, etc., etc.

A. C. A. Leaves A. A. A. Ranks

At a recent meeting of the New York State Automobile Association it was announced that the Automobile Club of America had resigned its membership in the State organization, and therefore renounced its affiliation with the national body, the American Automobile Association. This disruption came about on account of an amended due law, which required all clubs to pay dues on their full membership. This amendment particularly affected the N. Y. Club, which has about 1250 members of all classes—life, active and non-resident or associate—but has been paying but a lump sum of $500 a year in dues.

Colgate Hoyt, President of the Automobile Club of America, disclaimed that the return to the old system of payment had anything to do with the club's withdrawal, and said:

"We simply withdrew because, in the opinion of the Governors, it did not seem to the best interests of the club to remain in the State Association of the A. A. A. We think we can do better work by ourselves. We are not fighting the A. A. A., as our present action was simply one of club policy."

The question of "raising the dues" was not known to the Board when it decided to withdraw, and so had no bearing on the decision.

At the recent Directors' meeting of the A. A. A., at the New York headquarters, the Vermont A. A. and the West Virginia A. A. were elected to membership; also arrangements were made with Victor Breyer, of Paris, France, to become European Consul of the Association for the year 1908. The dates for the Buffalo A. A. A. National Convention were also selected, the same being July 6 and 7.

Mechanical Branch Standardize Rod Ends and Levers

At the meeting of the Mechanical Branch of the Association of Licensed Automobile Manufacturers, on March 10 in New York, standards for 3-8, 5-16, 1-2 and 7-16 rods were adopted and will be known as the A. L. A. M. Standard Adjustable Rod and Yoke Ends. After careful consideration the Branch adopted a uniform modified I section gear shift lever, which the drop forge makers will carry in stock, making these levers interchangeable.

The Committee appointed to report on the standardization of rims felt that the time was not ripe for a universal adoption of the standard rim, owing to the fact that it was impossible to tell whether the clincher or demountable rim would be in vogue.

At the afternoon session, Dr. Charles Edward Lucke of Columbia University, who has been making some very exhaustive tests with alcohol as a fuel for internal combustion engines, delivered an address and E. R. Hewitt who has been experimenting with alcohol for commercial purposes gave some interesting data on the results of his work.

The session closed with the annual election of officers. This resulted in a unanimous reelection of the present encumbents.

1908 A. M. C. M. A. Committees

Committees for 1908 were announced March 18, by Benjamin Briscoe, Chairman of the Committee of Management of the American Motor Car Manufacturers' Association. There are few changes in the committees over last year.

Following are the committees:

Show Committee: H. O. Smith, Premier Motor Mfg. Co., Chairman; S. H. Mora, Mora Motor Car Co.; R. M. Owen, Reo Motor Car Co.

Tours and Races: W. C. Marmon, Nordyke & Marmon Co., Chairman; H. O. Smith, Premier Motor Mfg. Co.; A. C. Newby, National Motor Vehicle Co.

Good Roads: Chas. E. Lewis, Jackson Automobile Co., Chairman; James Couzens, Ford Motor Co.; R. E. Olds, Reo Motor Car Co.; H. B. Krenning, Dorris Motor Car Co.

Legislation: R. E. Olds, Reo Motor Car Co., Chairman; C. G. Stoddard, Dayton Motor Car Co.; A. C. Newby, National Motor Vehicle Co.; R. A. Palmer, Motorcar Co.; R. E. Graham, Acme Motor Car Co.

Membership: W. H. Van Dervoort, Moline Automobile Co., Chairman; Morris Grabowsky, Rapid Motor Vehicle Co.; E. K. Burroughs, Abendroth & Root Mfg. Co.

Advertising and Publicity: Barney F. Everitt, Wayne Automobile Co., Chairman; Harry Fosdick, Moon Motor Car Co.; G. B. Louderback, Buckeye Mfg. Co.; Theo. P. Bailey, St. Louis Car Co.; Leon Myron Bradley, New York Office; Charles E. Duryea, New York Office.

Finance: James Couzens, Ford Motor Co., Chairman; W. G. Morse, Atlas Motor Car Co.; J. B. Bartholomew, The Bartholomew Co.

Standardization and Technical: John D. Maxwell, Maxwell-Briscoe Motor Co., Chairman; Henry Ford, Ford Motor Co.; R. S. Crawford, Crawford Automobile Co.; L. P. Mooers, Moon Motor Car Co.; R. E. Olds, Reo Motor Car Co.

Freight and Transportation: Harry Knox, Atlas Motor Car Co., Chairman; H. W. Mack, Mack Bros. Motor Car Co., R. Harry Croninger, Pennsylvania Auto-Motor Co.; J. N. Willys, Overland Auto Co.; G. D. Wilcox, Gearless Transmission Co.; C. C. Hanch, Nordyke & Marmon Co.

Tires: G. V. Rogers, Mitchell Motor Car Co., Chairman; James Couzens, Ford Motor Co.; Frank Briscoe, Brush Runabout Co.; O. Stevenson, York Motor Car Co.

Agencies: W. H. Van Dervoort, Moline Automobile Co., Chairman; A. R. Welch, Welch Motor Car Co.; H. S. Leyman, De Luxe Motor Car Co.; Frank L. Pierce, Gaeth Automobile Co.; H. B. Larzelere, Chadwick Engineering Works.

BRUSH

Runabout

¶ More people want, and have the money to buy, the Brush Runabout than any other car in America.

¶ A Prediction: Inside of a year, the single cylinder vertical will be as great a craze in this country as it is now in France and Europe.

¶ The Brush is the first of the new style singles. Common sense always wins.

Brush Runabout Co.

Brief Mention of Some New Thi

fices 23 Motor Mart, Park Square, Boston, showed for the first time the new Crown Motor Vehicle, a high-wheel carriage type, with two-cylinder opposed air-cooled motor in the rear of the body and a combination of planetary and dog or lug clutch change speed mechanism, giving two speeds ahead and two reverse.

The Blomstrom Mfg. Co. showed a two-cylinder opposed motor car, with the engine cylinders lengthwise under the hood and fly-wheel horizontal, or in such a position that what gyroscopic effect it produces tends to steady the car when negotiating curves at high speed. The under side of the fly-wheel serves as a friction disc, against which a vertical traversing friction wheel on the propeller shaft acts. The car starts from the seat by means of the lever, also used for the change speeds.

The Boston High-Wheel Auto Mfg. Co., office 179 Clarendon St., Boston, showed a new high-wheel buggy, with a two-cylinder opposed air-cooled motor in the rear of the body and a belt drive over two adjustable sized pulleys to the countershaft, chains driving to the wheels.

Frederick E. Randall Co., 245 Columbus Ave., Boston, exhibited the "Stilson Six," a recent six-cylinder entrant for honors in the automobile field.

A novel innovation was shown in the M. M. Motorcycles of the American Motor Co., Brockton, Mass., in the use of an aluminum piston.

The Percy Fort Co., 226 Columbus Ave., showed a new combination device for caring for tire valve caps and making it possible to quickly clean out the threads or true them up when damaged.

The Ciglia Shock Preventer Co. showed a new shock eliminator of original design, which gives free play to the normal spring action, but prevents excessive motion.

The Ball Bearing Tire Co., 159 Aborn St., Providence, R. I., exhibited a new combination tire, having a crescent-shaped inner tube next the rim and pneumatic rubber balls held by rubber separators placed between the inner tube and outer shoe.

The Pettingill-Andrews Co. showed the new Jacobson Brandow or J. & B. spark coils, made up in separate units and fitted with micrometer adjustment in such a way that either contact point can be removed and replaced without losing the adjustment. J. & B. switches, spark indicators and plugs were also shown.

The Stuart-Howland Co. showed several novelties, as the Treco electric whistle, attachable to any horn; Empire miniature car lamps and a magneto for supplying current for wipe spark ignition.

The Windsor Mfg. Co. showed the Sterling Auto Vice and Spark Plug, the latter being fitted with a vibratory electrode which is self cleaning.

The Massachusetts Automobile Co. showed a new tire filling compound, "Resilicol."

Duncan Robinson, 89 State St., Boston, showed the new Du-Ro shock absorber, which is of entirely new design, using, however, the time-tried principle of the flat spring in its construction.

The Park Square Automobile Station, 18 Columbus Ave., showed the Chandler Non-Skidding Chain, which consists of individual chains passed over the tire and secured to the spokes.

A new electric tail lamp, made by Holt & Beebee, 40 Sudbury St., Boston, was also shown by this company.

H. O. Fletcher, of Hyde Park, Mass., showed for the first time the Fletcher automatic meshing transmission gear, designed to eliminate shocks in gear changing and stripping of the teeth.

John J. Greene, Hope Valley, R. I., showed the Barber motor safety starting device, to prevent injury to an operator when cranking in case of a back kick.

The Ovington Motor Co., 2234 Broadway, N. Y., showed a new low 20 in. frame F. N. four-cylinder motorcycle with large road clearance, and also the Ovico Motorcycle Stand.

The Pittsfield Spark Coil Company, Dalton, Mass., showed the new Acme igniter, which, with a single non-vibrating coil, in combination with distributor, will ignite any number of cylinders. Economy of current is one of its strong features.

E. Flentje, 1643 Cambridge St., showed a new shock absorber of hydraulic type, the fluid used being glycerine. It controls the upward movement only, leaving the springs practically free on the down stroke.

H. F. Campbell showed a separable automarine spark plug and the Duplex spark coils.

The Concord Motor Car Co.'s method of converting ordinary lamps into electric lamps, and also a new electric tail lamp were shown, in connection with the exhibit of Orient cars in the basement.

The F. Kenney Mfg. Co., 360 Dorchester Ave., Boston, showed Kenney's Olivine Non-Alkaline Compound for washing automobiles, a soap of the consistency and transparency of vaseline, its base being olive oil.

The Melrose Automobile Co., Melrose, Mass., exhibited a National Kerosene Burner, adapted for White steamers; a new two cylinder horizontal steam engine for use in steam automobiles, and steam apparatus.

Owing to a very large increase in its business the Autolight & Motor Supply Company, 506-8 North Broad Street, Philadelphia, which carries the largest and most varied stock of automobile accessories and tools in the state, have recently been compelled to erect a large addition to their building.

Trade News Items

In the advertisement of the Star Speedometer by George W. Nock Co., in the March issue, page 291, that company was incorrectly stated as the maker of this instrument instead of its distributor.

Mr. John C. Spiers, formerly factory manager of the Autocar Company, Ardmore, Pa., has been appointed factory manager of the Standard Roller Bearing Company, Philadelphia, Pa., and has full charge of the manufacturing department of that company.

The Chase, air-cooled, 2-cycle, business runabout made by the Chase Truck Co., Syracuse, N. Y., is $750 as correctly stated in the March Review, page 126, under the cut, and not $2,500.00 as incorrectly stated at the end of the paragraph.

The Arlington Co., of 725–727 Broadway, New York City, informs us that it is having an immense call for its Pyralin Transparent Sheeting among the automobile trade. This material is used instead of glass in wind shields, curtain windows, etc., and is made in all thicknesses.

Samuel G. Rigdon, who has been connected with the Goodyear Tire & Rubber Co., of Akron, Ohio, for many years, as general representative, has recently gone with the Republic Rubber Co., of Youngstown, Ohio, to act as general representative of their tire department.

A 2-cycle motor and power outfit for attaching to pedal cycles has been placed on the market by the Motorcycle Equipment & Supply Co., of Hammondsport, N. Y., which is also furnishing a complete motorcycle using this outfit. The outfit will be described and illustrated in an early issue of the Journal.

The Puritan Gas Tank Co., of Boston, Mass., recently purchased the property of the Old Colony Light Co., of Boston. In order to settle the outstanding indebtedness of the old concern, the Puritan concern voluntarily has offered the creditors shares of its six per cent. non-cumulative preferred stock on a basis of 100 cents on the dollar.

William F. Ormsby, Boston, Mass., has published a booklet containing what he calls "universal automobile safety road signals," being a set of horn signals to be used by automobilists in communicating their intention to pass another car, cross street, turn to right or left, ask for more room, etc., etc. Alongside the explanation of the signals appear dashes and dots to illustrate the same.

All arrangements are now about completed for the Duquesne Garden Show at Pittsburg, Pa., April 4-11, under the management of the Automobile Dealers' Association of that city. Much time and money have been expended on decorations and a full line of autos as well as motorcycles and motor boats will be on exhibition.

Since the fire which visited the plant of the Dayton Motor Car Co., Dayton, Ohio, rumors have been constantly circulating to the effect that the concern is badly disabled, etc. This, however, is not the case, the actual facts being that only two departments were damaged, the upholstery and final assembly departments, causing a loss of $100,000, fully covered by insurance. Two days' time were lost in the departments, and about ten days' time lost in shipments. The company will push its business more actively than ever and announces that it is as strong financially and every other way as ever.

It is said that the failure of The New York Car and Truck Co., of Kingston, N. Y., will not affect financially the Allen-Kingston Motor Car Co., of New York, distributor of the cars made by the former company, which also made car trucks. The Allen-Kingston Motor Car Co. is independent of the New York Car and Truck Co., and is not involved in its failure. The automobile plant will probably be bought from the receiver's hands and the manufacture of Allen-Kingston cars continued.

At a recent meeting of the Executive Committee of the N. A. A. M., in New York, the date of the Chicago show was definitely settled as February 6 to 13 inclusive. At a meeting of the A. L. A. M. Executive Committee held on the same day the resignation of Marcus L. Brock as associate manager was received and accepted with regret. In consequence of his resignation there will be some rearrangement in the staff of the licensed body, as a result of which it is understood that H. T. Clinton will look after the agency interests and to some extent the traffic affairs, as well as have charge of the advertising department.

The Equitable Trust Company and Samuel C. Myers have been appointed receivers of the Dragon Motor Company, Thirty-first Street, below Chestnut, Phila., by Judge Holland, in the United States Circuit Court, upon petition of John C. Calhoun, of New York, who has brought suit on a claim of $2400, $2000 of which is represented by note, for money loaned. While the Dragon Company agreed to the receivership, its officials deny its insolvency. The J. G. Brill Company has a claim for five months' rent due from the Dragon Automobile Company, the predecessor of the Dragon Motor Company, which has undertaken to indemnify the Motor Company against the rent claimed, and it is declared that the Brill Company agreed to look to the Dragon Automobile Company for payment.

Fires, Failures, Judgments, Etc.

Receivers Robert H. Carr, Jr., and William S. Bansemer have been appointed for the Auto Supply & Storage Co., 1416 Madison Ave., Baltimore, Md., under a $5000 bond.

American Auto Brass Co., Columbus, Ohio, recently passed into the hands of a receiver.

Fred T. Francis, who has been acting as permanent receiver of the Berkshire Motor Car Co., of Pittsfield, Mass., for some time, has recently been named as permanent receiver.

The American Trust and Savings Bank, trustee for the Biddle-Murray Mfg. Co., of Chicago, bankrupt, has filed its report, which shows $2,675.49 in the treasury.

The Darracq Motor Car Co., 1989 Broadway, New York City, has been petitioned in bankruptcy by its creditors. The liabilities are reported to be $100,000.

The receiver of the Electric Vehicle Co., of Hartford, Conn., has been instructed by the Superior Court of Hartford to pay to George B. Selden, of Rochester, N. Y., and the Association of Licensed Automobile Manufacturers the moneys due to them from time to time; also to appoint a member of the Executive Committee of the Association to deliver sub-license and to institute actions at law under the Selden patent.

The Elyria Machine Parts Co., of Elyria, Ohio, has been placed in the hands of a receiver.

Jordon Auto Co., Minneapolis, Minn., which filed bankruptcy papers last November, has made satisfactory settlement with creditors and will soon resume business.

Hopewell Brothers, of Cambridge, Mass., have brought suit against the Boston branch of the Post & Lester Co., of Hartford, Conn., for selling the Perfect tire case, manufactured by W. H. Wiley & Son, of Hartford, Conn., and which is alleged to be a direct infringement of their patent. The suit against the Allen tire case has been discontinued, a satisfactory settlement having been reached.

The N. N. Hill Brass Co. and the Gong Bell Mfg. Co., both of East Hampton, Conn., were included in the failure of the Hardware and Woodenware Mfg. Co.

The Mercedes Import Co., 590 Fifth avenue, New York, has gone into bankruptcy. John S. Primrose, Henry S. Colwell and Eugene L. Bushe were appointed temporary receivers under a $25,000 bond.

Frederick S. Dickinson, of New York City, is suing the Matheson Motor Car Co., of Wilkes-Barre, Pa., to recover $40,000, which he claims as his share of the capital stock of the company.

The New York Car & Truck Co., of Kingston, N. Y., has filed a petition in bankruptcy. Mr. Robert Wilkinson, of Poughkeepsie, has been appointed receiver under a $40,000 bond.

The Overland Automobile Co., Indianapolis, Ind., is making a 40 per cent. settlement with its creditors, a number of whom have accepted. It is intended to reorganize the company, giving the larger creditors stock in payment of their claims.

Perfection Auto Co., South Bend, Ind. Several creditors have filed a petition in the U. S. Court at Indianapolis, Ind., asking that the Perfection Co. be declared a bankrupt.

At a recent conference of the creditors of the Pope Motor Car Co. and representatives of the receivers it was decided to release Albert L. Pope as receiver and to place George A. Yule, co-receiver, in full charge of the Toledo plant and the affairs of the company in that locality.

The Reliance Motor Car Co., Detroit, Mich., which is in the hands of receiver Victor U. Gurney, will be reorganized. Parties interested are the Reo and Olds Companies, of Lansing, Mich., who, it is claimed, will put $100,000 into the concern.

A petition in bankruptcy has been filed against Leon Rubay, 1697 Broadway, N. Y. Peter Zucker, receiver; bond, $2500.

St. Louis Motor Car Co., Peoria, Ill. A 15 per cent. dividend has been declared. Mr. and Mrs. Jesse French, Sr., withdrew their claim for $61,287.21 against the bankrupt company, on the conditions that a certain touring car in the factory be surrendered to them and that the estate waive all claims for balances alleged to be due for unpaid stock subscriptions.

The Shoemaker Automobile Co., of Elkhart, Ind., filed a petition in involuntary bankruptcy and application for a receiver was granted. T. H. Hollister, of Freeport, Ill., was named as receiver. Liabilities are $50,000; assets, unknown.

Toledo Auto Parts Mfg. Co., Toledo, Ohio.—Frank J. Cheney has made application for a receiver, and asks judgment for $700 alleged to be due him for rent.

Trade Changes

The American Die-Casting Co. recently moved into its new plant, at Garden Lane and White Rivers, Indianapolis, Ind.

American Motor Car Sales Co., wholesale distributors of the American, Marion and Overland automobiles, have removed their main offices from 2230 Broadway, New York City, to Indianapolis, Ind.

The Ampere Mfg. Co., 408 West 13th St., New York City, manufacturers of dry batteries, have applied for a voluntary dissolution of the corporation. Mr. Marcel Levy has been appointed receiver under a $2000 bond; liabilities, $1727, and assets, $1283.

G. W. Cole Co., 42 Broadway, New York City, well-known manufacturers of the 3-in-One oil, has changed its name to the 3-in-One Oil Co.

The Capitol Auto Co., of Lansing, Mich., has purchased the Smith Clawson garage, at 422 Michigan avenue, and is moving the entire equipment and stock to its own garage, at 313 Michigan avenue.

David O. Eaton, 326 North Broad street, Philadelphia, Pa., local agent for the Rapid Delivery Wagon and Trucks, has recently moved to larger quarters at 312 North Sixteenth street.

The Gearless Transmission Co., of Los Angeles, Cal., has moved from the Westlake garage to East Ninth street.

The Gilmore-Edwards Co., of Detroit, Mich., bought out the stock, machinery and good will of the Delray Motor Works, of the same city.

J. C. McFerran, of Louisville, Ky., has given up repair work and opened an office at 721 Paul Jones Building, where he will represent the Pope Motor Car Co., and sell automobile sundries.

Morgan & Wright have discontinued their Cleveland branch, owing to arrangements made with the Ohio Rubber Co., 2048 East Ninth street, for the exclusive sale of M. & W. automobile, vehicle and bicycle tires in Cleveland and vicinity.

Palmer & Singer Mfg. Co., of New York City, agents for the Simplex, Isotia Fraschini and P. & S. cars, recently moved into their new four-story garage at 1620-1624 Broadway.

The Rathbun-Lacy Co., of Toledo, announces that it has disposed of its entire business, including accounts, to the S. M. Jones Co., of the same city, who will continue the manufacture of the Rolaco marine engines.

The Reliance Motor Cycle Co. recently moved from Elmira to Owego, N. Y., where it has taken the Decker Building, on East Main street.

The Supplementary Spiral Spring Co., St. Louis, Mo., has removed its New York office from 52 West Sixty-seventh street to the Motor Mart, 1876 Broadway.

The White Garage Company, Baltimore, Md., recently moved from 1010 Morton street to new quarters at Park avenue and Biddle street.

The Witherbee Igniter Co. moved from 541 West Forty-third street, New York City, to larger quarters on the third floor in the Motor Mart Building, 1876 Broadway.

The Waverly Cycle Co., 200-202 North Tejon street, Colorado Springs, Col., has recently been purchased by C. A. Price and A. H. Lewis from L. H. Skinner, for the sum of $4000.

Wayne Automobile Co., Detroit, Mich.—A managing interest has been purchased by W. E. Flanders and Thomas Walburn, both formerly connected with the Ford Motor Co., and B. F. Everett, who has been connected with the Wayne Company. Mr. Everett is now president and sales manager and Mr. Flanders is general factory manager.

Legislative and Legal

Hearing on the A. A. A. Federal Registration Bill

There was a hearing before the Committee of the Judiciary of the House of Representatives at Washington, D. C., Thursday, March 12th, 1908, on the Federal Registration bill, providing for the registration and numbering of automobiles when engaged in interstate travel. The bill was introduced by Congressman Cocks, of New York, early in the present session of Congress, and the hearing was largely attended. It was opened by President Hotchkiss, who briefly pointed out the necessity for such a bill. The principal argument was made by Charles Thaddeus Terry, Esq., chairman of the Legislative Board of the American Automobile Association and representative of the National Association of Automobile Manufacturers.

It was practically conceded by the committee that legislation of the kind asked for was necessary, but it was apparent at the outset that the problem to be solved was whether Congress could in any way regulate the use of a pleasure vehicle when operated on the highways of a state other than the state of the owner's residence; in other words, when engaged in interstate travel, and many of the members of the committee had grave doubts as to the powers of Congress in the matter. However, after a two hours' presentation by Mr. Terry several members of the committee stated that, while they had been very doubtful, they had been either wholly or almost convinced that Congress had the power. It is not likely that final action will be taken on the bill for some weeks, but it is confidently expected by Mr. Terry and his associates that

Hosted by Google

by such committee, the bill will pass without substantial amendment or opposition.

Automobiles and Carriages

An important decision affecting automobilists of Massachusetts was recently handed down by the Supreme Court. It is in effect that the automobile is not a carriage within the meaning of the statute and towns are not required to keep their highways in condition for automobile travel provided they are maintained in condition reasonably safe and convenient for travel in other vehicles.

Judge Holt, of the United States Circuit Court for the Southern District of New York, decided against the A. L. A. M. in its suit against the De Dietrich Import Company and Walter C. Allen in the matter of selling the Allen-Kingston car. He concludes that on the papers submitted there is sufficient doubt whether the Selden patent is a pioneer patent to deny the motion to punish the defendants for contempt of Court, this motion having been made as Mr. Allen paid no attention to the injunction brought against him by the A. L. A. M.

treated, and any one desiring to obtain infor

The Zimmerman Auto Runabout

The Zimmerman Mfg. Co., of Auburn, Ind., U. S. A., after continued experiments have perfected and placed upon the market a high wheeled motor buggy known as the Zimmerman Auto Runabout. The features claimed for this machine are simplicity, durability and absolute reliability and every machine is sold under a guarantee to be all and do all that the company represents.

GENERAL DESCRIPTION.

The motor is of the two-cylinder, opposed air-cooled type, rated as 10-12 H. P. The change speed mechanism is of the friction drive type, using double discs, a special device gotten out by the makers, which drives both rear wheels separately without the use of a gear differential. The car is said to be capable of speeds from 3 to 25 miles per hour. The accompanying Fig. 1 gives a general idea of the external appearance of the car. The motor is located crosswise under the hood at the front with the flywheel at the forward end. This motor is 4 x 4 and fitted with bronze bearings of extra size and length. Crank shaft and connecting rods are steel forgings and each engine is tested on the block as to whether it properly

tator is of ball bearing roller type

Each of the vheels is provided with a brake drum n internal expanding ring operated by of a foot lever. The wheel base is . and the tread 56 ins. The axles are mediate cross members, which carry the bearings for the shaft drive.

A large muffler which it is claimed is very quiet and without back pressure is located at the rear of the frame in a transverse position, a long pipe connecting it with the left cylinder of the motor, while a branch runs over to the right cylinder. A 6-gallon gasoline tank is provided in the body. These bodies are of auto type, 32 ins. wide, with very roomy seats and a large carrying space in the rear under the boot. The seats are upholstered in leather.

These machines, equipped with a pair of side lamps, horn, tools and oil can, sell for $650 f.o.b. Auburn, Ind. Tops are furnished at $25 extra.

Autocar's Price Has Not Advanced

the March number of this Journal, the of the 30 H. P. Autocar touring car, XIV, was given as $3,750 in the page isement of the Autocar Co. This mistake in figures, which should have 2,750, the price of this popular car for st two years. The price of the Autocar Pa., which informs us that prices of its different types of cars have not been advanced.

AUTOMOBILE SUPPLY

CATALOG

Ready April 10th

The latest and best catalog of automobile sundries and supplies ever issued. Every automobile dealer and owner in the United States should have a copy and use it for making his purchases, as it is the safest buying guide obtainable. It contains illustrations, descriptions and prices of all standard accessories. It is noticeable for the fact that it does not list any unreliable, untried and freakish devices. This handsome book will be sent free upon request.

PHILADELPHIA, PA., U. S. A.

Hosted by Google

have passed very rapidly thru the successive stages from building $750.00 runabouts up through the course of light touring cars, both single and double cylinder, and the medium weight four-cylinder touring car to the construction of large, luxuriously equipt 7-passenger cars. One of the 1906 models was noted for having made one of the longest automobile journeys over a new route from the Pacific to the Atlantic Coast in the hands of W. S. Gehr, and it is stated that it is now running and giving active and satisfactory service.

The Glide line for 1908 consists of three cars: the Model "G" four-cylinder 40 H. P. touring car at $2500.00; the Model "G" Special, four-cylinder, 45 H. P. touring car at $3000.00, and the Model "H," six-cylinder, 60 H. P. touring car at $5000.00.

RANKLIN

The less dead weight a otor-car has, the more al work it can do.

It is because Franklins have no unnecessary weight to lug the power can do what it ought to do—carry passengers climb and go.

Take the 5-passenger Franklin Type D for example. It weighs 2200 pounds. verage 5-passenger automobile weighs fully a third more; and it takes 37 horse- to do the work that Type D does with 28 horse-power. The Franklin six- er, 7-passenger Type H weighs 2600 pounds. Other six-cylinder, 7-passenger nes average about 4000 pounds. Think what a difference this makes in gasoline and tires worn out—to say nothing of comfort.

There's no question of strength. There are no stronger mobiles than Franklins. And Franklins have no plumbing em. All that weight is saved.

The Franklin laminated wood-frame is lighter than the nary steel frame; yet it is stronger; and it makes much er riding.

If there's one most important question about an auto- ile it's the weight question. Before you buy any auto- ile you ought to see it weighed—with your own eyes.

Write for catalogue of Franklin models.

I H FRANKLIN MFG CO Syracuse N Y

Member Association Licensed Automobile Manufacturers

Rutenber, 45 H. P. The clutch is the multiple disc type. The driving shaft has an angularity of but four degrees, and the universal joint is in front, instead of at the rear, of the transmission. The change gear is of the selective type, three speeds forward and one reverse, being attached to the rear axle housing so that the entire construction forms a unit. The rear axle has specially large gears, 2½-inch face, and the differential is hung on large Timken roller bearings, one on either side, the axle shafts being supported at either end near the wheels by two additional Timken roller bearings, making six roller bearings in the rear axle assembly. The rear wheel brakes are double-acting, both internal expanding, metal to metal and external camel's-hair lined contracting. Being mounted as the car is upon ample Timken roller bearings in front and rear axles, the engine is given every advantage to use its power without a large per cent. being lost in friction.

Fig 2. Side elevation of the Model G Special chassis, which shows the pedal and brake arrangements and also the position and mounting of the change speed gear case on the rear axle. The driving shaft housing extends forward and is mounted at the front end in a ball joint which rests on a cross frame member. This ball contains a universal joint which is also arranged to act as a slip joint. The shaft housing and two rods running from the ball to the ends of the rear axle constitute the torsion members and as the brake anchors are mounted on this triangular construction and simply slipped over the rear axle casing but not fastened to it, the re-action of the brakes is taken by these rods and does not tend to rotate the rear axle casing, which, of course, relieves the springs. The thrust is transmitted through this triangular system to the ball on the heavy cross frame member.

The Rutenber motor is one of the oldest produced in this country, and still holds the record of having made the greatest number of miles in 24 hours, namely, 1093¼ miles. This record was made with the motor fitted with a Schebler carburetor, which the company is prepared to furnish with this engine, claiming it to be a combination that cannot well be excelled. This motor is so well known that the details of its construction need not be given, as the new models were described in the January, 1908, isue of the Cycle & Automobile Trade Journal, page 128. The bearings and general construction are so well carried out that it has not been excelled for durability or power. After the severest tests to which it has been subjected, in running continuously on endurance runs, etc., when examined it is claimed to have been found as perfect as when it started.

GLIDE MULTIPLE DISC CLUTCH.

The multiple disc clutch used in the fly-wheel consists of a series of alternate plates or discs about 13 inches in diameter. Six are attached to and carried by the fly-wheel and the alternating five plates are attached to and carried by the clutch shaft. These discs are engaged by the usual spring pressure, and disengaged by a foot lever. Inasmuch as the plates run in oil and become coated with a film when the clutch is released, it is readily seen that when the pressure of the spring forces the plates together, this oil must be forced out between the plates into oil recesses before the plates finally become closely prest together, thus acting as a cushion to relieve the sudden strain upon the motor and preventing the objectionable jerking of the car and strain upon the change speed gears. This clutch is shown in the accompanying drawing. The company state it has performed its work so perfectly that one word of complaint has never been heard about it.

THE UNIVERSAL JOINT.

At the rear end of the clutch shaft, as shown, there is interposed between it and the transmission shaft a universal joint of large proportions. Inasmuch as this joint is ahead of the transmision instead of back of it, as is the case in many automobiles, it does not receive the same heavy strain that is produced in a joint in the usual position when suddenly changing to a lower gear. It is telescoped not only on to the clutch shaft, but on to the transmission shaft sliding on milled key-ways, thus eliminating any loose keys that might cause trouble. By reference to the plan view of Model "G" Special chassis it will be seen that the universal joint is encased in a large ball joint. The housing of this universal joint forms a pocket at the lower side which carries a certain amount of oil into which the universal joint dips and is thus always thoroughly oiled. The ends of the clutch and propeller shafts which receive the universal joint knuckles are provided with three integral keys, the stock between them being milled away. The knuckles of the universal joint are fitted to these ends, a nice sliding fit, forming a coupling of the most flexible and

Hosted by Google

durable type. The rear axle is held in position by means of two very heavy strut-rods which are attached to the brake flange at the rear and to the ball joint at the front. These strut-rods are ample in size to readily stand any amount of strain that is likely to be put upon them in keeping the rear axle in its true position, and the ball joint allows a freedom of motion in a rotating direction so as to relieve the prest steel frame and the rear axle alike from any cramping or any undue stress.

the bolt the caps can be quickly removed. The gears are interchangeable and are fastened to the counter-shaft by means of dowel pins and cap screws, while the reverse and low speed pinions are held by means of Woodruff keys. The gears are straight 6-pitch, which the company considers better than using any form of stub tooth. The shaft carrying the sliding gear member is milled so as to form integral keys and four key-ways, ½ x ¼ inch deep, transmit the load.

Fig. 3. Plan view of 1908 Model G Special. This view gives a general idea of the arrangement of the motor, change gear, etc., in the frame. It also shows the triangular strut rod assembly and the very large brakes on the rear wheel hubs, also the extreme length of the rear springs.

BRAKES.

Particular attention is called to the new and novel features of the brake arrangements. The brakes are anchored in position by means of the strut rods which run forward to the ball universal joint. Consequently the rear axle is relieved from torsional strain which would tend to separate the rear axle from the transmission gear box. These brakes are arranged so that one is independent of the other. The internal, metal to metal service brake is controlled by means of the pedal at the feet of the operator and is not latched. The braking surface is of sufficient size to cause the rear wheels to slide, if occasion should require. The external camel hair lined contracting band brake is operated by a hand lever with ratchet, so that it can be locked in position if it should be desirable to hold the car on a grade. The hub drum on the rear wheel has 3-inch face and is 16 inches in diameter, giving ample braking surface to control the car absolutely with load on any kind of hill.

THE CHANGE SPEED GEAR

The transmission carries the counter-shaft below the main driving shaft, thus allowing it to be completely submerged in oil without the oil flowing into the rear axle and being wasted, as before stated, the transmission is incorporated as a part of the rear axle construction. This counter-shaft is hollow and a bolt is put thru the entire length of the case holding the covering caps in place at the ends and giving the transmission considerable rigidity and also making the parts accessible, as by unscrewing the nuts at the ends of

The gear change is of the selective type, there being two individual rods, these rods being retained in their proper positions by a ball check lock. These rods are interchangeable and are slightly separated so that when one is moved there is no tendency to carry the other along with it. By means of the locking device, when the gears are once placed in mesh in their proper position, this alignment cannot be lost. The entire change gear and rear-axle construction forms a compact unit and special attention is called to the fact

Fig. 4. Change speed gear of Model G Special. This change speed gear case is mounted on the rear axle, the counter shaft or lay shaft being below the main shaft. These shafts are mounted on large Timken roller bearings. The lay shaft is hollow and the bolt is passed thru it from end to end, which holds the front and rear cover plates. On the top of the case, in fact, the entire top of the case forms a large hand hole plate which is held by winged thumb nuts as shown. The gears are 6-pitch of liberal face, give 3 speeds forward and one reverse and are operated selectively. The main shaft is milled, forming integral splines upon which the sliding gear members move. The thrust of the bevel pinion is taken by a ball thrust bearing as shown.

that the stay-rods are attached to the brake anchors, which are slipped on to the rear axle, but are not fastened to it, and that the forward end of these rods is fastened to the ball joint in the centre of the machine and this rests in a socket on a cross bar of the prest steel frame. By means of this construction the torsion of the axle,

Hosted by Google

as well as its thrust, is taken by the strut-rods and delivered at the ball joint, which is well forward of the centre of the car. This construction is probably responsible for the entire absence of broken springs in the 1907 Glide cars.

The rear axle is of the semi-floating type, the axle shafts being 2 in. in diameter, the inner ends being milled with four integral keys so that they are perfectly inserted into corresponding key-ways in the two large differential pinions at the centre of the axle and they are held in position by the roller bearing adjustment nuts and by merely loosening same the rear axle shafts can be withdrawn at will without loosening any other part of the rear axle or its housing.

SUMMARY OF SPECIAL FEATURES.

Attention is called to the following features which are claimed as novel in the Glide Special construction:

The universal ball joint and coupling at the centre of the car, which prevents any undue strain upon any portion of the construction and relieves the gears and shaft in the transmission and rear axle from any backward lash or jam, which might disable the gears. The exceptionally large and perfect working internal and external brakes are so arranged that there is absolutely no torsion on the rear axle or possibility of twisting it out of its anchors when the brakes are operated. The unit construction of the transmission and rear axle mechanism where the greatest work is performed in propelling the car. The unusually large and strong gear teeth in both the transmission and the driving gears. The Rutenber motor used in the Glide Special car is provided with an internal, self-contained oiling device, which keeps the oil at a constant oil level and thus regulates the oiling of the motor to a certainty and prevents over-oiling and sooting spark plugs. The motor is fitted with a double system of ignition, both the battery and the magneto, the Bosch magneto being geared to the timer shaft and the gears encased. The car is finished in automobile red, Brewster green or automobile gray. The price complete, with headlights and extension top, is $3150.00.

Fig. 5. Partial sectional view of Model G Special multiple disc clutch and universal joint. This clutch as shown is entirely encased in the fly wheel and consists of a series of discs 13 inches in diameter. Six discs are attached to the fly wheel and the five alternating discs are carried by the clutch shaft. The clutch is engaged by the usual spring arrangement and disengaged by foot levers. The plates run in an oil bath. The ball shaft housing at the left encloses the universal joint and carries the supply of oil into which the joint dips as it rotates. This housing is rigidly attached to the cross frame member and supports the forward end of the propeller shaft housing and transmits the thrust of the rear wheels to the frame.

According to figures received by the American Motor Car Manufacturers' Association the exports of automobiles during 1907 total 2,894 with a value of $5,120,963 against a total of 1,155 cars and a value of $1,792,308 during 1906. This is a gain of 1,730 cars and $3,328,655 in valuation.

W. O. Foster & Co., Newton, Ia., expect to bring out a light-weight, high-wheel, rig fitted with a double cylinder, air-cooled motor, and friction drive, doing away entirely with differential and transmission gears and not even using any chains or sprockets.

The French Automobile Club is trying an interesting experiment in Paris. It has enlisted and will provide for the expense of maintaining a bicycle auxilliary force, whose chief duty will consist in warning motorists who may be unconsciously infringing municipal regulations. Each bicycle policeman carries three small flags, meaning respectively "smoke," "too fast," and "smell." The squad now devotes its attention to the Champs Elysees, but if the service is found effective, it will be increased to include all principal thoroughfares.

bout. This car was exhibited at the re-
cent Boston show for the first time. The
chassis resembles the type I "40," made
by the same concern, Locomobile Co. of
America, Bridgeport, Conn. In most
particulars, only the springs are lighter,
owing to the use of a much lighter body,
and the seats being lower, give a very
low appearance, altho the Locomobiles
ordinarily have this effect. The steering
column is inclined at a sharper angle than
on the ordinary touring car, and the steer-
ing wheel is increased in size. Other
minor changes have also been effected, al-
tho the power plant with its 40 H. P. motor
remains unchanged.

A strong effort has been made to secure
in this car a combination of style, con-
servatism and comfort, the company be-
lieving the average runabout to be rather
an extreme vehicle, and the seats ordina-
rily far from comfortable, as on many run-
abouts the driver's seat is nearly over
the rear axle.

Hints on Care of Tires

BY WELL-KNOWN MAKERS.

(Continued from page 46, February number.)

LEAKAGE OF THE VALVE

A leakage may be ascertained when the tire is mounted and inflated.

To do so, have the valve cap screwed tightly down, then turn the wheel round so that the valve may be at the highest point of its circumference that is to say, with its cap pointing directly towards the ground; then take a glass filled to the brim with water and place it under the valve raising it so that the valve dips into it. It may sometimes happen that air-bubbles will adhere to the metal; this is not necessarily a leak.

The small spring plug is not supposed to be absolutely air-tight; it is there to act as a valve during pumping and to assure a relative air-tightness until the cap be screwed down. No complaints should be made if it lets one or two air-bubbles escape. If the valve whistles there must be a little dirt or dust in the valve. Clean the plug; if it is worn out or damaged, change it for another, which you should have in your repairing outfit.

If the cap leaks, examine the rubber cap which is inside the head of the metal cap; if it is too damaged or worn which may happen after a certain time, replace it with another which you should have in your repairing outfit. If you have nothing better put in a small washer of leather, soft wood or cloth smeared with tallow solution.

LEAKAGE AT JUNCTION OF VALVE AND TUBE

The hexagonal nut at the base of the valve ought never to be unscrewed not even to take out the tube from the rim; and furthermore it ought always be screwed up tightly. Many inner tubes cease to be air tight solely because the nut has been interfered with.

The following is good advice. Never put oil in the valve All greasy substances have an injurious effect upon rubber; the little plug would soon swell, adhere to the inside and it would no longer be possible to move it. Good valves work perfectly when directions are carefully followed.

CASING INJURIES

It is possible to injure the casing severely without hurting the inner tube and again a slight casing puncture by a nail or similar small article may put the inner tube out of service at once. In most cases, however, where the casing is severely injured, the inner tube suffers also.

TEMPORARY REPAIRS

First, block the wheels of the car with anything handy then jack the axle up so the proper tire will be clear of the ground. If the trouble is a small puncture, only, which has gone through the casing, it can be temporarily fixed up by applying a cloth and leather patch to the inside with solution carried for that purpose. This will keep the inner tube from coming in contact with the rough edges of the canvas.

Many drivers make no effort to fix the tread in case of a small puncture but any cut which penetrated to or through the canvass should be vulcanized as soon as possible to keep moisture from entering and rotting the canvass. A temporary repair in the tread may be made by first opening and cleansing the cut with gasoline on a rag or waste, and then applying a liberal coating of good rubber cement in the cut and on the exposed fabric. The cut should then be held together for a short time until the binding is effected.

For a larger cut the proceeding is much the same, but in addition the tire should then be inflated to 14 lbs. pressure and a leather gaiter firmly laced on it. The gaiter should also be anchored to the spokes to prevent creeping, this will prevent foreign matter from entering the cut. The tire can then be inflated to full pressure and used.

For a blowout the following are the best expedients:—

1. Insert a blowout patch such as are now on the market, inside the casing which will hold the inner tube safely without friction and apply also a rubber protector outside underneath the gaiter or hood and between rim and tread, or

2. Cut a piece of prepared canvas larger than the hole and carefully cement in place inside the casing. After giving it time to dry insert inner tube and pump to about 14 lbs. pressure, then attach the rubber protector and gaiter as previously instructed after which fully inflate the tire.

Much tire trouble can be avoided by having demountable rims and carrying two extra inflated tires in similar rims.

Morgan and Wright Rubber Works also lay stress upon the importance of proper inflation in the following terms:

The proper inflation of tires is a point which cannot be watched too carefully. A tire under-inflated will not stand the wear and tear that a properly inflated tire will. Under service conditions there is a distinct action of the threads upon one another. This is equivalent to one thread sawing another, and it may be largely obviated by proper inflation. Heat is generated by this action or internal friction, analogous to the heat developed by rapidly bending a wire. The heat will destroy the

Hosted by Google

friction coating, then the threads will saw one another apart and a fabric rupture is the result. This adds to the wear and tear at the points of expansion and contraction which extends nearly through the entire circumference of the tire.

Under inflation is the great cause of fabric ruptures. Observe the inflation of you tires not only under usual load but when every seat in your car is filled. When tires are properly inflated they should stand up round under the full load the car is designed to carry. All fabric stretches, whether it be a thread or a hawser, hence after a new set of tires has been run several days they will need additional air. Keep giving them attention until the stretch has disappeared.

SAND BLISTERS

An important point is to have a perfect rim. Rim cutting is altogether too frequent and would seldom be seen were rims perfect and tires properly inflated. Sand blisters and loose treads are caused by small cuts in the cover which allow dirt and moisture to penetrate to the fabric. Unless removed and the cuts cemented this dirt becomes powdered and as the friction stock is softer than the thread stock the dirt follows the line of least resistance and is slowly pushed between these layers causing their separation. Most tire manufacturers use four sizes of lugs, a four inch tire takes a "C" lug, and a four and a half inch tire a "D" lug. It is not infrequent to see them changed about, neither lug can properly seat itself and will surely be a cause of trouble.

To sum up the great causes of tire trouble and dissatisfaction under inflation and lack of attention to the small cuts and punctures allowing moisture and dirt to get in. We cannot impress upon the public too strongly the necessity of keeping their tires well inflated. If all tires were well and properly inflated the cost of tire main enance would be reduced fifty per cent.

The Diamond Rubber Co., Akron, Ohio, in reference to the effect of speed on tires, say:

"We would not undertake to make any definite statement as to the comparative length of the life of tires driven at different speeds, but of course no tire can stand up a great while at 70 miles an hour, and the man who drives at an average of 20 miles an hour or less will get more than twice as much service from his tires as the man who averages from 30 to 50 miles an hour. First, last and all the time, it is the user who gives his tires attention, keeps them well inflated and minor injuries repaired, who gets maximum economy and satisfactory service. We find that the user who habitually gives his car proper attention, keeps it well lubricated and all that, is the man who also looks after his tire equipment, and for this reason gets the best results. But to so great an extent does the element of luck and chance enter into any proposition involving the probable life of a tire, that it is impossible to predict just the extent of mileage any user will obtain." They also add their warning against using improperly inflated tires, the effect of which is constant contraction and expansion of the tread and a constant bending of the walls, neither of which occurs to any considerable extent when the tire is pumped up sufficiently hard so that it will not flatten even under a fully loaded car. Furthermore, a tire run partially flat is constantly bunching up a fold of rubber and fabric, just ahead of the point of contact with the ground and it is safe to say that half the trouble the user is likely to experience, provided he has tires of proper construction and proper sizes, is due to their being allowed to run insufficiently inflated.

USE LARGE TIRES.

The sizes of tires to use under given loads will have much to do with comfort and ultimate economy. It is really wise to use tires of a size larger than usual requirements call for, that they may safely bear an excess load at any time. The difference in initial cost will be repaid many times under average conditions. A point to bear in mind, also, is that for a car carrying four persons tires should be 3½ inch or larger. Too much economy in initial cost of tires, becomes the grossest extravagance—to say nothing of trouble and annoyance, when the tires are put into service.

The question is often asked, if the conditions of service are the same and the size and make of tires the same, why should one automobile owner find his tires badly worn while his neighbor's are still in good condition? What investigation has always shown to be the fact is, that *conditions of service are not and cannot be identical in any two cases.*

One machine will strike a bit of glass that the car just ahead of it missed. The damage is not noticed, but in a short time a sand blister has formed, moisture has penetrated to the fabric of the tire, and its period of usefulness is greatly shortened. Or it happens that the wheels of one car have come to be a very little, or a great deal, out of true. The result is obvious.

One man habitually applies brakes with too much force, takes corners at speed, locks his wheels for sharp curves, or, it may be from sheer ill-luck, encounters a world of trouble that his neighbor, traveling the same road at the same time and at the same average speed, escaped entirely.

CAUSES OF BLOW OUTS.

The Diamond Rubber Company cites three principal causes of blow outs.

"First of these three, and perhaps the most dangerous, as it is the most difficult to discover, is the "stone-bruise." This consists of an internal injury to the casing, due to a violent

Hosted by Google

collision with the street curbing or some other obstruction. One or more plies of fabric in the casing are broken and a weak spot is the result. The strain of service is largely centered in this spot, for the reason that any article will give most at its weakest point. In time a blow-out occurs. It may happen on a perfectly smooth road. The tire user in many cases, considers the accident capable of only one explanation, and that is that the tire was defective.

Unfortunately a stone-bruise does not show itself either inside or outside the tire casing. If there is reason to believe that a casing has been bruised sufficiently to rupture a ply of fabric it is wise to remove the tire and examine it. The weak spot, if one exists, is usually apparent by the unnaturally easy bending of the casing at the damaged spot. The inserting of a new section at this point, a repair which requires the most expert handling, is the only remedy.

A "jab" or deep cut, or it may be a severe puncture, is quite likely to be followed by a blow-out in just such a manner as that which a stone-bruise produces if a repair is not made. In the case of a cut or bad puncture, however, the danger is increased because moisture is admitted to the fabric. A vulcanized repair is the remedy, and as deep cuts and punctures reveal themselves if the tire is carefully examined, it is usually possible to repair the damage and eliminate the danger.

Still another form of blow-out is due to excessive wear of the tire or deterioration of its strength due to long service. Or it is possible that a defect in the casing itself may be responsible. An injury of this kind may be called a "Clean blow-out," and it may be guarded against by having tires retreaded in reasonable season and keeping them in repair generally.

Very rarely if ever is a blow-out due to excessive inflation. On the contrary, it is most often the case that tires are not inflated enough."

ABOUT RIMS.

It is as important that tires should fit the rims properly as it is that they should be well inflated when in use. A rim in which the bead or clincher of the tire is not perfectly seated will cause rim cutting as surely as will the running of a tire flat. Similarly, rims bent or badly indented will cause trouble. Injuries to the rim can often be repaired, but in any event, bear in mind that tires are much the more expensive of the two.

None but inspected rims should be used. They should be kept free of rust. Paint will do this effectively and cheaply. All inspected rims are stamped with the mark herewith shown.

Rough surfaces, projecting screw heads, spoke heads or similar sources of injury in the rims may do great damage to inner tubes, and unless the cause is removed repairs are of little use. It is on account of the likelihood of damage to the tube that we advocate the use of protection strips on one-piece clincher rims.

Wire wheels are especially apt to give trouble and some of the wood wheels on the market are scarcely better. If the screws which hold the rim to the felloes are not properly countersunk trouble is certain.

The best remedy for difficulties of this nature is to make certain that the inner surface of the rims are perfectly smooth and true, and that they are free of dirt and rust, and then apply a protection strip.

TRANSPOSING TIRES.

In ordinary wear it is usually true that tires on the right side become worn more quickly than those on the left. This is due to their being run into ruts and stones, when the car is turned out of the traveled roadway, and because the tires of the right side suffer most from curbings and the like as the driver uses the right side of the street.

Ruts, curbings and similar tire destroyers may wear the outer wall of a casing nearly to the fabric but if the position of the tire is reversed, and that side which has been most exposed and most worn, placed nearest the car, it will still be serviceable.

As the rear tires sustain more than half the burden in every movement of the car they will wear more rapidly than the front tires. For this reason it is not infrequently advisable to change the rear tires to the front and vice versa.

(*To be continued.*)

W. B. Pearson, president of the Standard Screw Co., Chicago, reports he has driven his Winton Six-Teen-Six 1876 miles without a single repair item or delay.

Mr. J. R. Bradford, formerly of the advertising department of the National Cash Register Co., Dayton, Ohio, is now connected with the Inland Auto Company, Walla Walla, Wash., as advertising manager and salesman.

Robert C. Hupp who has been connected with the Ford Motor Co., for a number of years in the purchasing department has resigned to accept a position with the Regal Motor Car Co. as manufacturing manager. He has been associated with the industry for a number of years, and has had a wide practical as well as theoretical experience in all branches of automobile construction.

Hosted by Google

Are you in earnest about wanting to cut down your tire expense? If you are, buy an

If you really want to know what the Elmore saves in tire wear watch a heavily loaded street car vainly endeavoring to start up a slight incline when the tracks are slippery or icy.

If you want to know just what wear and tear on the tires the Elmore does not cause, watch those same wheels to which the power from the motor is applied whirl helplessly around and send forth a shower of sparks while the ponderous car barely moves.

To still further realize what an economical car on tires an Elmore is, watch another car on similar tracks slide along for many feet after the brakes have been applied to the wheels to keep them from rotating.

When you've seen these examples of wear and tear on car wheel tires you've seen wear and tear which is analogous to the wear and tear on the tires of any four cycle automobile. Perhaps not to so marked a degree but analogous, nevertheless.

This wear and tear in a four cycle car is simply unavoidable because the inherent principle of the four cycle car is at fault. It is caused by the uneven and broken application of power.

In any four cycle car first there is a power stroke and then there follows an idle stroke causing a scuffing and jerking on the tires that hastens their annihilation.

The only possible remedy to this condition is the two cycle principle, as exemplified in the Elmore two-cycle valveless car.

In an Elmore such wear is impossible because the power application is continuous, and the wheels rotate at the same speed as the car moves.

Any agent will verify these statements---see one at once. In the meantime write to us for literature.

A BAD CASE OF OVERHEATING.

Kingston, N. Y.

I have a single cylinder motor, 4¾ bore by 6 stroke. When cool the compression is strong and holds well for five minutes. When hot it can be cranked over easily with the relief cock closed. It also gets so hot it pounds and I am obliged to stop and cool it. The water boils. I believe the rings are faulty. Would it be better to put in new rings or attempt to expand or enlarge the old rings? There are four of these rings, which look bright when removed. The upper side of the cylinder is dark and has a color that looks as though it had been overheated, but the direction of rotation is such that the greatest friction would come on the under side and the weight of the parts would also add to this. What is your opinion in regard to this? Is it the rings or some other cause? The engine hasn't the power nor speed it formerly had for it was once very strong for its size. The overheating is what gives most trouble. When running fast with but little load it does much better than when heavily loaded, in which case it quickly heats up. You may answer this thru the Journal and oblige.

C. B. COONS.

I am of the opinion your trouble is with the oil you use on your cylinder walls. When cool the oil is thick and stops the cracks so that it holds compression well, but when hot it is so thin it blows away or possibly it smokes away and leaves the wall dry. If the rings are bright they are all right. Where the cylinder is black would indicate a warpt spot. If this is very large, you may have to rebore the cylinder and fit new piston and rings, but before doing this I would try the virtue of a high-fire test cylinder oil. You can get oils that will have good body when the usual oil has smoked away. Put an oil cup on the top of the cylinder and feed oil to the black spot. If it gets dry here it not only gets hot by friction, but the gases rush out and leave their heat in the walls. Many a poor engine has been blamed for overheating and more radiator been supplied when there was nothing the matter but too low fire test oil. A thin oil is nice for starting on a cold morning, but if you want power and pull at low speeds you must use an oil that will pack the piston when it is hot. And such oil is the most economical for it not only gets more power out of the fuel, but it stays where wanted and does not need to be fed so freely. Better pay three times the price for a good oil than take a poor one. On the other hand, it is possible to use oil so thick that the friction due to pushing the piston thru the thick oil is a big loss and cuts the power way down. I have supplied oil to a motorcycle user and had him say that it added 25 per cent. to the power while the next man found he had lost power. Study your conditions and get what you need. Never mind the other fellow. His ideas or needs may be different. C. E. D.

HOW TO SET VALVES FOR GREATEST H. P.

Kearney, Wyo.

Can you tell me how the valves and cams should be set on a two-cylinder opposed motor to get the most power? ALBERT HINKLE.

If you have been reading this Journal long you have seen your question answered several times. The hardest problem in connection with marketing the automobile has been to educate the public. I fear many makers do not fully appreciate this. It seems to me much better to spend money showing people how simple the motor vehicle really is when stript of all unnecessary features than to spend it showing them how fast it can go. Many a buyer has not yet bought because it is a big mystery to him which he fears because he does not understand it. To overcome this lack of knowledge we are trying to make this department as plain and easy as we can and gladly answer questions over and over again. If your sole object is to get the greatest H. P. from the motor without caring how it behaves at slow speeds, then see that your muffler pipe is long and large and your muffler ample. Open the exhaust valve about 25 degrees of the crank shaft movement before the dead center and leave it open till 10 degrees after. Open the inlet at dead center and keep it open till the next. With this overlapping of the valves you can get some new mixture pulled in by the momentum of the outgoing gases and so will wash out the cylinder before beginning to draw in the new charge. This not only gives a clean new charge of great power, but by getting new mixture in the compression space which is usually left filled with burnt gas you add about 25 per cent. to the available quantity of explosive charge with a corresponding increase in power. For usual service close the exhaust at dead center or close thereto. C. E. D.

(For high speed work some makers also allow the inlet valve to remain open from 5 to 7 degrees of crank shaft rotation after the crank end dead point has been reached.—Ed.)

DISCUSSION OF MATERIALS, STEEL AND ALUMINUM PISTONS.

Chicago, Ill.

Cast iron seems to be the accepted material for cylinders and pistons. It is cheap and wears well. Its strength, however, is low in proportion to its weight and it is rather unreliable unless large sections are used. Its use, therefore, becomes questionable when light weight is sought. Steel cylinders were used on the C. G. V. car for a short time, but were soon replaced with cast iron. The Thor motorcycle engines had steel cylinders in 1906, but since then cast iron has been used. Steel cylinders continue to be used on racing machines. The Panhard racers had them this year as did Christie in his Grand Prix racer. Christie used steel pistons also. Each of them had two rings of phosphor bronze cast on to form the bearing surface. Prest steel pistons have been used on the De Dion engines for some time and were used on several of the French racers last year. None of the latter, I believe, had both cylinders and pistons of steel. Steel on steel is a bad combination unless hardened. Only one engine in which both cylinder and piston were of steel ever came under the writer's notice and it had both cylinder and piston badly scored. The use of steel cylinders seems now to be confined to racers where copious lubrication is always had. The use of steel pistons in cast iron cylinders seems to be growing abroad.

It would be interesting to know how the bronze bearing rings on the pistons of Christie's racer worked. I understand that alloys containing copper have been found unsuitable for packing the piston rods of large double-acting gas engines, as such alloys were attacked by carbonic acid. White metal would not stand the heat.

The Tony Huber-Peugeot motor which won the French two-cycle motor trials was fitted with an aluminum piston. This use of aluminum while novel seems to offer some advantages, especially for two-cycle and air-cooled engines. The heat conductivity of aluminum is 665 (silver 1000), while that of cast iron is 35℃. Thus the temperature of the piston head would be lower and better equalized when aluminum was used than with cast iron. Since aluminum melts at about 1160 degrees F. and loses strength long before this point is reached it is doubtful if very much weight could be saved. Aluminum has a high coefficient of friction (hence its use in friction drives), but this should be of little moment where the surface is lubricated. Since the expansion of aluminum is .00001234 inches per degree F. as compared with .00000556 inches for cast iron a large allowance for difference in expansion would be necessary. As the compressive strength of aluminum is very low, much below its tensile strength, the allowable pressure per square inch of bearing surface would have to be low; which it usually is in pistons as the speed is high. The writer never saw aluminum for a bearing but once and then the pressure was sufficient to enlarge the bearing and soon caused the aluminum to abrade.

Aluminum is used for the cylinder heads (water-cooled) of the Antoinette aeronautical motors in France with good results. Aluminum pistons in steel cylinders would seem to have good features for some conditions. Manganese bronze would seem even better if not attacked by carbonic acid. A thoro discussion of the use of various materials would be beneficial, I believe. W. L. BROCK.

We are glad to get your most interesting letter. If our readers will freely use this department it will be all the more interesting to all and help much toward the perfecting and introduction of this valuable means of transportation, the automobile. Cast iron has several features which commend it for hot work. If you will wipe your fingers across a piece of cast iron that is being machined you will get them dirty. Other metals will not show this effect, so it becomes plain that the iron is different in one peculiar manner at least. This blackening is due to the presence of graphite and it is this which protects the iron from wear and perhaps also from heat. It does not warp out of shape so easily as some other metals and this is of value where durability is to be considered. In engine work, except in special cases, it is strong enuf to stand the service if it is thick enuf to machine easily and truly. On account of this fact nothing is gained by substituting steel or bronze. If the cost of working is not to be considered, then the walls may be made still thinner and the strength of the material and its ability to resist damage from accidental blows become of importance. My own experience with thin steel walls says this was due to the expansion under the sudden application of the intense heat of the explosion with consequent leakage. A mass of metal, however, cannot be changed in temperature so suddenly. I attributed it to intense heating of the walls in spots with consequent burning of the oil and added friction because of this destruction of the oil film.

With a steel piston the case is different. The rings take most of the friction and the piston has simply to hold the rings in place. The piston is subjected to severe mechanical shocks and these are destructive to cast iron, so that metal is not so advantageous in a piston as in a cylinder. I am sure designers could save weight in reciprocating parts by different design. The prest steel pistons are leading in the right direction for they require that the piston pin bearings be attacht instead of cast in place. If the piston is made plain inside so it can be machined, it can be made quite light and the pin bearing can be riveted or bolted in place.

I experimented with aluminum considerably in the early days, having used it for engine heads, water-cooled, and for pistons both of motorcycle engines and for large engines in 1897. I found it often porous so that the pressure forced the gas thru it altho it lookt sound. Further it grew weak under so little heat that I was afraid it would fail if a man forgot his water supply and on such accounts I ceased to use it.

For bearings, aluminum is not good unless the weight is negligible. I understand that in such places as clock frames it wears better than brass. It is my belief that we do not need more expensive materials that we may gain a little power or save a little weight; but that we need simpler devices. Simplification will both save manufacturing cost and maintenance expenses. Simplification will reduce weight and add efficiency faster than anything else. C. E. D.

SPRING PISTON.

PHILA., PA.

I will thank you for your opinion as to what would happen in the make up of the following engine, cylinder as per sketch. Also what kind of card it would be apt to make.

The spring piston will be moved toward the head end and springs comprest at instant of explosion, as the regular piston moves away from its center the spring piston will follow up and keep up the pressure some so as to use it at the point of most leverage, when reached by the crank. In other words I would say that the spring piston would cause the high peak on an indicator diagram, to lower, and to draw it out more, for instance like a late cut off in a steam diagram. SYD VERTS.

Your spring piston idea has been shown by another man in these columns. His letter appeared page 132c, March issue. There is nothing new in it and it is not worth patenting. It will do the work as you describe but the spr ng would be short lived or else very heavy. Why not use gases for a spring? They are frictionless and give back all the power put into them if their heat is not allowed to escape A low compression does just what you are trying to do so far as the card is concerned but it does not scavenge as your device would do Scavenging can be secured by opening an air port at the end of the exhaust stroke and leaving it and the exhaust port both open for an instant. Fresh air will follow the exhaust and wash out the cy inder ready for a new charge which can be a little richer and thus give good power with low compression. I have advocated low pressures for auto work for years and I am pleased to see the idea gaining ground.—C. E. D.

TROUBLE IN STARTING.

Springton, Pa.

I have a 1907 runabout. Got it in September, new, and have trouble in starting. The compression is alright and battery does not seem weak. I went to Easton to see the endurance run and had her standing about two hours and then could hardly get her started, but after she started ran her about 17 miles, did not miss an explosion and worked fine. Can you give me a cause for the trouble in starting? What anti-freezing mixture do you recommend that is not injurious to car and gives complete satisfaction? DAVID H. CRESSMAN.

Starting trouble is usually due to improper mixture. If you get a mixture into an engine that has just been runing well, you can feel pretty sure that it will fire and run again. A strong spark is needed more with a cold engine than with a hot one. Try wetting a kerchief with gasolene and placing it on the air inlet. This will cause the air drawn thru the kerchief to become saturated with vapor of gasolene and so fire easily when it gets to the spark points. With make and break spark it sometimes happens that the break is slow and so makes a weak spark, but this cannot be the case with a vibrator coil. Denatured alcohol and water, half and half, is a good anti-freeze compound C. E. D.

ENGINE WILL NOT SPEED UP.

Columbus, Ohio.

I have a single cylinder 4-cycle engine in my runabout. It does not develop the power that it ought. I am under the impression that the fly-wheel is too large. The cylinder is 6x6 ins., and the fly-wheel is 24 ins. in diameter. Has a four-inch face by two-inch in depth. The compression is good. The spark is strong and the carburetor adjustment O. K. The best that this engine can do is about 320 revolutions per minute. I am under the impression that the engine should do much better. I would be pleased to have your opinion on the matter, and any information would be greatly appreciated. I will be pleased to receive your answer in your most interesting journal of which I am a reader. C. E. HERMAN.

The size of the fly-wheel has nothing to do with your trouble. Evidently the valve timing is wrong or the valves do not lift properly. Or maybe the muffler is clogged so that the gas does not get away at the faster speeds. Take off the muffler and try the engine. Find out when the valves open and how much. Also be sure that the spark is timed right. Such an engine should be able to run up to or above 1000 r. p. m. When you find the trouble write and tell us for the benefit of the next man.

FOUR-CYLINDER OPPOSED MOTOR.

Lindsay, Canada.

We have been working on a two-cylinder, four-cycle opposed engine; 7¼ inch bore, 6¾ inch stroke, running at 650 revolutions per minute, but have difficulty in keeping the connecting rods from getting hot and we cannot get sufficient power out of the engine. We want 28 H. P. continuous work. We govern with throttle on air intake and we are not satisfied with the outfit in any shape. What we are now thinking of building is a four-cylinder opposed, 7¼ inch bore, 8 inch stroke to run at a speed of 450 revolutions per minute, the crankshaft to be made with bearings 7½ inches long on cranks which are opposed; the connecting rods on each opposed engine to work side by side on crank; the cylinders would offset 1½ each; the balance of offset would be made on connecting rods; there would be centre bearing for crank shaft; the cylinders would stand on an angle about 1-6th. Our idea for this is to get the oil more easily to crankshaft bearings. We were also thinking of using a governor on gasoline supply instead of air intake. We would like to have your idea about the opposed cylinder engine working on the angle and also as to best style of governor. We are wanting this engine for combined traction and power and to be as light as possible, say about 1800 pounds weight, to develop 35 to 40 H. P. Any information you can give will be thankfully received.

SYLVESTER MFG. CO., Ltd.

Your present engine looks to be well designed. I would hunt first for trouble in the making up. If you have undue friction anywhere it will cut out the power and so prove to be the cause of your trouble. Examine the pistons carefully to see that they are not rubbing hard somewhere. If they are too tight they not only destroy power, but throw more strain on the connecting rods and perhaps spring them. An offset rod must be stiffer than one not offset. If these are not of the stiffest steel and if they show any signs of uneven pressure, I would either get a new pattern stiffer sidewise or get steel castings from some good steel foundry. Be sure there is ample relief for the head of the piston. A flat head can only expand diametrically and must be one to two-thousandths less per inch of diameter to make up for the difference of temperature in the head and in the water-cooled cylinder walls. Also be sure that the crankshaft is true. If the pins are not parallel to the shaft, the bearings will heat and pound in spite of all you can do. A locomotive building friend told me they always had trouble with crank pin bearings when they bored the pin hole from one side and the axle hole from the other, but since boring both from the same side and with the same setting so as to absolutely insure parallelism their crank troubles ceased. A governor should work on the mixture. It is not easy to get good results even in a slow speed engine by throttling one element of the mixture for this constantly varies the quality.

You ought to be able to oil the crank pin bearing by a sight feed drip oiler on top of the case with a wiper on the connecting rod end. This will take off the oil each turn and be sure to get it where wanted. A little graphite helps smooth up a rough bearing and keeps things cool. If you wish to incline the cylinders, I see no objection to doing so except the explosions will not quite balance. The second will follow the first closer than the third will follow the second. This is of little moment in an engine as heavy as you propose. If you want it as light as possible, it need not be over two-thirds as heavy as you propose and still be ample in every part. If you put two connecting rods on the same pin, put a single bushing under them. This distributes the work over more surface than if you let each work on one-half the space. It will let you make the pin but slightly longer than if for one rod if you choose to make it so short.

For stationary work the pendulum governor is the simplest, but for traction work you must have a ball or centrifugal governor. You will get greater economy from a hit or miss device, but for steady running use throttle governing and put on plenty of large flywheel. C. E. D.

SAFE PISTON SPEED.

Halsey, Pa.

Being a subscriber to the Trade Journal I would like the following questions answered: (1) What is considered a safe piston speed in feet per minute for gas or steam engines? (2) What is meant by a strangle valve? I think it is some form of automatic inlet for gasoline engines. (3) What kind of steel is the best for permanent magnets in a magneto?

J. H. DEVLIN.

Six hundred to 900 feet is considered a safe practical piston speed for a well-built engine getting good care. An auto engine is specially lubricated and is designed to run at its top speed when occasion requires, so there has of late years grown up the practice of rating them at 1000 feet per minute piston speed. I consider this a speed that requires great care if it is to be maintained. A strangle valve would mean a throttle valve or any device where the ingoing air or mixture was strangled or throttled. I would take the meaning from the surrounding text or description. Tungsten steel is said to be best for permanent magnets. Much depends on the temper and the use or abuse of the magnet after put into service.

BLAMING IT ON THE ENGINE.

BRIDGEPORT, CONN.

I thank you very much for your letter in regard to the gearing of my car. Since writing you have found that the car undoubtedly had some trouble beyond the gearing. The car is geared 4 to 1, 4 cylinders, 3½ in. bore, 4 in. stroke, and I put on a new set of cylinders, 4 in. bore same stroke and geared the car 3 to 1, but it did not seem to take it.

I found that the front wheels wh ch had been repaired at a garage, were left in bad shape, so that the housings had cut through nearly ⅞ of the steering knuckles, both top and bottom. Then after taking the wheels off and sending them to the factory, I disconnected the high speed clutch and tried turning the rear wheels by hand, myself on one side and a friend on the other, it was all we could do to turn the wheels. Then after disconnecting the universal joint back of the change speed gear box, I found they would turn perfectly easy, so took the gears directly out of the car and shipped them also to the factory.

Of course I dislike very much to have a new set of gears made, as I have 3 to 1, but if not too much trouble would like to ask you what really is the difference in ratio of bore between a 4 to 1 gear and a 3 to 1 gear. Perhaps, after all, the engine would handle the car with the 3 to 1, with these other things made right.

As I understand, in your judgment a 4-cylinder 4 x 4 ought to be enough to handle a car weighing 2,100 lbs. with a 3 to 1 gear.

I would also like to ask one more question. If the full elliptic springs are put on the rear, would torsion rods running from the rear axle one on each side to the frame be sufficient with the springs pivoted at the top The car now has platform springs, but does not seem to ride easy on the rough roads that I want to go on.

In testing the cylinders, as per your advice, would a testing gage with a set pointer be all right, turning the cold engine over by hand. I really think that there must also be a leak somewhere in the engine, and would like to try it out and see what the compression is. C. H. SHANNON.

Your letter is a particularly valuable one because it shows how prone people are to blame the motor when the car does not go to suit them, whether they know the condition of the rest of the car or not. I hear it on every side. Constantly motors are blamed for overheating when they are doing much more work than they ought to do or than they were ever designed to do. The maker puts in the size and design of motor that in his judgement is ample to make the car do the work reasonably to be expected of it. If the user by over loading as is often done by adding seats, or by neglect of bearings or similar parts increases the oad very materially and is obliged to work the motor unreasonably hard, the maker should not be blamed. Some folks think a motor should work to its limit with out damage but if they will try to do this with their own muscles they will be sore and unfit the next day. Pushing a motor to its limit calls for more lubricating oil with rapid sooting of the walls. It takes more fuel with a low record in this respect. It calls for more cooling capacity and if badly carbonized the normal cooling arrangement may fail and the car or the maker get the blame, never the brilliant genius who presides over the affair and is responsible directly or indirectly for its condition and use or abuse. Every part of the rig should be as free as good bearings and good oil can make it. Then the motor can handle it easily and sweetly. Every few days you should push the vehicle by hand and see if it is running easily. Starting the motor when hot should tell you whether it is as free as at some other time. Also keep track of the compression. Get accustomed to a good compression and try to remember how much effort it takes and if it gets harder or easier look for trouble. Harder may mean a tight bearing or a piston needing oil, while easier may mean that there is a leak. Watch the brake bands. In nearly every car they drag some. Even a little drag cuts down the efficiency a great deal. Be sure every part is as it was designed to be before beginning to change. Consult the makers as to any proposed change. They w ll usually willingly aid you and if they have tried your plan they can tell you why it is wrong and save you money.

An ordinary steam gage is all right for testing compression. Better have the engine hot for several reasons. It has to work hot and you wish to know its condition when it is working. If it is warpt out of shape it will show most when hot. If it leaks so fast that the oil will not stop it when hot, the cold oil being thicker and stiffer, might stop it and you get a false impression. Finally, compressing a charge makes heat. If this goes into cold walls it does not let the gage show the true pressure. The gage hand should fall s owly if the compression is good. If you can not get it up till it is down again, then you have a bad leak.

I do not understand what you mean by "ratio of bore" in reference to gear reductions. Before changing springs, oil up the leaves of the present ones. See that all the bolts in the eyes are free. Test how far they move in actual service. Maybe they are simply too stiff. Take out one of the short leaves. Better submit your new spring arrangement to the makers.—C. E. D.

FRONT WHEEL DRIVING AND REAR WHEEL STEERING.

WORCESTER, MASS.

I am a constant reader of the "Cycle and Automobile Trade Journal" and would like to have you answer, in the columns of that magazine, a few questions.

While I am not a motorist I am very much interested in anything pertaining to motoring. In reading the numerous descriptions of cars written for the Trade Journal by Mr. Hugh Dolnar I have noticed that he quite frequently speaks of cars, in which he has ridden, having the rear wheels try to pass the front wheels. What I would like to know is this. Would'nt this trouble cease if the cars were propelled by the front wheels instead of the rear wheels? It seems to me that this would be a partial if not complete cure for that trouble. I notice that practically all other forms of vehicles are drawn and not pushed and consequently have none of that trouble. If the front drive was used, would it not be all right to steer with the rear wheels? I ask this second question because it seems to me to be a better solution of the steering problem than the use of universal joints, or some combination of gears, to drive the front wheels if they likewise do the steering. I should like to hear from you and also from others connected with the building of cars. I have noticed that there are two or three new motor trucks coming on to the market in which front drive is employed, and this made me think that what was good for a truck was good for a pleasure vehicle, especially in the line of drive location.

Any information which you can give me on the subject will be much appreciated. FRED B. FAY.

It is a poor dog that has no good points. Front drive has some advantages, but most designers believe it has more disadvantages. We have not yet found a simple way to do it without interfering with the front steering; and rear steering is bad. Try leading a bicycle backward if you wish to actually find out how bad. The rear steering wheels must turn into a curb in order to get the car away from it.

They must cross the car tracks to the wrong side to get the front wheels out on the right side and then cross back. This is more distance and more track trouble. Rubber tires do not leave a wet car rail easily so it is often very difficult to get away from a car track without reversing and converting the thing into a front steerer temporarily. Trucks are large high priced rigs and often have to get into close quarters. They do not move rapidly and their wheels have wide tires. They therefore are less affected by tracks than the smaller faster rigs.

There is an easier solution for the skidding problem. It is simple too. Simply put the weight where it belongs, on the drivers, and you can forget skidding. Try it yourself. Carry all you can on your shoulders and you walk without slipping. Try to push or drag all you can and the footing must be of the best or your feet will slip. When the weight is on the front, it is no wonder the rears slip. For ten years I have been driving autos winter and summer almost daily and have never owned a pair of tire chains or other non-slipping device. I have also driven many rigs that lost their heads on every bit of wet asphalt and consider that such a construction not only tends to discourage buyers and users, but is under certain conditions dangerous.—C. E. D.

SELDEN PATENT DATE.

LIMA, N. Y.

Kindly advise me through your Journal the date of issue of the Selden patent and oblige. F. M. BAILEY.

The Selden patent bears date of Nov. 5th 1895. Its filing date was May 8th 1879. It was therefore kept alive in the Patent Office nearly seventeen years or a period nearly equal to the full term for which patents are granted. During this period the modern auto was perfected far enuf to hold successful contests on both sides of the water and so obtained no aid from this patent.—C. E. D.

BLUEING BRASS AND MAKING FIRE EXTINGUISHER.

PINE PLAINS, N. Y.

Will you please answer these questions through your Mechanical and Technical Department?

1. Can you tell me of a preparation for coating metal, to give it the appearance of gun metal?
2. How is fire extinguisher made. H. JACKSON.

WORCESTER, N. Y.

Will you please tell me, in the next edition, the best formula for changing brass, by acids, to a blue or a gun metal finish, and advise me as to whether it will stay so for a long time and work. B. W. HOWE.

If I wanted to coat some metal, I would go to the nearest chandelier works and ask for a sufficient quantity of lacquer. Drug and paint stores may be able to supply it. These lacquers are made in any color and so skilfully colored that it is not easy to see at a glance whether a cheap hatchet is actually blued steel or lacquered cast iron. A handy and fairly serviceable substitute can be easily made by dissolving shellar in alcohol and coloring to suit. A solution of sulphide of potassium will color brass. Have the metal polished before beginning, if a smooth and even job is desired. Wiping it with olive oil and exposure to the weather will also serve, if not in a hurry.

The bottom idea in fire extinguishers is to provide something that when heated gives off a gas that will not support flame and by thus keeping the air away from the flame prevent it from burning.

A solution of sulphate of ammonium and bicarbonate of soda is said to serve well, and if bottled separately will keep indefinitely. Dry bicarbonate of soda (baking soda) and sal ammoniac are generally mixed with fine earth to keep them from becoming lumpy and then kept in a paper or tin cartridge. Almost every formula is different.

Fire losses are mostly preventable and the yearly loss is an enormous drain on the country. Every family should occasionally discuss what to do in case of fire and thus be ready to act if required to do so. The value of a fire pail is increased many times if a dipper accompanies it, for with the dipper the water can be thrown just where wanted. Shut off the drafts if you wish to stop the fire. Fabrics exposed to fire can be made fireproof by wetting with a 10% solution of sulphate or phosphate of ammonia. The effect is permanent until washed out.—C. E. D.

(Another method of blueing brass is the following: Warm the clean unlacquered brass and immerse it in a solution of 1 oz. Antimony Chloride, 3 oz. of pure Hydrochloric Acid and 20 oz. of water. Rinse in clean water and dry in saw dust.—Ed.)

AIR COOLED CARS FOR HOT COUNTRIES.

IMPERIAL, CAL.

I want to take up an agency for a car that will be suitable for the desert. It is very warm here in the Imperial Valley in the summer time, reg. 120 to 125° and the water-cooled cars boil their water very quickly. There are a number of water-cooled cars in the valley but no air-cooled.

I have no trouble with motorcycles over heating, would I with an auto?

Also may I ask, is there a 2-cycle air-cooled auto motor on the market, and if so, is it a success? ELMER E. PECK.

The best way to find out whether you can use air-coolers in your temperature is to try. I believe it can be done. Further I believe the air-cooler will be less trouble there, where water is scarce, than a water-cooled. I would give preference to a light car with a large motor and particularly to a car that had gone thru some of the hard and hot endurance runs successfully as well as given good service in the hands of its users. Get in touch with the makers and see what they have to say. Give preference to a cylinder that is machined all over like many of the motorcycles are, for it is likely that under the increast heat such a cylinder will expand evenly and remain true. 95 degrees is not excessive in this part of the world and you have but thirty more. A slightly less compression and a slightly higher fire test oil will make most any a r-cooler meet your needs in my opinion. If you have any trouble to get a suitable oil perhaps I can help you. I have for years used high test oils.

An increase in temperature of 30 degrees in a water cooled motor is likely to carry it beyond the capacity of its radiator and if its jacket gets full of steam it is no longer evenly cooled and is more likely to warp out of shape. Makers of water-cooled motors do not have to be so careful to get proper iron and proper cylinder design as do the makers of air-cooled engines.

I have been watching the Speedwell air-cooled 2-cycle for over a year and it seems to be doing all right. Made by A. H. Yocum Co., Reading, Pa.—C. E. D.

ANSWER TO CHAS. R. HALL.

GERMANTOWN, PHILA., PA.

Your question in the February Auto. Trade Journal has interested me, as I have successfully used a similar runabout for 5 years.

Have kept it up in good condition and am still getting good results, but know it is underpowered.

I would not advise cutting the cylinder, as the proper position for ports in the bottom, is at a point which would tend to weaken it, and I also believe they would be of very little benefit.

If you are willing to go to some expense, I would suggest replacing the present cylinder head with another one, of such shape as to reduce space and increase compression, containing valves, larger, say 2 in. in diameter, and connect a good carburetor of larger size. You will find you can almost double the power of the engine.

I trust the above may be of some benefit.—G. E. F.

I thank you for your reply to Mr. Hall's query. We desire to make these columns as valuable to our readers as possible and can only do this by using the best information possible. Many heads are better than one and actual experiences with any given machine beat whole pages of theory or even experiences with some different vehicle. I think the suggestion to use larger valves and a larger carburetor is good but I do not believe in the higher compression suggestion. High compression means higher economy but it does not make the engine pull so well nor run so steadily at slow speeds and these features are of more value in an auto engine than economy and high speed. A writer has recently shown by indicator cards that the torque per turn falls off much faster in a high compression engine than it does in a low one and you must admit that this is not what is wanted.—C. E. D.

ADVANTAGES OF OFF-SET CYLINDERS.

AUBURN, IND.

Kindly advise as to the merits of the "Off-set Cylinder" as applied to four and six cylinder vertical motors. In your opinion will it be liable to general adoption? Do you advocate it? And is it American or Foreign practice. Please advise as to best practical publication up-to-date "Automobile Motor" building and designing. HENRY N. MOORE.

If an engine does not reverse, it should be "Off-set." This permits more direct thrust and slightly lengthens the working stroke. The great saving is in lessened friction against one side of the cylinder wal . It is funny how some designers will not consider a horizontal engine because "the weight of the piston wears the cylinder out of round" and yet will continue to use an engine that is not off-set, when the wear from needless side thrust is many times that from the weight of the piston of a horizontal motor. With the off-set shaft the connecting rod angles are slight on the working stroke and great on the idle return stroke. It will in all probability be generally adopted except on reversing engines. So far as I know it was first used on Duryea engines, having been a feature there for ten years.

"Gas Engine Design" by Prof. Chas. E. Luche and 'The Gas Engine" by Hutton are two good books on the subject.—C. E. D.

FRICTION DRIVE INFORMATION.

Toledo, Ohio.

Regarding Mr. A. M. Castle's query in the Mechanical and Technical Department of the "Cycle and Auto Trade Journal," February number, I can supply him some information that may help him out. If he will get the February, 1908 number of the "Machinery," Engineering Edition on page 353, he will find a copy of a paper read before the Society of Mechanical Engineers in December, 1907, that pretty thoroughly covers the ground. The paper was read by Mr. W. F. M. Goss and is entitled "Power Transmission by Friction Drive." Also a chart for determining the horsepower transmitted by the following combinations of materials with the coefficients of friction as deduced from a lengthly series of experiments. I trust this may be of some service.

ARTHUR DUGREY.

BALANCING A SINGLE CYLINDER MOTOR.

Lethbridge, Alberta.

May I ask a portion of your time and space in the Journal for a reply to the following queries: (1) What size and weight of fly-wheel is required for a single cylinder, vertical, 4-cycle motor, mec. operated valves, cylinder bore 4¾x5-inch stroke? (2) What is best practice, to counter balance the crank, piston and connecting rod by counter weights on fly-wheel, or by same attached to crank arms? Please describe best method to obtain a reasonable running balance. (3) What should be the horse-power at say 750 to 1000 revolutions. Thanking you in advance, I beg to sign myself,

STUDENT.

The size and weight of fly-wheel is a matter that may be varied considerably so that it is impossible to say that any particular size is needed for any given engine. If the engine is to run slowly part of the time, the wheel must be large and heavy. If it is not desired to run slowly at any time the wheel may be very light. Make the size as large as convenient and reduce the weight accordingly if for auto work. If for sationary work it may be well made heavy, for weight is of little matter and a heavy and large wheel runs more steadily than a small light one; 20 inches diameter by 150 lbs. weight is about as small and light as I think will meet your needs. Weights on the crank arms are better than on the fly-wheel, but must be heavier for they are closer to the center. You can save a little weight by putting them on the fly-wheel, but being a little to one side they do not truly balance and so the vibration is worse. You cannot fully balance a single cylinder job with such weights however. If the weights balance the piston and rod they are too heavy and are out of balance the other way, i. e., crosswise the engine. If the weights only balance the crank and end of the connecting rod and thus avoid being out of balance crosswise, they do not balance the piston. The common practice is to make them too heavy to balance the crank and rod end, but not heavy enuf to balance the piston also and thus split the difference.

What to do in any particular case depends on the circumstances. If the foundation is solid so the engine cannot jump up and down, it is best to slightly more than balance the crank and rod end for then you will have no cross strains and the foundation will hold it the other way. This also applies if it is a vehicle engine with cylinder lengthwise the body of the car. Consider the conditions and act to fit the case best. The power is estimated by squaring the bore and dividing by 3. This is for 750 ft. piston speed per minute or 900 r. p. m. of your engine and is 7½ H. P. C. E. D.

SHEAR SPRINGS ON AIR-COOLED ENGINES

Bridgeport, Conn.

Writer notes on page 93 in January number "Cycle and Automobile Trade Journal," in reply by you to F. W. regarding air-cooled motors that you state there need be no valve spring trouble, that if the spiral spring softens at its ends, use a shear spring; and that you have used a shear spring in place of Helical with very satisfactory results. I am now using Helical springs and have a good deal of trouble. Would be glad to use the shear spring, but seem to be unable to find out what such a spring is. If not too much trouble, will you kindly give me a drawing? Thanking you in advance, I remain, T. FISH.

The shear spring takes its name from the device used to shear sheep. A similar shear is now sold for trimming the edges of lawns. This form of spring depends for its elasticity on the bend at the bottom of the U and if it has much service to perform or is desired to be of long life it has one or more coils at this point. In some cases its ends are simply turned outward and dropt into shallow holes so the pressure is applied by the extreme point of the wire. This forms a rocking joint free from friction. This form of spring is often used in clippers or in ordinary scissors where a spring is desired to open the blades. For use on an exhaust valve it should have eyes, nearly closed, at each end. The open eye permits getting it around the valve stem without removing the valve or its pin or nut. If the eye is to push against a pin it should be deprest a little so as to take a central position free from friction, as shown in the sketch at A. If it is to bear

on a flat the bend or depression should be in the opposite direction so as to give a rocking bearing as at the upper end. You will plainly see that the elastic portion is far away from the hot stem and that the leverage tending to bend the wire is less as the distance from the bottom of the U is greater. If the wire is stiff enuf to do the work it will not bend at the valve stem till it is very hot. Further, such a spring is much lighter than the usual kind. I have often wondered that designers have not used it to save weight, noise and valve injury. Its easy removal also makes it very desirable. I have used it for 10 years and often seen stems red hot without damage to the spring. C. E. D.

DO THE PUBLIC WANT SAFETY STARTING DEVICES?

Philadelphia, Pa.

I have in mind two schemes to prevent back kicking of starting cranks on gasoline engines, and if either or both are installed on crank it is impossible for the crank to kick back, preventing the operator from getting a broken arm.

Will you kindly inform me if such a thing is of any use to the automobile trade and to what extent. WM. G. KEUCH.

There are many improvements that look like good things which the public do not seem to care for. Later they may get their minds off of other matters and take up these very same things with avidity. The anti-kick starting crank is a thing that costs but little to make and I have for years past supplied a few of them on vehicles turned out by me but there seemed to be no willingness on the part of the public to pay anything for such a safety device so I never even applied for patent. Others have taken out patents and some pretty strong claims exist on devices of this kind. Before spending much money in development I would advise that you get acquainted with these patents thru some patent Attorney and see if you can get a patent to protect your invention. If you have a new device and are willing to spend some money advertising and creating a demand, you may be able to work the public around to a point of view where they may demand anti-kick cranks. They are like sheep in that they follow a leader blindly, if you can get them started. I do not think it can be done and would not advise spending any money on it. Nobody gets excited over a broken arm or a case of tuberculosis; it takes cholera or some uncommon but less important trouble to wake them up. The usual anti-kick arrangement uses a second pawl on the crank to lift out the main pawl if it moves backward. It does the work perfectly.—C. E. D.

FIBRE VS. LEATHER FACING.

Lowell, Mass.

I have a 1905 runabout and have a lot of trouble with the transmission slipping. The expanding shoes are faced with leather. Would it be advisable to face them with fibre. I get this idea from the bands on the transmission of the Oldsmobile runabout, which are faced with fibre and grip to beat the band. Kindly let me hear from you at once.

HENRY L. COTE.

Your clutch shoes need adjusting. Usually the leather facing will hold better than fibre. Leather, however, soaks oil and then may slip. If you will work it full of common chalk you will find that it holds well. Fibre is used for bearings and is very slippery when oily, but it is so hard that it does not soak oil and so does not continue to slip as greasy leather may. It usually takes more effort to set up a fibre clutch than a leather faced one. C. E. D.

WHY GASOLINE TANKS ARE AT THE REAR

Providence, R. I.

Kindly inform me thru the columns of your Journal why the custom seems to be growing among some of our leading makers of placing the gasolene tank under the rear end of the car? The front seat would seem to me a much better location, eliminating to a great extent the chances of breakage, of force feed and a lot of extra piping. C. P. S.

In the big races abroad and on tours, much gasolene is used and under a small seat there is not room for so large a tank. This sent it to the rear. It will stay there till users get tired of the nuisance and extra piping and then it will be moved to a more rational location. At the rear it raises dust and is more exposed to damage than if in the body somewhere. It is easier to fill there, but also easier to tamper with. C. E. D.

(For long distance touring, 20 to 30-gallon tanks are supplied by some makers. These if placed under the front seat are very often so low that when nearly empty and the car on a grade pressure feed is necessary, so these large tanks are usually placed at the rear as they must have pressure feed anyway and there is plenty of room. In this position tanks are not only accessible, but leave free valuable carrying space in the body for touring and also do not necessitate the removal of passengers and cushions when tanks are being filled.—Ed.)

WANTS COMMERCIAL ELECTRIC WIRING DIAGRAMS.

Indianapolis, Ind.

Have been studing all articles on motor cars and motor car parts in your splendid Journal, and would be pleased if you could answer in your columns as to where I might secure diagram of wiring for prevailing electric commercial cars, as I am interested in electric cars and appliances. If you feel as you could, would be thankful if you could give sketch of the above in the next issue of your journal.

JOHN LANE.

You can generally get wiring diagrams from the makers of the car. We do not know to which cars you refer and cannot spare space to give a number of unnecessary diagrams.

C. E. D.

2-Cycle Engines

HUGH DOLNAR

INQUIRY.

C. P. Malcolm.

I have been greatly interested in your articles on the 2-cycle engine, published in the Journal. Kindly give me address of best work on 2-cycle, embodying your ideas. Do you know any firm selling patterns or castings built on lines you advocate?—J. B. GLASGOW.

Mr. Malcolm is no longer living. No such book was ever printed, and no one, so far as known, can supply parts of Mr. Malcolm's motors.—H. D.

WANTS NAMES OF 2-CYCLE ENGINE MAKERS.

Will you kindly give me the names of the makers of 2-cycle gasoline automobile engines, and greatly oblige.—

GEO. W. KEELER.
Care of O. B. North & Co.,
New Haven, Conn.

Will makers of 2-cycle motors please correspond with Mr. Keeler, as above?—H. D.

CAUSE OF 4-CYCLING OF A 2-CYCLE MOTOR.

Cleveland, Ohio.

Why does a 2-cycle motor miss alternate explosions when running light and throttled close? All 2-cycle engines I ever saw do this. Can you tell why?—SHERBONDY.

A throttled charge results in low compression, as the cylinder is not filled to its normal capacity when the exhaust closes, and the low compression causes failure of ignition.* The fly wheel carries the piston down and the partial charge expands but does not exhaust as the pressure in the cylinder is below atmosphere; when the intake port opens a second volume of charge is admitted, thus giving double the charge volume which the cylinder had on the previous compression stroke, thus making compression enough when the up-stroke ends to permit the spark to light the charge and enable the piston to make a working stroke. Then the exhaust occurs and the same performance is repeated, making the motor run 4-cycle until the throttle is given more opening. If the engine has work to do it will run at the same speed without "4-cycling" because the throttle is opened more and the greater charge volume gives greater compression and permits ignition. A variable compression chamber cubic content would avoid "4-cycling," and a pure air charge, never throttled, power of motor varied by a variable quantity of fuel injected at the intake in the pure air charge entering the cylinder, would give constant compression and would avoid "4-cycling" so long as the charge was rich enough to burn. But if the fuel were to be throttled too low with constant compression, and the fuel were injected in such a way that the second fuel charge could enter the intake port though no air was drawn into the cylinder, then the constant compression motor would "4-cycle," same as the throttled motor does when running light on a throttled charge.

This brings in the stratified charge. Manifestly, if the fuel were injected into a compressed pure air charge at a point close to the spark plug there might be a volume of mixture rich enough in fuel lying close about the spark plug points to fire a much smaller quantity of fuel than can be burned when this small quantity of fuel is equally diffused through the entire compression space.

The "4-cycling" of a 2-cycle motor does not waste fuel nor cause muffled explosions except in case of charge expansion by heat from cylinder walls enough to cause part of the charge to enter the muffler. A 2-cycle motor throttled closely and running light may sometimes run 4-cycle with a light muffled explosion between the working stroke explosions, caused in the manner specified by the exhausting of part of a charge too lean to be fired when compressed, as the second charge would yet be increased in richness.

Since 4-cycling does not occur when the motor is working under a load it is not of much importance, but of course the 2-cycle builder wants his motors to work 2-cycle, not 4-cycle.

The pure air charge with fuel injected at the intake port will increase motor flexibility over that of the motor which sucks a carburized charge into the crank box, and the greatest possible 2-cycle motor flexibility would result from a pure air charge and consequent maximum compression, in combination with a mixture compression force pump which would deposit a very little mixture in the compressed charge close around the spark points.

But none of these speculations seem to be

*This statement conflicts with the fact that a charge is more easily ignited when only moderately compressed, than when highly compressed and failure to ignite, causing 4-cycling, is usually explained, as follows: When closely throttled less fresh charge is allowed to enter and more of the burned gas remains. If throttled sufficiently the proportion of fresh charge is so small that the large amount of burned gas dilutes it so that the mixture is too weak to be ignited. Exhaust occurs, some of this mixture goes out and another throttled charge enters. As there is no more burned gas added (due to the failure to explode) this additional charge supplies sufficient fuel to make the mixture ignitable and a working stroke occurs. The cycle is then repeated.—ED.

Hosted by Google

of much practical value, as the 2-cycle motor, pure air charge with fuel admitted to the charge as it enters the intake port, will give constant compression and wide range of power without 4-cycling, and this pure air charge with fuel admitted at the intake seems likely to be much used. No fuel pumps are needed, it is enough to permit liquid fuel to enter the pure air charge as it rushes into the intake port, and the gasoline or kerosene fuel can probably be successfully supplied thru variable needle valves to a multiple cylinder motor, though the writer has never seen this tried. The Secor motor does this successfully with a single cylinder motor, not with a constant compression, however, as the Secor motor throttles the air and the liquid fuel charge both together.—H. D.

CRANK AND PISTON PIN OILING IN 2-CYCLE MOTOR.

BROWNSVILLE, PA.

I would like to have you describe in the Cycle and Automobile Trade Journal, some successful way of lubricating the pitman bearings in the piston and crankshaft wrists, on a 3-cylinder, 2-cycle, 3-port, vertical engine. The splash system now used causes too much oil to reach the cylinders, and I experience too much trouble from carbon in the cylinders. JAS. R. HERBERTSON.

I believe the cheapest and surest way to oil a 2-cycle crank-box pressure motor, is Perry Okey's method of first nearly filling the gasoline tank and then pouring 1-20 or 1-24 gallon of lubricating oil into the gasoline tank for every gallon of gasoline contained in the tank. See Story of Okey Runabout. —H. D.

Opinions and Suggestions

Under the above heading we will be pleased to publish letters from our readers, expressing opinions, stating how they have overcome difficulties, or making useful suggestions. In this department will also be published longer communications or articles, of either a general or technical nature. This department succeeds the "Difficulties Overcome By Users" department, owing to its growth and the varied nature of the matter received.

EXPERIENCES WITH A KEROSENE BURNER.

H. W. HARMON,

Effingham, N. H.

The January number of your journal, contained a little article of mine on the use of kerosene as an automobile fuel. If it demonstrated nothing else, it was certainly conclusive as to the extent of your circulation; for I have been deluged with letters from every part of the country asking for further information, and urging me to write more fully on the subject. Am surprised at the great interest the users of steam cars manifest in the kerosene burner. Now I am not a chemist, and my scientific knowledge of the subject is far from overpowering, yet as I have managed to stay with kerosene burners and obtained very satisfactory results for three seasons, it may be that my experience may have in it something that may prove helpful to the beginner:

The reader may assume that I had long and careful instruction, that I had given the subject deep thought and careful investigation. Unfortunately, this happy condition was not mine. I knew as little of a kerosene burner as an Apache Indian of an airship. There were only two things in my favor, a good car—Stanley—a good burner—National. I give the names not only because it is their due, but for the reason that it answers a multitude of questions from your subscribers, which otherwise I shall have to answer. My faith in kero-burners was from the recommendations of those who had tried them out, and were using them with good results. I was told, however, "You will have trouble for the first two weeks," which proved absolutely true—it was entirely due to myself. I noticed the successful users were men of mechanical turn of mind and reasoned that I could not do as well until I found that it is not skill, but knowledge required for this work, and that the instructions of the makers were really worthy of some attention. The burner was installed in a hurry, and fully exemplified the truth of the old proverb, "The more haste, the less speed," for the maker in a trial spin of a few rods failed to discover that the gauge on the main line was registering falsely, and thereby the fuel line was not getting the required pressure, by 30 pounds. Added to this great handicap, my alcohol lighter by some mischance had been injured beyond use. I had a small gasoline torch, but a weak affair, barely equal to vaporizing gasoline, so my only way to fire up was to use an asbestos wick soaked in kerosene and inserted under the pilot vaporizer. The oil I had was dirty and unfortunately I did not filter it. The wire gauze in the main line had inadvertently been left out, and the one in the fire-tip I did not roll or clean properly. The burner was of the old single part type, no longer made. As if my cup of sorrow was not full to overflowing, these first two weeks, I bought a gold brick in the shape of a large and powerful gasoline torch that was to end all my firing troubles, "It didn't," but it did produce some of the most startling and weird effects. It produced a large flame, but thro the centre of it would be projected a small stream of raw gasoline that made a reservoir of the burner till heated enough to vaporize, and would then start a conflagration that would heat everything in the vicinity, except the vaporizers. My pitying angel finally came in the shape of a professor of chemistry, who was a past master of torches, and we so patched up this one as to be able to fire-up slowly. I now began to look over the instructions of the makers with more care and interest. I strained the oil, filled the pilot-tank two-third full instead of overflowing, put wire gauze in the main line and also learned that it should be cleaned once in a while, and if very bad oil is used twice; kept the gauze in fire-up clean and properly rolled, and made the discovery that the aperture the makers used in the pilot was a trifle better suited for the work than one worked out with a pegging awl. A new torch, an increase of air pressure and I became so convinced that I could now use kerosene successfully that I had the burner changed to one with a double compartment. I also discovered and rectified the false reading of my pressure gauge. My attention at about this time was called to the fact that the makers said, "Clean the pilot with alcohol or gasoline," and I had been using kerosene. This was the finishing touch and I have since had no cause for criticism or complaint. I do not say perfection has been reached, for that is not of this earth, but burners have been made that with intelligent use and ordinary care will successfully burn kerosene for auto fuel.

There are a multitude of little things to which I would like to call the attention of the novice, but the maker's instructions would probably be more intelligible, and perhaps in a way might be said to cover the same ground. In conclusion will say to the beginner, don't change the construction of anything connected with a kerosene burner, no matter whose make, till you have fully considered it, and have good reason to believe the change will be an improvement. Remember the makers have probably gone over the same ground. See that pipe lines are perfectly tight and that the required presssure is constantly maintained. Do not hurry firing. Study it and learn to treat your burner in the way it gives best results on your car. Do not ignore trifles at first, for as in art, they are the sum of perfection. You will find chance to manifest your individuality in your use and care of the burner after you are familiar with it. A man who is as well skilled in this line as perhaps any in the country uses his burner in an entirely different way from mine, yet we are both mighty satisfied with the results obtained, as I trust you will be if you do your part as the maker intended.

ECONOMY AS AN ADVANTAGE OF STEAM CARS.

4 Wells St., Plattsburg, N. Y.

To the arguments in favor of steam given on page 61 of the February number, I would like to add one word. There are many men who do not feel that their income is sufficient to warrant their buying and maintaining a gasolene car, but who could afford to own a steam car, if they would buy judiciously. Last season I ran a small steamer, apparently of the same make as the one referred to in the February letter. I bought it second-hand for a trifle, and after overcoming my first difficulties, inevitable in the case of one who had no experience with machinery, I ran the car during the summer without serious mishap of any kind. The greatest expense was for tires. For other repairs my outlay for the last four months of the season did not amount to $1, all told. The little car, though designed for two people, will accommodate four very comfortably, and has power enough to carry four over ordinary roads faster than I want to ride. At any reasonable speed, it runs as smoothly as one could desire, and it can be controlled perfectly even in the midst of a street crowded with vehicles. To sum up, I would say that for the amount I was willing to spend, I could have found no gasolene car that would do the work required.

CHARLES NORTON.

(We would like the address of the "Strong Steam Advocate" of page 61 of the February number, as he neglected to include same in his letter to the Editor and we have mail for him. —Ed.)

EXPERIENCE WITH FRICTION TRANSMISSION.

Then the next question is to get your power to the hind wheels. The prospects are that the friction transmission will soon be the accepted type, and the writer has always insisted on a double drive, one to each hind wheel. This method is correct design, in that it always gives a balanced pressure on both sides of the disks at all times. The writer tried this design a year ago and also the single traversing wheel. I found that while the single wheel is simpler so far as speeds and reverse are concerned, it necessitates a compensating gear, a long shaft between bearings, which will spring the shaft and gives only half the holding power at any time.

On the double drive I found it hard to support the centre bearings of the friction wheel shafts, but these shafts are short, and if the bearings can be held rigidly the shafts will not spring. I first tried driving the disc shaft by some sort of a jaw clutch from the flywheel shaft, but found that if there was any lost motion, the discs being large, the inertia of the two moving bodies, one driven and the other driving, would shake loose the discs on the shaft. I then took the flywheel off and put in its place an arm equal in length to the diameter of the flywheel, with a ball at each end, and a similar arm on the disc shaft. These were connected by ball-box pitmans about six or seven inches long, which would allow considerable fore and aft motion of the disc shaft and still have no lost motion, and the power was applied far out from the shaft.

This arrangement gave no trouble by jarring loose. but the question of maintaining a given amount of clearance between the discs and paper wheels required solving. I tried a side lever for opposite directions, and on this lever had a pedal with a knee-joint to the forward motion, so I could break contact at any time; shift my speed and lock the joint back to exactly the same position as before. This seemed to work pretty well, but I had no provision for taking up wear of the friction rims and I had to keep moving my lever farther all the time until a limit was reached.

At any rate, this plan removed the flywheel and I can never agree with a maker who puts in a 16-inch flywheeel and then follows it up with a couple of discs 20 to 24 inches diameter, and I fear those that are so constructed will have trouble with the joints between the flywheel and the discs. The removing of the flywheel and making the discs act as such, places the weight farther back, and also saves some weight, which is of great advantage in a light, practical machine, and the reversing disc can be made much smaller and lighter than the forward one.

Another feature that the writer likes about this system of driving, is that practically the whole machine is carried on springs, leaving the axles light and naked. I cannot conceive why some designers will load a hind axle with a lot of casings and compensating gears, and sometimes change gears, weighing as high as 400 or 500 pounds, and yet over every stone that the wheel strikes, on inequally of the ground this mass of iron and wood must be lifted instantly, thus pounding the life out of the tires, when the axle could just as well be made light so it could pump up easily and quickly, letting the springs absorb the shocks. In this case I would also recommend the rotating of the hind axle instead of wheels on spindles, as there is then no wear on spindle and the wheels never get wabbly.

I would like to see more discussion in the Journal as to the relative merits of different constructions and devices, and the reasons for the opinions and hope the publication of this will bring out some new ideas that are not prejudiced by a desire to sell rather than to spread useful information and to perfect the modern means of locomotion.

GRAPHITE FOR AUTO LUBRICATION.

There are many places on an automobile, according to Joseph Dixon Crucible Co., where graphite can be advantageously used.

In discussing the lubrication question of the cars in the New York-Paris race, it was suggested to use graphite owing to its non freezing qualities. It increases cylinder lubrication to mix about a teaspoonful of it to each quart of crank case oil, or a little of the graphited oil may be squirted directly into the cylinder.

For side chains, graphite may be applied dry or mixed with gasoline and oil or with oil alone. If the chains are treated with a mixture of gasoline and graphite mixed to a thick paste and rubbed in well, the chains will run dry, but smoothly and quietly, and dust and dirt will not adhere. Treatment in this manner should be given for every 250 miles, according to conditions of road.

For the leaves of springs, nothing is better than an occasional treatment of a thick paste made of graphite and oil and when introduced under the leaves, it prevents the squeak so commonly heard and so annoying. Where the leaves are tight, then the graphite is often better introduced by means of kerosene, being mixed with kerosene so as to form a thin mixture.

Graphite rubbed on the rims of the wheels will prevent the tire shoes from becoming rusted to the rim.

FOUR WHEEL AND FRICTION DRIVING.

Hagerstown, Md.

The writer has followed the development of the self-driven vehicle ever since your journal was started and has come to some conclusions of his own that will sometimes agree with your editors and sometimes not.

While the auto cannot exactly be compared with the standard traction engine of the day. my experience with both vehicles has been that neither can be a successful self-moving machine until all four wheels are driven.

The necessity for extra loading on the hind axle on the accepted drive is just what buries it in the ground when it fails to keep moving. Equal loads on each axle would obviate this and give the additional pulling power of the front wheels. If we are to drive with one pair of wheels, we would get better results by driving with the front wheels and make them higher instead of lower than the hind wheels. Any engineer knows that you can pull a small wheel over an obstruction easier than push it over; but the writer appreciates the fact that we have a knotty problem on our hands when we undertake to drive and steer at the same time.

CAUSE OF UNEQUAL PERMANENT SET OF FRONT SPRINGS.

That one of the front springs of a car is under greater oad than the other is unquestionably true, as shown by the fact that one spring takes a greater permanent set than the other and this takes place much quicker in one than the other. With motors which are cranked right handed, the right front spring is most affected and with engines cranked in a left handed direction the left front spring is the sufferer.

The cause is not obscure and is due to the reaction on the engine of its own torque. As every action has an equal and opposite reaction there is a strong tendency for the engine case to rotate in an opposite direction from that of the engine shaft. This reaction is of course communicated to the frame and springs with the result above mentioned and is not due to gyroscopic action of the fly-wheel as sometimes suggested except perhaps a slight action in the case of a fly-wheel the axis of which is transversely located and even then the slight gyroscopic action affects either front spring according to the way the car body is tipped.

FINISHING ENGINE BORES WITHOUT GRINDING.

Philadelphia, Pa.

Occasionally it is necessary for lack of tools or one desires to finish a cylinder and piston without grinding. This can be done and a very satisfactory surface obtained, if properly done. Many use fine emery and oil, say 90 or 120 emery, but this is not advisable as particles of the emery are sure to imbed themselves in the metal and cannot be displaced by cleansing with gasoline.

A longer but better method is to use wood ash and plenty of oil, running the engine by belt from a live shaft. Plenty of oil should be used and the process continued for at least 12 hours, and twice this time will be beneficial rather than otherwise. Some makers have such an abhorrence of emery that they will not even use it in the wheel form. However, finishing by grinding is now accepted as standard practice, but it is safe to say that the less loose emery used on the bore the better.

The writer would like to hear thru the Journal the opinion of others on this subject.—S. D. F.

ANSWER TO GALEN HALL.

Portland, Me.

In reply to article in January Trade Journal, under "Difficulties Successfully Overcome by Users," from the Galen Hall Co., Atlantic City, N. J., would say my change speed lever would prevent contacts burning or getting into reverse position accidentally, as its operation is absolutely positive, the position of stops or notches could be easily arranged to correspond to their contact points. I have a full sized working model that was exhibited at the Automobile shows and was subjected to all kinds of abuse, but never failed to operate. I have also equipped cars in Portland, Me., with these levers, that have been in use nine months. Would be pleased to send them model and testimonials.—CHAS. W. BERRY.

HEAT HARDENED CEMENTS TO STOP CRACKS.

ATTLEBORO, MASS.

Would you kindly answer through the Automobile Trade Journal a practical method by which I can stop up a crack in an aluminum crank case?

Crack is a small one and does no harm only when engine is timeing, and then the compression forces the oil out of the crank case. Thanking you in advance for the information, I remain J. C. DANIELS.

(In our February issue 1908, page 62 under the heading "To Repair Cracked Cylinders," a method of filling cracks in cylinder jackets is outlined. Cracks in the crank case can also be treated in a similar manner, with prepared cements which can be obtained from the Smooth-On Mfg. Co., Jersey City, N. J. and Johns-Manville Co., Wil iams St., New York. The methods vary slightly according to the cement used. The cement makers will gladly advise you in any syecial case.—Ed.)

"Very few motorists know that there is a safe way to select automobile cylinder oils other than the slow expensive process of elimination by trial of the various makes, says T. E. Tomlinson, of the Havoline Oil Co., of New York, maker of Havoline Automobile Oils.

"The quickest way to determine the quality of an oil for automobile cylinder use is by the color test. The technical jargon of viscosity, fire test, specific gravity, etc., is unintelligible to most automobilists who know only that what they want is oil as free from impurities as possible, as it is a well known fact that the hot gases in the cylinders burn up the oil, which then deposits a residue of carbon. This carbon deposit is responsible for an endless variety of engine trouble. It is only by a process of filtering that mineral oils can be freed to any extent from the impurities natural to them. The more the oil is filtered the less impurities it contains and consequently the less carbon it will deposit—and the lighter and clearer in color it becomes."

The careful driver knows the sound of his engine and instantly notes any unusual or peculiar noise and investigates. Such care not only means long life to the mechanism, but in some cases has a direct bearing on the length of life of the operator.

It is a common belief that calcium chloride has a very detrimental effect upon galvanized iron pipes and tank, in connection with the circulating system. This is really a fallacy as the action is so very slight if the alkali is pure or reasonably so, that it is really negligable. In several instances tests showed only a slight brightening of the wetted surface as compared to that exposed to the air.

The A. A. A. is calling for a boycott of New Jersey owing to its foolish restrictive measure against automobilists and is calling upon users of motor cars to avoid the State of New Jersey.

The injurious effect of the use of motors on the price of horses has not proved to be what many farmers expected. The average prices of horses in Chicago in 1907, as compared with 1902, shows an increased value, as follows: Draft horse, $28; carriage pairs, $32; driver, $20; general use, each, $20.

The Agricultural Department statistics show an increase in 1907 over 1906 of 297,725 horses and mules in the United States. There are 8,237,449 more harness-using animals in the country now than there were eight years ago.

Mr. J. S. Draper, for three years sales manager of the Wayne Automobile Co., Detroit, has taken up his work as sales manager for the Mora Motor Car Co., Newark, New York.

We are advised by H. H. Franklin Mfg. Co., of Syracuse, N. Y., that in the recent 96-hour non-stop run of a Franklin 28 H. P. runabout at Washington, D. C., the average gasoline consumption was but one gallon for every 24½ miles traveled, and one quart of cylinder oil for every seventy-two miles. On this run, which included 500 miles of road running, it is estimated that the machine would have traveled 2,450 miles at thirty miles an hour.

and the clutch handles well and the c
gear is silent.

THE SHERBONDY DEFLECTOR.

The Sherbondy Brothers tried more
one form of deflector in this motor, and
experiments with a visible charge
pressure, so that the actual course
incoming charge could be observed.

However, no visible charge entranc
give entirely correct information if th
inder is open, because of the lack of
vacuum which follows the opening
exhaust port in the 2-cycle motor,
when working must considerably affe
movement of the entering charge.

The form of deflector adopted fo
motor is shown in Fig. 7, and thoug
the result of many trials and long con
experiments it does not differ mat
from many previous examples in the
of other 2-cycle motor designers. The
bondy's are convinced of the value of de
height, and make this dimension as gr
cylinder head clearance will permit.

1908 Austin Models

6 Cylinder Austin, 90 H. P.

6 Cylinder Austin, 90 H. P.

The 1908 Austin Models are designed to exactly meet my own personal require-ents after 6 years of building high grade cars, and to fulfill the ideas of that class of wners who want the "sportiest" kind of a car it is possible to get with *all* the power d speed they can possibly use—a car that is either a touring car or a runabout capa-e of making a 1000 mile trip any time, and will beat anything on the road.

Our 6 cylinder 90 h. p. model is my idea of such a car—and I believe it stands day without an equal in the Automobile world at any price.

Our new combination body as a touring car has an extra folding footboard hauffeur's seat. The tonneau seat can be replaced in 3 minutes by a rumble seat, us converting the car into a runabout of the very latest design.

The equipment is complete in every respect, and includes both seats, and extension rrey top for the touring car, and single top for the runabout. We also furnish this ew combination body on our regular 60 h. p. model in place of 7 passenger touring ody. This regular standard body, either with or without detachable limousine top, ill be furnished on both 60 and 90 h. p. models.

All Austin cars have the celebrated Austin Motor and are built in our own shops der my personal supervision.

Send for Catalogue and detailed information about our new models.

enger car, the owner of which may wish o drive it himself, with his friends close o him, while the chauffeur, if he be in at-endance, is carried in the rear, the Pack-rd Motor Car Company, of Detroit, Mich., as brought out a special close-coupled ody. This body, attached to the well-nown Packard "Thirty" chassis, is shown n the accompanying illustration.

The Packard "Thirty" runabout is de-igned as a two-passenger car with a rum-le seat for the chauffeur. Every detail f its construction is directly intended to provide comfort for the two people in the egular seats. A runabout chassis is not lesigned for two extra passengers, and lso, two small hard rumble seats cannot

A. A. A. Convention for Buffa

At a meeting of the directors of American Automobile Association, hel the Association's headquarters, No. Fifth Avenue, New York City, Tues March 3rd, the Board resolved to hol open convention of the American mobile Association devoted chiefly to cussion of good roads, legislation and ing at Buffalo on July 6th and 7th, to which city all of the clubs of the ciation will be asked to conduct club t At this convention the good roads ex of the United States, as well as moto interested in legislation, will be invit be present. The Glidden tour will from Buffalo on July 8th. Thus the

The new Packard Close-Coupled Car. This rig is designed to combine the qualities of the runabout wit carrying capacity and easy riding qualities of the touring car. The passengers weight is divided between the and rear springs instead of all the extra weight coming directly on the rear spring as is the case when extra are placed on a runabout. The chassis is the regular Packard "Thirty." The rear end provides storage for bags and touring paraphernalia. Price $4,300.00.

be replaced by two comfortable seats without absolutely ruining the entire design. The company believe that runabout rear springs capable of carrying four people comfortably over rough roads are not possible for a car primarily designed for two people, because the variable load is all on the one set of rear springs and not distributed between the front and rear springs, as in the case of the touring car.

A logical solution of these design problems is the Packard Company's new close-coupled car. In this new design the passengers are midway between the front and rear axles, so their weight is distributed between the front and rear springs. Consequently, a variation of one or two passengers in the load is not immediately felt, and the car can be used with half or full load, with practically equal comfort. It is a peculiarly safe and capable car for fast, hard driving over rough roads, owing to

placed on the market a new line of 4-cycle gasoline motors for automobile and marine use. These new motors are made in two, four and six-cylinder sizes, cylinder sizes ranging from 4 x 4½ in. to 6 x 6 in., but the four-cylinder size only is here shown, tho the descriptive matter is, of course, equally applicable in all essentials

Fig. 1. Left side of the Piggins 4-cylinder motor.

to the other sizes. Piggins Bros. have had an extended experience in automobile and motor building. They built their first car —a steam machine—in 1883, their first electric machine in 1897, and their first gasoline machine in 1902. This gasoline car had a 4 x 4, 4-cycle, 2-cylinder motor and developed a speed of 18 miles per hour carrying four persons. They have been manufacturing gasoline motors for some years and this latest design, here described and illustrated, represents their accumulated experience. It has been their endeavor to turn out a first-class motor both in material and workmanship, which is, besides, neat, compact and accessible. They claim that by putting a little gasoline in the pet-cocks over each cylinder and giving the crank a couple of turns, the engine may then be started on the spark.

A left side view of the 4-cylinder Piggins motor is here shown, this view displaying the valve springs, the valve adjustments, the exhaust manifold and the circulation pump. Vertical and base-end detail views

The BUFFALO CARBURETOR

s as nearly perfect as modern mechanical skill can make it. It s used by the manufacturers of Autos WHO KNOW as regular quipment.

Hosted by Google

BUFFALO CARBURETOR CO.

The Weiwoda Triple-Action Carburetor

The Weiwoda triple-action carburetor is the product of Mathias Weiwoda & Co., 1660-1668 Bushwick Ave., Brooklyn, N. Y., and employs the principle of the old style wick type carburetor. Among the advantages claimed for this carburetor is the fact that it is impossible for it to get out of order, as no valves or spraying devices are used in its construction; also that it will work on a lower grade of gasoline than is now possible. It is also claimed to be economical of fuel.

In this device gas is formed by the passing of hot air thru a series of plates covered with a capillary acting fabric saturated with gasoline. The plates are enclosed in a rectangular metallic box, which is fitted with two openings, one for admitting hot air from a hot air jacket around the exhaust pipe, and the other for discharging the gas to the engine.

Sectional view of the Weiwoda Triple Action Carburetor.

The hot air enters the carburetor at (i), takes its way thru the spray tubes and, on leaving the same, it is carburated by passing upward thru the layer of fuel and also thru the spray of gasoline which it takes up by the velocity given it by the suction stroke of the engine piston.

The gasoline spray is thrown all over the fabric walls so that they are saturated to their utmost capacity when the air is passing between them.

A constant level of gasoline is kept in the tank by means of a small float. The manufacturers state that this carburetor consumes half a pint of gasoline per horsepower per hour. The throttle valve was especially designed for use on this carburetor and is similar to a three-way cock, one opening of which has a check valve for the carburetor, one connects to the intake pipe of the engine, while the third is regulated by an air slide valve. An automatic auxiliary air valve is contained in the throttle valve itself.

The carburetor is made in three sizes, as follows: No. 3, for 3-5 H. P. single cylinder or 8 H. P. multiple cylinder engines, $15.00; No. 5, 6-10 H. P. single cylinder or 15 H. P. multiple cylinder engines, $20.00, and No. 7, 12-20 H. P. single cylinder, or 30 H. P. multiple cylinder engines, $30.00. No. 3 is 11 in. long, 6 in. wide and 7¼ in. high; No. 5, 12 in. x 6 in. x 8¼ in., and No. 7, 15 in. x 6 in. x 8¼ in.

Stark's "Alumaloyd Sheets

The Stark Alumaloyd Rolling Mill Co., Canton, Ohio, is furnishing to the automobile trade "Alumaloyd" sheets designed especially for bodies, dashes, guards, bonnets, battery boxes, drip pans, mufflers, etc., and recommended for their durability and their non-rusting quality. These sheets are made from a metal of special composition coated with an aluminum alloyed metal by a method said to result in the absorption of the aluminum alloy, not a surface coating.

These "Alumaloyd" sheets can be stampt, drawn, prest, double seamed or soldered, and one of the chief claims of superiority made by the manufacturer is that as they will not rust, the matter of finishing a body or other part made from them is not only greatly simplified but is a much cheaper process than is usual. The maker of these sheets claims that an "Alumaloyd" body can be finished by the application of a primer, one color-coat, a rubbing and a finishing varnish, the original surface of the sheets being equal to a pumice-stoned surface, so that the sandpapering, rough stuff filling, putty-filling, pumice stoning and the application of several color and rub coats are all eliminated.

For guards and bonnets the saving is similar to that effected in bodies, on account of the absence of rust around rivets, stays and stiffeners.

These sheets are packed in cases of 175 lbs. each and can be furnished in all standard sizes and gages.

Charles F. Sweet, of Hartford, Conn., manufactures a complete line of automobile lubricants, soap, metal, polish, etc., all of which are distributed by Empire Distributing Co., 200-204 West 71st street, New York City, to whom all inquiries should be addrest. The "Sweet" line includes the "Mercedes" automobile oils, light, medium, heavy and special, for all cars, put up in 1, 5 and 10-gallon cans, barrels and half barrels; Non-Fluid greases for transmission lubrication, etc., in four consistencies, supplied in 2, 5 and 10-pound pails; Climax cup grease, for lubrication of bearings, gears, etc., in four consistencies, in 2, 5 and 10-pound pails; oil soap, guaranteed free from alkali or any ingredient that would injure the surface of automobiles, in 5, 25 and 50-pound pails, barrels and half barrels; Magic metal polish, put up in pints, quarts and gallons, with white, black and red polishing powders.

The purpose of this attachment is to provide quick and easy means for automatically chamfering or rounding the teeth of sliding gears for automobile change speed gears and for similar purposes in connection with machine tools, etc. The device is manufactured by the Long Arm System Co., of Cleveland, Ohio.

The attachment may be secured to the table of a small milling machine, and when once set up with the initial adjustments of the cutter and work made, it is not necessary to stop the machine or do any other work than to take off and put on duplicate gears. It will chamfer gears of from 2-inch to 9½-inch pitch diameter and of 4 to 10 diametral pitch. When run at the proper speeds, about 12 teeth per minute may be chamfered or rounded. The contour of the chamfering may be changed by using special cams, or special cutters, or both. The frame is of cast iron, of strong cross section, and to it all the details of the complete attachment are secured. Two slots are provided for the bolts clamping the attachment to the milling machine table. The bracket is securely fastened to the side of the frame and the principal driving mechanism is held in it. This consists of the main driving shaft, with pulley and pinion attached; the cam spindle, with cam and cam gear attached, and engaging with the driving pinion; and the rocker arm carrying the intermediate gear connecting the cam gear with the worm driving gear. The cutter usually furnished with the attachment are double end cutters, the body of the cutter

The "Long-Arm" Automatic Tooth Chamfering attachment.

plete with counter shaft, clamping one worm, one cam, two double end cu and bushings for locating and holding size gear.

The Herz Tandem Pump

To meet the requirements of those desire a power operated tire pump permanently attached to the motor, & Co., 203 Lafayette St., New York have lately placed on the market a type of power operated pump, which call the "Tandem." This is a very s device, takes up little room, and seem meet the requirements of the case ex As will be seen from the illustration with, it consists of a small pump w very simple operating mechanism, co ing of three discs arranged in tanden of which is to be held against the fly- of the motor by the user. The han detachable, as shown in the illustrati that the pump can be stowed away in small space when not in use. The is of cast aluminum with bearings of phor bronze, and the friction wheel of aluminum covered with pure gum. connecting rod is of bronze and the h is of enameled wood. The total l with the handle is 24 inches and the width is 5 inches. The price is $20 extra heavy rubber hose is furnished at 35 cents per foot, and a mano is attached at an extra cost of $3.50. also furnish an air-tight pump conn at 45 cents extra.

ity, manufacturer and inventor of the ones Speedometer, has recently brought ut a Taximeter, which is mechanically mple and shows a high quality of workanship, general appearance and finish.

The instrument is about 7 in. in diameter y 4 in. in thickness. It has a silver dial ce in front with figures indicating the te or tariff, the total fare to be paid by e passenger, and a separate indication r the extras. The reverse side of the inrument has a dial giving a total of all oneys received by the driver, the total ileage made by the cab and the trip milege, which can be reset by the driver if desired. Also a separate count of the umber of trips with single and with doule tariff. A vacant sign is also displayed n the reverse side of the instrument hich, when a passenger enters the vehile, is thrown to the right by the driver

The Jones Taximeter, front view.

ntil it assumes a horizontal position, inicating on the dial tariff (1) and at the ame time ringing up an initial charge of 0 cents for the first half mile. After the irst half mile has been traversed an addiional charge of 10 cents for each quarter nile is added to the total. In the event of here being a trunk or other baggage for which there is an extra charge, the driver urns a knob on the reverse side of the nstrument which causes the extra charge o be indicated under the heading "Extras" on the dial, and also adds the amount of he extra charge under the head "Total

position when the same initial charg made, which after a third of a mile been traversed an additional charge o cents for each one-sixth of a mile. Taximeter, in addition to containing counting mechanism actuated by the n age, also contains a clock mechan which, when the "Vacant" sign is down the vehicle is standing, causes a charg 10 cents to be registerd for each six n utes of waiting, and a like amount is ad to the total. This, of course, is all ranged automatically so that the dr has no control over the instrument ex to start it and stop it.

Back view of the Jones Taximeter.

One of the most important improvem is the "Totalizing" feature, which gives entire amount due from the passenge a single total without the necessit adding the tariffs and the extras. **the entire amount of money due the company, such as initial charges, tional charges and extras, are given** single total. The Taximeters are now ing manufactured, and will be lease operators of motor taxicabs, horse etc., and the Jones Company attaches pairs, maintains and guarantees the struments. The company believes that is the only satisfactory method on w to operate the instruments.

THE SELDEN CAR

Model

Five Passenger Touring Car, $2000
Three Passenger Runabout, $2000

AN ATTRACTIVE CAR
AT AN ATTRACTIVE PRICE

SPECIFICATIONS

ngine—4 cylinders $4\frac{1}{4} \times 4\frac{1}{2}$, 28-30 brake horse-power.

ransmission—3 speeds forward and reverse, selective, Timken bearings.

heel base—109 inches; tread, standard; clutch, cone leather.

ody—sheet metal, straight line type, roomy and comfortable.

Tires—$32 \times 3\frac{1}{2}$, quick detachable; make optional.

Frame—pressed steel, $4\frac{3}{4}$ inches deep.

Front axle—single I-beam drop forging, ball bearings.

Rear axle—Bevel gear drive, enclosed type, roller bearings.

Ignition—synchronized jump spark.

Weight—empty, 2,200 lbs. (actual, not catalog.)

REPRESENTED IN GREATER NEW YORK BY
The Palmer & Singer Manufacturing Company, 1620 Broadway

SELDEN MOTOR VEHICLE CO.

ROCHESTER, N. Y.

Hosted by Google

The gun is the product of the Garage Equipment Co., Milwaukee, Wis., and can be used for either oil or grease. It is made of 3-inch seamless steel tubing, 9 inches long, with malleable iron top and bottom.

The "Perfect" Combination Oil and Grease Gun.

When used for heavy grease the gear is in mesh with the teeth on the plunger and by turning the crank, very high pressure is obtained, driving the grease thru the nozzle and into the bearing. When used for oil, the gear is slid out of mesh with the plunger and by taking hold of the handle at the top of the plunger, it can be pulled upward or shoved downward with ease, thus sucking in a quart of oil and delivering it to the oiler or the part desired.

The gun holds two pounds of grease and can be filled by screwing off the bottom cap. It is made of steel and iron. The nozzle opening at the bottom is threaded for one quarter inch standard pipe, and nozzle No. 1 and No. 2 is furnished with each gun.

List price in Japaned finish, with one nozzle $3.75; nickle plated finish, with one nozzle, $4.50; extra nozzle, 20 cents.

The Lockwood Primer

The Lockwood Brothers Co., 101-107 W. Pearl street, Jackson, Mich., who operate a garage, some time ago devised for customers a primer for gasoline engines so that a car motor could be started on the first turn of the crank. This primer met with such favor locally that the makers have commenced to manufacture it for the trade generally and are listing it at $5, each primer being sent with a guarantee of efficiency or money refunded.

The Lockwood Primer is arranged for attachment to the dash, and consists of a receptacle for hold-

All pipings, unions, wood screws, e are furnished with the primer. The w of installing it can be done in thirty n utes, as one hole drilled and tapped intake-pipe and one hole drilled thru dash are sufficient.

"Red Cross" Lubricants and Soap

Auto Oil Co., Jackson, Mich., makes a of oils and greases especially adapted to au mobile use and marketed under the br "Red Cross." Its chief product is the Cross No. 100 non-carbonizing oil which as name suggests will not carbonize, accord to the claims of the maker. No. 100 i light body oil of pale color and is rec mended for both air- and water-cooled in all seasons. In first using this oil i advised that, after a few days use a tea ful of wood alcohol be put in each cylin while hot and allowed to stay there over n after which the engine should be started the exhaust opened after 10 minutes run to allow the carbon deposits to escape. oil is put up in gallon, 5 gallon, 10 gal ½ barrels and barrels, prices ranging from to 40 cents per gallon, according to quan purchased.

This line also includes light, medium heavy oils for gasoline motors, oil for st motors, a multiple disk clutch oil and a tr mission oil, also a graphite lubricant. company also makes a pure linseed oil for cleaning bodies, leather, plush or ra upholstery, etc. This soap has the sistency of heavy vaseline and is of a amber color. Price is 6 cents per poun barrel lots up to 12 cents per pound in pails.

John A, Thompson & Co., having h quarters at 204–208 Jefferson Avenue, Det Mich., act as factory representatives for sev makers of automobile accessories and four travelling men. They solicit car m facturers only and work on a commis basis. They have met with gratifying su during the past year and are taking on sev new lines for the coming season. They handle Atwood lamps, Shain ignition app tus, Ball carbureter, Gustave Cornelis Co's brass and copper tubing, Contin

FLYER

LAMBERT, "MODEL M."

This five-passenger, side-entrance car, with a detachable tonneau, is especially built to supply the increasing demand for this, the most perfect, practical and popular car.

SPECIFICATIONS, MODEL M

Wheel Base—105 inches.
Tread—56 inches.
Frame—1½ x 3 x ¼-inch angle steel.
Wheels—32-inch wood artillery.
Tires—32 x 3½-inch pneumatic.
Motor—Rutenber 4-cylinder, 35-40 H. P.
Speed—1 to 50 miles per hour.
Carbureter—Float feed.
Ignition—Jump spark.
Radiator—Honeycomb type, with fan.
Drive—Shaft and bevel to rear axle.
Brake—Internal expansion in each rear hub.
Bearings—Timken Roller Bearings on front wheels.
Clearance—11 inches.
Gasoline Capacity—20 gallons.
Weight—1900 pounds.
Equipment—Cape extension top, two arge gas lamps with generator, two oil lamps, tail lamp, horn, tool boxes on running board, full tool equipment.

PRICE—$2,000, Complete, F. O. B. Factory

LAMBERT, "MODEL 18."

or "The Car Without a Gear Box," is the simplest, nobbiest and best car on the market for the money.

SPECIFICATIONS, THE LAMBERT 18

Wheel Base—95 inches
Tread—56 inches
Frame—Pressed steel.
Wheels—30-inch wood artillery.
Tires—30 x 3-inch Clincher
Bearings—Hyatt roller and standard ball.
Clearance—12 inches.
Gasoline Capacity—10 gallons.
Painting—Deep red.
Upholstering—Fine quality of leather.

ering the American trade the "Continen-
tal" demountable rim for carrying and us-
ng "Ready-Flated" tires, as the company
alls them. The convenience and advantages
of carrying inflated tires on rims ready
for instant replacement of a punctured tire
are well known and this "Continental"
demountable rim was placed on the mar-
ket to meet this well-defined and very ap-
parent need. It has been on the European
market for over two years.

Continental "Ready-Flated" Tire on the wheels.

The rim is a plain clincher rim and the
ire can be inflated at home and carried on
he car ready for use when needed. The
im is held to the wheel by means of 8
mall wedges, each having a flange ex-
ending at a right angle and therefore ly-
ng flat against the felloe. Each flange has
round hole which registers with a bolt
xtending thru the felloe, screw and on the
uter side. The idea is, of course, to use
hese demountable rims on all four wheels
nd when a replacement is necessary the
nuts are removed from the 8 bolts and
he wedges thus released allowing the de-
nountable rim, which is of slightly larger
iameter than the wheel proper, to be
eadily removed and the extra one with
"ready-flated" tire to be instantly put on.
The wedges are then put in place again
nd the nuts put on the bolt ends. As the
uts are screwed home the wedges are
orced between the wheel and the demount-
ble rim holding the latter firmly in posi-
ion. A brace and socket are furnished
or easy manipulation of the nuts, but any

than one-quarter turn, it is p sible to remove both points fr the cylinder of the engine, cle or adjust, without danger of sho and without the use of tools. multi-cylinder motors this can done without shutting down t motor.

The locking device is a dural ground taper cone fitting, secu ly locked by taper cam shoulde The taper fit makes it absolut gas tight.

Nothing but the best procelains are us and the electrode is a special non-corrosi wire which will stand a very high temperatu without disintegrating.

The plug has been tested for over a ye on both air and water cooled engines and said to give satisfactory results. List pr is $1.50.

The Banker Brothers Co., Pittsburg, P manufacturer of the Banker wind shie now has the necessary measurements file for fitting its shield to the followi cars: Autocar, Buick, Columbia, Corb

GOODRICH TIRES

will carry more cars in 1908 than they did in 1907—possibly more cars than any other make of tires in America. The fact is of no interest to the individual motorist except as an indication of the experience of a very large number of other motorists. No one sticks to a certain make of tire through sentiment;—no product receives such cold-blooded testing as the automobile tire. Hence, the fact that Goodrich Tires are being chosen by the majority simply means that their merit has been *proved* by experience.

The outcome of almost every important road test for 1907 is an invitation to specify Goodrich Tires.

HAM'S TOURIST

It is very powerful, but if you place a candle behind it the results would be very unsatisfactory, therefore the most perfect principle of reflection and projection is useless with a poor light, but the more intense the light the greater the results. This is where our "Cold Blast" principle comes in. It produces a brilliant and intense white flame, which combined with the perfect reflection of our lamps and this powerful lens, throws an immense, strong, penetrating light that you can always depend on.

If you equip your car with a pair of Ham's Tourist Lamps, you'll find that it will not be necessary to use your acetylene lamps very often. They are preferable to acetylene lamps for city driving, as they do not give that blinding, glaring light which is so objectionable and still the light produced is strong enough to serve you with entire satisfaction at any tine, regardless of the condition of weather or roads.

HAM'S "COLD BLAST" Automobile Lamps Are Built for Service

How About Your Tail Lamp?

No doubt you have experienced the trouble usually connected with unreliable tail lamps. If so you will appreciate the good features of a Ham Tail Lamp more than ever. When you have a Tail Lamp on your car that you know is going to stay lit when you light it, you experience a lot of satisfaction, I'll tell you, and you'll find that pleasure will be all yours if you equip your car with HAM'S LAMPS.

Specify and insist on getting HAM'S LAMPS. You'll not regret it as they are guaranteed to give satisfaction. Also send for one of our New Catalogues. Address Dept. D.

C. T. Ham Mfg. Co.

The "Stolp" Shock Eliminator

Oscar Stolp, of Sheppard & Stolp, wire goods makers, 18-20 Fletcher street, New York City, has invented and placed on the market a new type of shock eliminator for automobiles. This device is here illustrated, and the cut shows it to be designed on entirely novel lines, usual practice not having been considered in the designing of this device, which is wholly original and has been planned to meet certain definite requirements as perceived by the inventor.

It will be seen that the regular body spring is pivoted to a bar (5), which is a part of the shock eliminating device. When the car wheels pass over an inequality in the road surface the axle is forced up and the springs (3) are comprest slightly as they strike, and at the same time the forward end of the lever (5) is thrown downward by turning on the pivot in bracket (4), the lever then

Rear end of a car fitted with a "Stolp" Shock Eliminator: 1. Side frame of the vehicle, the rear extremity of which curves downwardly as is the usual case; 2. Hanger and link which connect the opposite end of the spring 3, with the side frame; 3. Bottom half of an elliptical spring which is placed under each side frame; 4. Bracket rigidly clampt at the center of the spring 3, and pivotly attached to the lever 5, near its rear end; 5. A lever the most essential element of the apparatus and having its forward end off-set to carry it nearer to the frame; 6. Rear axle tree carrying the rear wheels and having a pivot or journal connection with the rear of the lever 5; 7. Casing suspended from the frame and receiving the forward end of the lever 5, which is governed by a light coil spring connected at the top of the casing to the top of the lever.

oscillating slightly until it again assumes a normal position. It thus appears that the force of the wheels and connecting parts moving either to or from the vehicle frame is transmitted thereto in the shape of two opposing forces, respectively applied thru the spring (3) and the spring in the casing (7), and since these forces are opposed to each other their combined effect on the bed or body of the vehicle neutralize each other, and no shock follows.

In the same manner the front wheels carried on the front axletree may be mounted and the eliminating action made perfect. The front axletree should be attached to the levers at the rear end of the latter's pivotal connection.

The coil spring (7) is attached to the car body short of the center, as shown in the cut. In action when a depression or elevation is met with in a roadbed, the axle of the car is forced up, but the body of the car is restrained from rising by the coil spring and the lever (5) on which it rests. The aim is to keep the car at a normal position at all times by offsetting the oscillation following contact with a rough road by the resistance of the coil spring and the equalizing qualities of the lever.

One of the most interesting claims made for this device is that it saves a very large percentage of tire expense and permits the use of solid tires without lessening the comfort of the passenger or increasing the wear on the machinery.

The "Velvet" Shock Absorber

A very simple type of shock absorber was recently brought out by B. C. Mears & Co., 1300-1304 E. Lexington street, Baltimore, Md., its simplicity being apparent at a glance, as will be seen by reference to the accompanying drawing. It consists essentially of a strap or band looped around the car axle, an oil tempered spring (D) and a bolt to connect the spring with the car frame.

The "Velvet" Shock Absorber.

To attach the device to a car, a block of wood (A) is first placed in the channel of the frame and the steel bolt (C) is past thru an eye formed at the upper end of the spring, thru the wood block (A) and the frame. A washer (B) is provided to prevent the spring from wearing the block (A). The strap is made either of water proof leather belting and fitted with steel buckle as shown, or of rubber-coated, non-stretching canvas belting and fitted with a special clamp.

It will readily be seen that as the car springs are deprest by a jolt no resistance is offered by this shock absorber, as the strap simply drops as the frame falls toward the axle. On the rebound, however, the spring (D) resists the upward motion of the vehicle springs sufficiently to absorb all unusual violence of the same. For adjustment it is only necessary to load the car and tighten the strap. A set of four of these absorbers lists at $12.

The Bausch & Lomb Optical Co., the Bausch-Lomb-Saegmuller Co., of Rochester, N. Y., and the Carl Zeiss Optical Works, of Jena, Ger. have joined interests with the intention ultimately to manufacture in the U. S. and its possessions, the products of the Carl Zeiss Works of Jena.

TIRE BARGAINS

We have just closed a large contract with one of the largest and best known Automobile Tire Manufacturers in the world. We made a very large purchase in order to get the lowest price, enabling us to sell accordingly.

Owing to the very low price we are selling these goods for, we are compelled to withhold the producer's name. However they are all new, clean 1908 product, every tire and tube bearing the manufacturer's name and backed by their season's guarantee.

The terms of this sale are absolutely cash with order. At the very low price we are offering these goods, we cannot afford to sell them otherwise than for cash.

Remember, Every Tire Backed by Manufacturer's Guarantee. Do Not Delay But Send in Your Order To-Day

We agree with every purchaser of one of these tires that if upon examination he is not satisfied with his bargain the same is to be returned to us and his money refunded.

Again we repeat, that the first quality tires quoted on this sheet are absolutely 1908 product and every one bears manufacturer's name and is fully warranted for the current year.

Table of Sizes and Prices of 1908 First Quality Tires, Tubes and Casings

Size.	Complete.	Case.	Tube.	Size.	Complete.	Case.	Tube.
28 x 2½	$16.00	$12.75	$3.15	28 x 3½	$27.90	$22.60	$5.30

but it is now made by N. B. Petry, 418-424 Commerce street, Philadelphia, having formerly been made by another concern, but recently improved by the present manufacturer both in usefulness and appearance: the prongs or hooks have been lengthened, which makes it much easier to operate on the large size tire casings, and the bright parts have an anti-rust finish, preserving the tools in

The 1908 "Pilliner" Tire Tool.

stock and in use. The rubber handle also has been made heavier, making it easier on the hand of the user. The "Pilliner" tool is designed to obviate injury to the casing.

What will appeal to the automobilist and to the dealer, however, is the fact that the price has been reduced from $2.50 each to the reasonable price of $1.50 each, which will greatly increase its sale. The lower price will no doubt appeal to the user, and the increased quantity sold will make it more attractive to the dealers.

"M. & B." Oils, Soap, Etc.

McLean-Brandon Oil & Paint Co., 63-67 Long Wharf, Boston, Mass., manufacture a line of high grade cylinder and engine oils, belting, packing, automobile body soap, etc., and are American agents for "Velure" a paint for automobiles, boats, etc.

Their line of lubricants includes the "M. & B." combination cylinder and bearing oil for gasoline engines and the "Swastika cylinder oil both of which stand a high fire test and are especially adapted

Who Dares

How very few manufacturers stand ready to back the article they make "WITH A LONG TERM GUARANTEE"—that the article will prove to be all that they claim in their advertisements.

WE DO

We guarantee our Speedometers for five long years, against everything but misuse. This guarantee is absolute and unqualified. It has no strings to it—no holdbacks, no reservations of any kind. It don't cover some one part only, but applies to the entire instrument

Absolutely for Five Years

Our guarantee also covers the famous Stewart Flexible Shaft, Swivel Joint and all connections. We are the only Speedometer manufacturers guaranteeing the instrument and equipment complete. We know that our Speedometers and their equipment are really superior to all others, regardless of price, and back our claims with the most liberal Speedometer guarantee ever issued

GRAY & DAVIS

or motor cars, to protect the lamps, radiator, etc., from damage from collisions caused by horse vehicles and other motor cars backing into a car. In shifting cars in the garage danger of collision is also imminent and a protection of this sort may often be the cause of saving a great deal of money and annoyance. The bumper is also useful in head on collisions of any kind and in case a pedestrian is struck by a car.

The "Sager" Protection Bumper.

The "Sager" Bumper consists of a neat tube extending across in front of the car with its ends bent slightly rearward. This tube is held on two bell cranks which are held in position by helical springs fastened to the front axle, the bell cranks being swiveled on the front spring eye bolts. The springs encircle the lower ends of L-shaped stud bolts securely fastened to the frame.

Two styles of this bumper are made, one finished in black and the other in brass. The plain finish style can be painted to match the finish of the car. This style lists at $18. The other style is made of steel lined brass tubing, the outer brass tubing making a very durable and handsome finish. Price is $25.

Oakland

The automobile manufacturer of today is down to "brass tacks"—he's up against real competition.

Hitherto he has been very much in the position of the man who served ice cream at a Sunday school picnic—the demand exceeded the supply.

The result was that the cost of manufacture didn't worry him very much. It was a case of get the cars out, no matter what they cost.

But this year the wise manufacturer is choosing his market. The field for the light runabout and the heavy, high-powered luxurious touring car is already in the hands of three or four manufacturers.

But how about the field for the the medium-priced car—a sensible, serviceable every day automobile—one that doesn't cost a small fortune to buy or an average income to maintain?

The manufacturers of the Oakland have seen this opportunity, and the result is the Oakland car—in two models—roadster and touring car, light in weight, ample in power, and stylish and handsome in appearance.

The power equipment of the Oakland is our two-cylinder vertical motor, here for the first time successfully worked out, and brought to full efficiency, without vibration. The number of adjustments throughout the Oakland are less than half those in other cars of its class, thus insuring simplicity and economy.

We shall be pleased to correspond with those who are in the market for this type of car, or with agents who realize with us the wide possibilities of a car properly built on these lines.

New "Cullman" Differentials, Sprockets and Brake Drums

The 1908 catalog of the Cullman Wheel Co. of 1220 Greenwood Terrace, Chicago, Ill., shows several important additions to the line of differentials, etc. made by this widely known, long established concern. It is quite indicative of the trend of the times that this concern is making some

Cullman, No. 11, Differential for Runabouts, Buggy Type Cars and other light Vehicles of 15 H. P. or under.

special designs of sprockets and brake drums, differentials, etc., for buggy type automobiles. The Cullman No. 11 differential, one of the new 1908 designs, is especially suitable for use on the counter shafts of this type of car, light touring cars and runabouts of 15 H. P. or less, and for rear axle mounting on very light runabouts of 8 H. P. or less of a weight not exceeding 800 pounds. The brake drum is 5½ inches in diameter by 2⅝ inches braking surface. The two large spur gears have 18 teeth of 9 pitch and 13-16-inch face engaging three sets of 12-tooth pinions. The hubs of the large gears are 2 inches long and bored for axles from ¾ to 1¼-inches in diameter. The weight, not including driving members, is 15 lbs. All gears are case hardened. Price of the differential only, less driving member, is $17; with sprocket, $20; with bevel gear drive, $38 or $36 according to type selected. No. 12 gear is of similar construction but heavier and prices range from $25 to $46.

No. 21 Gear is for the rear axle of runabouts and touring cars up to 30 H. P., and for the counter-shaft of 40 to 50 H. P. touring cars. The brake drum is 7 inches in diameter and 2⅝ inches across the face. The two driving gears have 30 teeth, 9 pitch, 1 3-16-inch face engaging 5 sets of pinions with 12 teeth each. The large gear hubs are 2⅛ inches long and bored for axles from 1 to 2 inches in diameter. This gear weighs 28 pounds and prices range from $28 to $44.

The new Cullman rear wheel sprocket and brake drum combination is designed for direct attachment to the rear wheel with clips. The sprocket is fastened to the brake drum with cap screws locked by means of a patented spring wire lock to prevent the sprocket becoming loose.

Cullman, No. 21, Differential for Large Cars.

This sprocket and brake drum combination is made in three sizes. No. 1 is for light, high wheel, buggy type cars and will take sprockets of 1-inch pitch with 36 teeth, or larger, with 8½-inch hole; brake drum bored 8 inches. Price complete is $3.50 plus the price of the sprocket which of course is dependent upon the size. No.

NOR'

CLEVELAND, O. Jan. 16, '08.

O. C: Foster, Esq.,
Mgr. Cleveland Branch,
Warner Instrument Co.,

Dear Sir:-- Last year you furnished me with an instrument which I used on the "Mudlark" in my tour from New York to Florida, and it gave us such good satisfaction that I would like to have one of your clock and light instruments for a model "M" Olds in which I will make a similar run this coming week from New York to New Orleans by way of Syracuse, Buffalo, Cleveland, Louisville and Birmingham.

Trusting that you will give this order your personal attention, and that I may receive the instrument in time, as other speed indicator companies have offered to furnish me free of charge an instrument for this occasion. However, I would rather buy a Warner than accept their offers as the Auto-Meter has always given me complete satisfaction.

I remain, yours very truly

R. R. Owen.
Oldsmobile Co

November 21, 1907.

THE AUTOMOBILE.

BUNK

¶ Webster says "Bunkum" means speechmaking for mere show—mere talk. It aptly illustrates the advertising methods of some Speedometer manufacturers. There's a lot of "bunkum" about wonderful tests in tours and races. In most of these events the Speedometers used are not selected and paid for by the car owners, but are installed by some Speedometer manufacturer, free of charge, for advertising purposes.

"Bunkum" concerni-

THE $2000

THE STANDARD OF AMERICAN AUTOMOBILE VALUE

Mitchell

Perhaps you've noticed that most cars cost more than the Mitchell. Did you ever notice that they were any better in finish or in material—or any better in **performance**—on the road?

Ride in a $2000 Mitchell and **see.**

Have any Mitchell agent "show you" a Mitchell.

Look it over—go out into the country and test it on the toughest hill you know of—through some particularly bad stretch of sandy or muddy road. Notice your power—notice speed—notice the sweet running motor—the tranquil action of all moving parts—ease of control—notice general efficiency, Mr. Prospective Owner.

Then if you can see how you'll get two or three thousand dollars more automobile value out of any other car—**buy** the other car, we won't say a word.

But you won't **find** more value in any other car.

Present day automobile value is **standardized in** the **Mitchell** at **$2000.**

A demonstration will prove this to **you.**

You are under no **obligation** to buy when you ask for a demonstration.

If you are considering the purchase of a car we want you to **know** the Mitchell, and we want **to show** you what you get in a Mitchell at $2000 and that you can't get any **more** in **any other** car, **regardless** of the price.

Call up the Mitchell agent.

The Right Price for the Right Car

warm, soft and pliable, specially suited to the chauffeur's requirements.

The unlined glove has an elastic web wrist.

"Wallace" Automobile Robes and Overcoats

The Hugh Wallace Co., of Detroit, Mich., makes a complete line of overcoats and robes for both men and women's wear. For the atutomobile trade this concern makes a specialty of the "Wallace Montana," imitation Buffalo robe. This is curly wool faced, interlined with rubber, and has an Astrakhan cloth back. Practically all "Wallace" robes are reversible and made either with rubber on one side or with a rubber inter-lining. "Wallace" robes are 54x72 inches.

This concern's overcoats are made in all styles and of all kinds of fabrics and furs. They are usually made in 52 inch lengths.

The "Wallace" line also includes automobile gloves and mittens in Buffalo Fur Cloth, Astrakhan Cloth, Black Manchurian Lamb, Black Jap Martin, Yellow Dog, Black Galloway, Raccoon and Muskrat.

tained in the simplest manner imagi
and the robes are sold at a very reaso
price, hence it is not surprising tha
makers have found this robe a big s

The Cyclone carburetor, formerly

es some of the principles of their 1907 el, but is entirely new in its style and hod of operation. The new method l, the syphon, while old in other me- nical lines, is new in carburetor work.

"Palmbla" Syphon Carburetor; sectional view; lettering explained in text.

his carburetor has but one air intake as it has no auxiliary air valve, it dis- ses entirely with any moving parts or ves. It has only one adjustment (gaso-), and is said to give a uniform mix- e at speeds ranging from 300 to 2500 P. M. The carburetor works on the e principle as the well-known steam hon water ejector or lifter. Referring the sectional view, A indicates an air- t tube in the centre of the float cham- with a gasoline feed nozzle in the cen- of same. E is a cone concentric with fastened to lower end of tube A. C loose sleeve fitted on the outside of er end of tube A and is moved up or n by handle D. This varies the air ning at B to suit different size motors. a fixed opening and is normally set at lowest point. F is a little round base the bottom of the curved mixing tube. mall hole is drilled through to connect the priming cup G. Arrows show the intake openings. The float chamber the throttle are ordinary construction. 45-degree flange connection at H per- s of side or top outlet.

o operate the carburetor the needle ve at the top of carburetor is given one- a turn, and the carburetor primed a primer (not shown) until the gaso- shows in the priming cup at the bot- . The motor can then be easily started the air passing thru at B comes in con- with the fuel coming from the air A, as well as to pick up more fuel

sure in tube A and but a small quantity gasoline flows. As the speed of the mot is increased, greater friction of the a takes place at B, and a consequent mo power of the pressure in the air tube and a greater flow of fuel. Experimen have shown that the flow of fuel is in e act proportion to the air passing throug at B with a fixed opening at feed nozzl If the air opening at B is increased a opening in gasoline feed nozzle is i creased by the opening of the needle val proportionately, the same mixture can had at all speeds of the motor with t exception that the motor cannot be thro tled to as slow a speed as before. F spreading on the road with a light loa the handle D is moved, which increas opening at B. This has the same effe as an auxiliary air opening to intake pi as used on some of the cars for speedi purposes. When the motor stops, the su

apart, making it easy to keep clean and allowing it to be used as a priming cup to prime the engine in cold weather. The plug is the product of G. H. Sherman and Son, 419 St. Aubin Ave., Detroit, Mich.

An improved method of packing the porcelain is used, which consists of packing the porcelain into a metal shell with a special copper gasket, and utilizing the explosions of the engine to hold the porcelain against the packing. The firing pin or central electrode is made in one piece, the head of which is ground onto the end of the porcelain, making a mechanical fit,

The "Sherman" Spark Plug.

thus preventing leakage and avoiding the use of packing. The locking device is simple, strong and durable, consisting of lugs operated by a handle, which register with inclined channels in the body of the plug, so arranged that by a partial turn of the handle the mounted porcelain is drawn onto a copper gasket. To take out the porcelain the locking handle is turned back enough to release the lugs, when the porcelain can be lifted out. To prevent fouling as much as possible the plug is bored out in such a manner that the porcelain is protected, and the spark ...

capacity is such that 20 cars may be undergoing repairs at the same time. It is intended to make it the best equipt shop of its kind in the country. It has a full assortment of lathes, speed drills, drill presses, milling machines, planers, grinders, buffers, a forge, a portable crane with which to take out motors, transmissions, etc., and four pits. These pits are each about four feet wide, four feet deep and 10 feet long. The shop is as light as all outdoors as it has twelve skylights, filling almost the entire roof, as well as large windows on all four sides. It has tremendous work benches and room for many scores of workmen.

Retail Notes

Algonquin Motor Co., The, Boston, agent for the Oldsmobile, has finished the alterations and improvements to its salesrooms. Arthur E. Adams is manager.

Borderwisch Automobile Co., of Dayton, Ohio, will be reorganized for the purpose of continuing the business on the plans determined upon by its late head, Mr. Borderwisch, previous to his death.

Bradford, T. C. Co., of Wilmington, Del., has leased the Tanguy Bldg., at Delaware ave. and Tatnall st., and will remodel it and convert it into a garage.

Burkleo & Stephen, Oak Park, Minn., have opened up an automobile repair shop on 2d st.

Buick Motor Co. has opened a branch at 415 Massachusetts ave., Indianapolis, Ind., to be conducted under the style Buick-Losey Co., R. H. Losey being in direct charge of the business.

Derry Auto Co., Derry, N. H., has sold garage and machine shop to J. O. Thomas and B. R. Melcher, who will conduct the business under the same style. The new proprietors are open for the agency of any good-selling article pertaining to the automobile trade.

Dingley, Bert., Modesto, Cal., opened his new garage, at 719-721 10th st., on New Year's day.

Dunning, D. R., Portland, Oregon, has completed a new 35x100-foot brick garage on E. Oak st., near E. 3d, which cost $3000.

Ellenbeck & Muller, of Brooklyn, N. Y., recently opened a garage and repair shop at 912 Bedford ave.

Franklin, H. H. Mfg. Co., Syracuse, N. Y., has appointed H. G. Kilbourne, a well-known mechanical engineer, as its Boston manager.

clincher tire vulcanizing outfit, which it is claimed will entirely prevent burning of the clinchers, as it cures only the new gum without heating any other part of the tire, thus avoiding disintegration of the tire from over-vulcanization.

The "Ogden" Clincher Tire Vulcanizing Outfit.

This apparatus will repair blow-outs, retread and re-cover outer casings. It is especially designed for repair shop use, and is furnished with all bench tools, tube vulcanizer, and moulds for 3, 3½, 4 and 4½-inch tires for $200. Steam boiler, pipe and connections are not included. Separate parts can be furnished if desired. Tire moulds, 3 and 3½-inch complete, list at $55.00; 4 and 4½-inch complete, $65.00.

"Avery" Illuminated Demonstrator Signs

Avery Portable Lighting Co., 18-22 Martin St., Milwaukee, Wis., is now producing for dealers illuminated signs for day and night use on demonstrating cars. These signs can be attached to the back of the car or to the radiator and when used on the rear of the car take the place of a tail lamp. These signs are intended to be used in conjunction with the "Autogas" acetylene tanks made by the same company. The pipe line from the gas tank to the headlights is tapped and an additional connection made for the sign which is illuminated by two small jets consuming very little gas.

The front of the sign is made of stained glass, the letters being white and the background red. The letters are about 2 inches high. Price of the sign is $4.00 list with a discount to dealers. License numbers can also be furnished in this style.

New Agents

The Glide will be handled during 1908 by the Du-

man at Minneapolis under charge of M. J. I and Teddy Dey.

The Thayer Automobile Company, Marinette are now representing the Buick and Pope cars.

The Ideal Plating Co., Boston, Mass., m Ideal handle bars, inform us that it is now sented on the Pacific Coast by M. A. Bryte, S ket St., San Francisco, and in the Middle W Hastings & Anderson, 116 Lake St., Chicag have a full line of samples and will take up ies formerly referred to the factory.

The York Motor Car Company, of York, Pa., an the following as new agents for the York Pullman Randall Company, Boston, Mass.; Grant Gasoline C pany, Providence, R. I.; J. P. Sullivan Compan London, Conn.; Star Motor Car Company, Newark N. A. Barnett & Co., Cranford, N. J.; E. Gibson Co Indianapolis, Ind.; Thomas & Tolman Auto Compa kane, Wash.; Hernandez Automobile Company, Cuba; Automobile & Machine Motor Company, Ch N. C.

The Logan Construction Company has placed its ship for Cuyhoga County with the Southern Moto Company of Cleveland with offices at 805 Citizen and garage at 6410 to 6414 Detroit Ave.

George A. Haws has placed the agency for Panha mobile cylinder oils and lubricating compounds with L. H. & B. I. Bill, 132 Valencia St., San Francisco, will represent them on the Pacific coast, including Ca Oregon, and Washington Territory. Also with Leon & Co., 226 Columbus Ave., Boston, Mass., and Nock Co., 126 No. 4th St., Phila., Pa.

nary standard handle-bar and, when us allows any position of the bar from iow drop to a high upright position. is claimed to be strong, neat, simple a convenient. The list price is $1.30; or may be had with bar complete for $2. Discounts are given the trade.

"Persons" Motorcycle Tool Kit an V-Belt Fastener

The Persons Manufacturing Co., Worc ter, Mass., manufacturer of the well-kno Persons motor saddle, has recently add two new products to its line, namely, motorcycle tool kit and a V-belt fasten both of which are here illustrated.

"Persons" Motorcycle Tool Kit.

The tool kit is made of full-weight c sole leather, the front, bottom, back, and flap all being one piece. The ends double hand stitched in with waxed fl

Digitized by Google

ose, and the kit to slip from its place.

A special feature of the kit is that it will o on the top tube of any motorcycle in hich the tank is carried below the top ube, without its being necessary to en- rely remove the tank in order to get the ollars attached.

The retail price is $2.25, but for thirty ays the Persons Manufacturing Co. will end one of the kits by express prepaid to ny user upon receipt of money order for 2.00.

"Persons" Fastener for V-Belts.

The Persons belt fastener is designed articularly for V-shaped belts of two or ore ply. It is constructed so that the nd of the belts can be brought up snug gainst the axis of the hinge, keeping the ontact surface of the belt to the highest ossible degree of efficiency. The pin or xle of the hinge is not a straight rod as ight be imagined, but has an increased iameter in the middle, thus evenly dis- ributing the wear of the butte and at the ame time without riveting the ends. The olts are machined from a special bar steel ⅛-inch in diameter.

The fasteners are provided with large, eavily copper plated steel washers to bring e full surface of the belt in contact with e pointed offsets on the faces of the inges, thus evenly distributing the strain n the leather. A sample fastener will be ailed to any rider for 22 cents, while a iscount is given the trade.

"Capitol" Motorcycle Specialties

Several attractive sundries are offered e cycle trade by Capitol Specialty Co., 65-469 Madison Ave., Albany, N. Y., in- luding a combination stand and luggage arrier, a tool box, a chain idler, a spoke nd tire protector and a reserve pedal.

The stand is made of flat metal strips

The "Capitol" Motorcycle Stand.

the Indian. Of course, the device is nished for all makes of motorcycle pedal cycles. It is held up in running tion by a thumb nut and bolt, and it very simple matter to swing it under machine when needed as a stand. I is $5.

The "Capitol" tool box is of tubular f made of tin, and clamps on the top of frame tube that runs from the hea the crank hanger. It consists of two m bers, one telescoping within the other a half turn of the outer member open closes it. It has a fair capacity, its di sions being 16 in. long and 2½ in. in d eter. Price is $2.50.

(1) "Capitol" Tool Box for Motorcycles; (2) Chain I (3) Spoke Protector.

Their chain idlers are furnished t all makes of chain-driven machines, lists at $2.25, nickeled. The spoke and protector is for the purpose of preve the chain from cutting spokes. It con of two flat rods arranged to clamp on

Answers to Motor Cycle Questions

BY CHAS. H. METZ

HOW TO INSTALL SEPARATE IGNITION SYSTEM.

DEPOT COMMISSARY, MANILA, P. I

As an interested reader and subscriber to your valued Journal in these Islands, I would like to get straightened out on the following:

How can two systems of ignition be accomplished on a "Brown" (English) twin cylinder motorcycle? It has mechanically operated inlet and exhaust valves and magneto gear driven. A contact breaker is necessary for batteries and the gears driving magneto are on that side. Another plug may be screwed in cylinder over exhaust valve. I desire magneto and battery ignition, as in case of a breakdownof either system, the other may be used.

A brief description of what is necessary in attaching a contact breaker complete and also have the gears for driving magneto, will be appreciated.

Mechanically operated inlet valves certainly do surpass automatic ones on motorcycles, both for high and low speeds, the latter especially. Some of the American makers should take it up. It adds no complication.

Trusting to hear from you through your valued Journal, and thanking you in advance, I am. JNO. F. DORNEY, JR.

We are pleased to hear from a brother Motorcyclist from away off in our Pacific Island possessions. We would appreciate indeed a letter from him telling us more about Motorcycling in the Phillippines, the road conditions, kind of machines used, etc. Our American manufacturers, I am sure, would be interested to know what conditions are to be met to secure the trade in the motor line, which now is open to them.

We have heard it argued that the Islands were going to be a source of trouble to us, but did not expect it to strike so near home. The Brown being an English make we have not the detailed imformation at hand to advise you definitely how to install a separate ignition system in conjunction with the magneto. However, we take it that the timing gear arrangement on the twin is similar to the single cylinder so we will illustrate a device which may answer your purpose.

The gear which drives the motor shaft undoubtedly revolves at one-half crank shaft speed so you could use a continuation of this shaft for operating the spark timer, but it would be better to use the intermediate gear, as it would allow the removal of magneto in case of repair. This gear, of course, would need to be of the same size as the half time gear and should be extended through the cover in the manner shown. The ball contact device which we have illustrated has proven itself very reliable We might suggest, if you expect to use a dry cell battery, that you arrange for four cells, using two in circuit with a switch to alternate with the other two. In this manner you will get fully double the mileage with a very little sacrifice in speed.

The accompanying drawing represents a side view and section of motor and case in part. The spark timer case is shown with cover open for inspection. The shaft 2 is flattened and drilled near its end to permit a contact bolt 4 to be clamped in place. The shaft 2 is revolved by half time gear 1, causing the hardened bolt 4 to come in contact with hard steel ball 8 at each revolution of the shaft.

The contact with ball 8 completes the electrical circuit through spring 16 and plunger 14 by being connected with interruptor terminal 18 of the induction coil, and a spark is produced when the bolt 4 leaves contact with the ball 8.

The spark timer is made up of three principal parts: The shaft 2 has a bolt 4 clamped in place by nut 6, and is rotated by gear 1 keyed to shaft. The case 5 is held against the gear cover by nut 3 rotating on a projection of the gear cover. The case has a cover 20 held in place by screw 21. The ball contact is composed of a socket 7 into which a ball 8 is held by a spring 16 and plunger 14, these are also held in place by the cap nut 13. The ball contact is clamped to the case by means of a shoulder on socket 7 and nut 12 having insulated washers 10 and 11 to prevent electric current from short circuit except through wire 18. 17 is a contact spring pressing against end of shaft to insue a good ground connection of shaft 2

REVERSING MOTOR BY SPARK TIMING.

ST. LOUIS, MO.

Would you please tell me if a gear drive Indian Motorcycle can be reversed for a chain drive just by different timing. I have heard a new crank case is necessary on account of the different position of the cogs on the spark and exhaust cams. I am a subscriber. Hoping to see an answer in the next number. I am, Respectfully yours, T. J. MOSS.

The motor may be reversed by timing. Note the position when exhaust valve closes, also when spark takes place. Set the gears so that these operations will take place relatively in connection with the piston movement, when fly wheels are revolved in opposite direction.

Sometimes the exhaust valve cam is formed to cause a quick action in opening, and a slower one in closing. This may effect the running somewhat when motor is reversed, but usually the cam is made so it can be reversed. The same is also true in regard to the ignition cam.—C. H. M.

WHERE IS THE TROUBLE?

PATERSON, N J.

Having read at different times the valuable information you give in your answers to motorcycle queries, I take the liberty of telling you my motorcycle troubles.

I have lately purchased a second-hand motorcycle of French construction called the "Diamant," which I thought could be put in good running order, but for some reason, not known to me, it will not work as it should.

It is a 2 H. P. machine with mechanically operated valves.

The intake valve is $1\frac{1}{16}$ in. in diameter at largest point, the exhaust $1\frac{1}{4}$ in., the bore $2\frac{3}{4}$ in., and the stroke is 3 inches.

The compression is good, also the spark. I at first thought the trouble was in the carburetor, so I put in a new Curtiss carburetor but obtained no better results. I can get things adjusted so it runs well in the stand at all different speeds but when taken on the road, it does not develop power enough to carry me up a slight grade, and sometimes when running at high speed in the stand it stops short without any apparent reason.

The feed pipe from the carburetor has a $\frac{5}{8}$in. hole and is 12 in. long.

Do you think it probable that it is not large enough to feed cylinder with enough mixture?—PETER THOMPSON.

Your trouble would not seem to be in the intake pipe although this could be $\frac{1}{8}$ larger to give best results. The intake and exhaust valves are in correct proportion, and if these lift, say $\frac{7}{32}$ for the exhaust and $\frac{1}{8}$ for the intake the trouble is not likely to be there. It is important that the valves seat themselves properly. They should have about $\frac{1}{32}$ in. clearance between stem and plunger when at lowest position. Have known of motors working in the manner you describe on account of valves not seating, there being only a very slight clearance between stem and plunger when the engine was cold. The expansion when heated up caused the plunger and stem to lengthen sufficiently to prevent the valve from seating. The trouble might also be in a choked muffler.

There are so many causes for loss of power that it is impossible to locate it definitely from the description given, so the best way is to first be certain what the proper working conditions of such a motor are, as given by the makers, then trace out each thoroughly and you are pretty sure to locate the difficulty. We shall be glad to h ar from you if you locate the trouble. —C. H. M.

EXPERIENCES WITH PICRIC ACID.

OAKLAND, CAL.

Would like to give your readers the benefit of my experience with picric acid as used to increase the power of gasoline motors.

The druggist of whom I procured it said it was very dangerous, being explosive by concussion or heat.

I first put a piece the size of a grain of wheat on an iron block and dropped, by means of a string, a $2\frac{1}{4}$ lb hammer on it several times, standing some distance away. This had no effect so took the hammer and struck it violently, with no effect, so concluded it was not so dangerous after all. I next put about $\frac{1}{4}$ teaspoonful in about 2 oz. gasoline and let it stand 15 or 20 minutes stirring frequently and found it only slightly soluble. On igniting this it burned, so far as I could see, just as if it were gasoline alone. Upon examination I found the acid crystals had been entirely consumed leaving no residue. I then concluded it was safe to try it on my motorcycle so I put one tablespoonful into 3 quarts of gasoline and let it stand about one week shaking occasionally. Not more than one-half of the acid dissolved giving the gasoline a yellow color and forming a yellow precipitate. Upon trial I found the engine which is 4-cycle 2 x $2\frac{1}{2}$, gave noticeably more power probably about 10 or 15%. Wherever a drop of gasoline was spilled a yellow deposit (the acid crystals) was left.

I made inquiry of one of the professors in chemistry at the University of California, as to the nature of Picric Acid and he said that, "lyddite" used by the British in the Boer War was nothing more or less than Picric Acid and we all know how treacherous it proved.

He said, it was only slightly soluble in gasoline, kerosene or alcohol but readily soluble in water. When dissolved in the above fuels it is probaoly less explosive than in crystals, but the danger lies in evaporation of the solution leaving the dry crystals which might be easily exploded and if this happened near the opening of the gasoline tank disaster could readily follow. It is like nitro-glycerine and some other explosives. Slight concussion may set it off under some conditions and under others it might take considerable.

So I feel thankful I did not get my head blown off in my experiments. E. R. NASH.

PROPORTIONS FOR RACER.

PHILA. PA.

I intend building a speedy and powerful motorcycle engine and come to you for help. Engine is to be $3\frac{1}{4}$ in. bore $3\frac{3}{4}$ in. stroke, which I think will give me 4 horse power. What size valves should I use and what compression space should there be? Will 10 in. fly-wheels be large enough? What can I gear this machine up to. PAUL JONES.

Make exhaust valve $1\frac{1}{2}$ in. diameter with $\frac{1}{4}$ in. lift. Inlet valve $1\frac{3}{8}$ in. with $\frac{5}{32}$ in. lift. Compression space 30% of piston displacement. This would be rather high compression for ordinary use, but for power and speed high compression is required. 10 in. fly-wheels with 1 in. face will be ample. Machine if light will stand 3 to 1 gear for racing. C. H M.

INTERNAL VS. SPUR GEAR PLANETARIES

SAN FRANCISCO, CAL.

Will you kindly answer the following questions in the mechanical and technical department of your valuable journal?

1. Why have manufacturers discarded the internally cut gear in favor of the spur gear in planetary gear-sets, notwithstanding the greater simplicity of the former?
2. Which do you think most suitable to use in a motorcycle two speed gear?
3. What is a good book of formulæ for gas-engine construction and where can same be obtained?—D. T. RYAN.

Internal gears are considered more costly than the smaller spurs and this is one reason for their abandonment. I think there are some patents that interfere with the use of the internal in certain arrangements and this may have had something to do with the use of the other devices. Again some makers have taken up some other means of changing speeds and so have abandoned the form they used without in any way condemning it or giving preference to any other form of planetary.

I have always preferred the internal gear because I got a device that was narrower and yet had large pinions and great strength and these are all valuable features in a motor cycle.

H. H. Thorpe & Co., 1256 Michigan Avenue, Chicago, Illinois, will hereafter market the entire output of Armac motorcycles.

I. Whipple, of Chicago, Ill., has been chosen to act as Western distributor by the Harburg Tire Co., for the Harburg motorcycle tire made in Germany.

The Hendee Mfg. Co., manufacturer of the Indian motorcycle, has established a branch depot at 1251 Michigan Ave., Chicago. The building is a two-story structure, 35 x 125 ft., and is located directly opposite the new Southern Hotel and in the heart of the automobile district.

The Royal Motor Works, Worcester, Mass., announce that they have secured Eveleth V. Hill, formerly with the Worcester Pressed Steel Co., to act in the capacity of sales manager of their product.

As a result of strong and convincing testimonials received by the Kansas City, (Mo.), Police Commissioners from the Chiefs of Police in St. Louis and New York, regarding the advantage of using motorcycles in the police department, the Kansas City commissioners have decided to buy three machines.

THE AUTO-BI

A Successful Motor Cycle

Should have plenty of power to climb hills easily.

Should have a practical (tried and tested by the public) method of transmitting pow n engine to rear wheel.

Should have a grip control which will not tire the wrists by hanging on to a loose gri yet be under the instant control of the rider.

Should be equipped with an auxiliary exhaust port to keep motor cool, and add ver and speed, by getting rid of exhaust gases quickly.

Should have motor hung as near the center of machine as possible and very low to ma chine steer easily and so the rider does not have to *straddle a hot motor*. Motor should ced as near horizontal as possible so that explosive force and vibration is exerted on a li h momentum of machine and rider, thus doing away with vibration.

Motor should have solid forged crank shaft *hardened and ground* to *size* (all automobil one piece shafts ; why ?) inside of motor should be easily accessible without removi tor from frame. Cases split horizontally, as in the Auto-Bi, allow this.

Truss spring cushion forks are indispensable for safety and comfort.

It should be equipped with flusher valve for easy starting at all times.

It should have ample tank capacity for touring purposes.

It should present a graceful pleasing appearance with each part in harmony and bu the particular purpose to which it is put.

A SUCCESSFUL AGENT

Will insist on securing a motorcycle which includes each of the above features. Tl l assure him of a machine which will be easily sold, and will stay sold, and a motorcyc ch he can recommend and build up a business with.

A SATISFIED CUSTOMER

The buyer of the 1908 Auto-Bi will get a machine that is guaranteed for the year. It e, comfortable, powerful, speedy, can be easily controlled by the novice, and is a strict

Experience of Commercial Motor Car Users

Gas Company Uses Both Motor Cars and Horse Wagons

Springfield Gas Light Co., Springfield, Mass., use four motor cars, all gasoline machines, in addition to a number of horse drawn vehicles including dump carts, drays and business wagons. This company considers it advantageous to employ both classes of vehicles in their business and finds comparison of the two methods of transportation difficult in view of the fact that each method seems to have its own peculiar advantages in its line of business. Generally speaking, it uses the horse drawn vehicles for nearby hauls and the motor cars for long distance work. Two Knox machines are used, one a single cylinder car with a carrying capacity of about 1,800 pounds, and the other a 2-cylinder car of 2,500 pounds capacity. These two cars are used in general jobbing work around town. An Atlas 3-ton truck is used for hauling pipe, coke and heavy material used in this company's business and a Cadillac single cylinder runabout is used generally. The company is unable to state how many horses have been displaced by the motor cars as it has added to both horse and car equipments.

The ignition system seems to have been the chief source of trouble in this concern's experience and it suggests as the most needed improvement better batteries and battery connections and spark plugs that will not soot.

Good wages are paid by this company and only good men hired; hence no trouble has been experienced on this score. The machines have been stored in a public garage but the company contemplates the erection of a garage of its own and feels that this arrangement will be advantageous.

Detroit's Municipal Automobiles

Motor cars are used in several municipal departments of the city of Detroit, Mich., and a recent report of the finance committee relative to the expense of maintaining these cars is of interest. This report covers the six months from July 1, 1907, to January 1, 1908, and the figures for three departments having two cars each is as follows:

	Public works	School board	Parks boul.
Chauffeurs	$366.00	$399.00	$360.00
Gasoline	76.88	84.02	132.44
Lubricants, etc.	39.01	22.60	14.04
Repairs, renewals	281.26	172.20	619.53
Storage and care	132.00	165.80	.....
Insurance	.....	62.19	.....
Totals	$895.15	$905.81	$1,117.01

Altho charges of extravagance have been made against the school board in reference to the expense of maintaining its cars the report shows that the school board's machines are operated more cheaply than those of the department of public works, if the item of insurance is omitted, and that they cost much less than those of the parks and boulevards department, even though the latter do not run up bills for storage and insurance.

The fire department has three machines which it operates for $1,060.61. The fire department, however, pays nothing for storage, thus saving about $200, nor is the item of insurance included in the total. The school board automobiles thus show up well in comparison with those of the fire department.

The board of health and the water commission each has one machine, costing respectively $395.30 and $464 for the half year. In neither case does this include the service of a chauffeur, nor, in the case of the water commission, does it include storage or insurance.

The Colville & Metaline Transportation Company of Colville, Washington, has recently started an automobile passenger and freight stage line between Metaline and Colville, using two 40 H. P. cars, each carrying twelve passengers, and a four-ton freight truck. Every two days a round trip will be made, thus giving daily service in both directions and connections will be made at Colville with the Spokane Falls and Northern Railroad to Spokane, eighty-seven miles. This arrangement will cut the time of the trip from thirty hours to seven and a half hours and make a route 147 miles shorter than formerly. The present route from Metaline to Colville by boat and rail is 187 miles, while by the automobile stage line it is 40 miles.

Hosted by Google

The Gifford-Pettit Manufacturing Company, 17 Devon Avenue, Chicago, Ill., U. S. A., as organized in May, 1907, to exploit com-ercial cars designed by Mr. A. F. Feldt, who s been between eight and nine years with otor cars in responsible positions and had eviously designed some passenger vehicles.

The first Gifford-Pettit truck, 3-tons paying-ad, was completed in August, 1907, has been oroughly tried out on the road, and a truck ut little changed from the first model, was own at Tattersall's, Chicago, December, 1907 hibition, as the Gifford-Pettit 1908 offering.

NOTABLE FEATURES.

The Gifford-Pettit truck is carefully de-gned by an experienced constructor, and is ell built from well selected materials. The rength is everywhere ample and the four-linder motor, 35 H. P., gives abundant ower. The sliding gear is of the simplest pe, progressive gear-shift, three forward crank and then rely upon the jump-spark start. The hardened steel change gears 5, d. p., $1\frac{5}{8}$ ins.face. The bevel gear coun shaft drive is also of hardened steel, and is 4, d. p. The line and side shafts of the cha gear are in plain phosphor bronze bearing The water-circulation is by a two-pinion pu No fan is used, as the water jackets are large and the water circulation is rapid, abundant radiator surface.

A special feature of the ignition is Feldt hammer-spark action the novelt which lies in the time regulation, w differs generically from anything previo noted by the writer. The hammer-sparl attracting much attention from Amer car-motor designers at the present time, bec it is believed that the large spark-vol produced by the conductor-break fa rapidity of combustion and considerably creases the power of a motor over that ob

Fig. 1. Gifford-Pettit 3-tons paying-load truck. On fair roads can carry 5-ton loads. Wheel-base, 120 ins. Gau s. front, 62 ins. rear, double face solid tires, 36x5 ins. Rear, 36x$3\frac{1}{2}$ ins. "dual", two faces, 8 ins. over all. Moto linders, $4\frac{3}{4}$x6 ins., 35 H. P., 4-cycle, water-cooled, double ignition, jump spark plugs and storage battery for self-startin ms-Bosch low-tension magneto and hammer spark for ordinary service. Progressive sliding gear, three forward spee reverse with bevel gear and 8-pinion spur balance gear to divided counter-shaft, with side chains to rear wheels. Ex d internal rear hub drum brakes and a brake-drum on the counter-shaft. Weight about 5000 lbs. Price, regular 500.00, including 3 lamps, horn and tools.

peeds and a reverse, direct on high-speed ith no change gears engaged. The motive ssembly is on a deeply-dropped sub-frame, ne universal slip-joint is placed in the line haft between the clutch and gear-box, and nother between the gear-box and the counter-haft. The addition of the storage batteries, our-coil box and jump-spark plugs to the able with the jump-spark, other condi the same.

Feldt adds four hammer-spark cams t intake cam-shaft, making a total of 8 on the intake side. The four intake- cams are of usual form and construction. four hammer-spark cams are circular. spark-action lifters are directly over

The Safir Automobile Company, Zurich, vitzerland, working under the Saurer patents, anufactures both passenger and commercial chicles. The motors are all 4-cylinders, cycle, water-cooled, jump-spark plugs with th battery and magneto, in three sizes, 24, 40, d 50 H. P. The 40 and 50 H. P. Motors are aced in touring cars, and the 24 H. P. motor used to drive a 2½ tons paying-load truck, d the 40 H. P. motor is placed in a 5 tons ying load truck. An English Company is so working under the Saurer patents and ese "System Saurer" motor-trucks have en highly successful in continental compe-ions and are regarded as the final thing by e same leading European motor-car engineers. The Safir commercial wagons, 2½ and 5 tons ying-load respectively are handled in the nited States by The Commercial Motor Car ompany, Times Building, New York City, . Y., Chicago Office, 414 First National Bank uilding, Dearborn and Monroe Streets.

A 5-tons paying-load Safir truck was on view the Chicago Show, and the illustrations here ven with a brief general description relate rticularly to the 5-tons Safir, though the me general construction is used in both the and 5-tons trucks.

symetrical, valves on both sides, worked w two cam-shafts. The exhaust cam-shaft c is advanced 90 deg. by a spiral groove feather to enable the motor to work as an compressor for brake effect. The cam-sh are driven by steel and fiber gears. The ca and shafts are integral. The motor-base oil-basin are of aluminum. The oil-basin two pits, with exterior stand-pipes, scr capped, which can be opened to regulate splash-pool to minimum depth, and to cl out dirty oil.

The ignition is by high tension magneto jump-spark plugs, and also by storage batt and coil.

NOTABLE FEATURES.

Besides the use of annular ball-bear everywhere except for the motor connect rods, the Safir truck is notable throughout excellence of design and workmanship.

An air self-start is employed, air being c pressed by a small crank-and-connecting- driven, trunk-piston air-compressor, gear dr from the line-shaft, just in front of the gear-b This pump is thrown in and out of action b solid-jaw clutch, splined to slide on the b shaft. The air-pump cylinder has inte circumferential cooling-ribs or fins. The c

Fig. 1. Safir 5-tons paying load truck, wheel-base, 153 ins. Gauge, 65 ins. front, 68½ ins. rear, double face solid tires, 34x ont, 41½x8 ins. rear. Motor, 4-cylinders, 4 cycle, water cooled, 4–5-16 bore, 5½ stroke, 40 H. P. at 1000 R. P. M. Cone c re shown but is now being changed to small diameter mutiple disk. Selective sliding gear, four forward speeds and a r th bevel balance gear to divided counter-shaft, with sprokets and chains to rear wheels. Weight, 5500 lbs. Price, $5000 The air-self-starting assembly is not a part of the regular Safir truck equipment, but is fitted as an extra, to order.

The Safir design and construction are most aborate and most thorough in every particu-r, nothing overlooked and nothing shirked, ther in materials or workmanship, and, with ompetent drivers, superintendence and up-eep, these cars can unquestionably make a ost superior showing in any company. The rices, are, of course, high, both because of gh-cost construction and because of the im-ort duty, the 5-tons-paying-load truck being fered at $5,000.00. As shown in the illus-

pressed-air tank is piped to a pressure gaug front and the driver carries air pressur discretion. For self-starting the compre air is piped to an overhead branch-pipe br casting which has an opening to each cyli over the exhaust valve, this opening being ered by an automatic-valve opening to motor-piston. The compressed air is di buted to each cylinder by a rotating ver air-valve placed in the middle of the bran air-pipe and rotated by bevel gears from

Hosted by Google

driver's release of the air-admission lever, the air tank pressure might be diminished needlessly. The air-start lever is normally spring-moved to shut the air off from the air-distributing branch pipe. The automatic branch-pipe valves, opening to each cylinder compression-space, close automatically as soon as the motor begins working itself, and so prevent any part of the burning charge from entering the air-branch. The air-start does not require any change of the motor or motor-valves or cam-shaft at all. The air-start is made by giving the air-valve lever a quick push and instantly releasing it, which permits the automatic spring-closing of the air admission-valve.

The air-start compressor cylinder is small, something like 2x2 ins., only, and high pressures are contemplated, the air-pressure guage being graduated to show 30 atmospheres, or 450 lbs.

Another unusual feature of the Safir control is the use of the motor as a brake, by converting the 4-cycle motor into a 2-cycle air-compressor. This is done by opening the intake valves to pure air, after shutting off the carbureter. The cam-shaft is then advanced 90 deg. by a spiral groove and feather and an endwise movement of the spirally grooved sleeve on the cam-shaft, When the cam-shaft is so advanced, opening the intake valves to the atmosphere causes the turning of the crank shaft by car-momentum to work the motor as an air compressor on the 2-stroke cycle.

BRAKES.

The Safir truck has steel casting, rear-hub brake-drums about 20x3 ins. with jointed, grey-iron, internal, expanding shoes, internal 3-hole-lever applied, and a brake band on the balance-gear drum in the counter shaft housing. This balance gear brake drum is about 12 ins. dia, by 3 ins. face, with exterior, jointed, grey-iron shoes, 3-hole-lever applied, metal-to-metal

Fig. 2. Safir 5-ton truck, side-elevation and plan of chassis. The wheels are all on annular ball-bearings, with ball-thrust-bearings. Except the two ends of the connecting rods all the bearings, including those of the crank-shaft, are annular ball-bearings.

The springs are all half-eliptics, front springs jointed to the frame in front and linked in the rear. The rear springs are linked to the chassis frame at both ends, and screw length-adjusted struts are fitted between the rear axle and the chassis frame side. The chassis frame sides are channel steel, 4¾x2–3-16x¼, sides parallel, 39–⅜ ins. wide. The propeller shaft from the clutch to the gear-box has two universal joints. The change gears are all nickle steel, case hardened. All the sprockets are soft. The chain is Renold, roller, 1¼ ins. pitch, ¾ ins. wide. The line and side shafts are on annular ball bearings.

The fuel tank, oval, steel, 25 gallons capacity, is placed in the rear. The muffler is set cross-wise, a little way in front of the rear axle. The compressed air-tank, for self starting, is a copper cylinder, about 6 ins. dia. by 24 ins. long, hemispherical ends, heavy enough to resist 450 lbs. pressure and is placed at one side in front of the gear-box. This air-tank is not shown in these illustrations.

The air-start is always a convenience, and in crowded streets, where delays are numerous, an instantaneous air-start saves fuel by permitting the stoppage of the motor while traffic is blocked without delay or danger from inability to move when an opening is presented.

The fact that this Safir compressed air self-start does not require any change or end-shift of the valves or cam-shaft is worth repeating here with emphasis, as self-starting actions have been shown which involved abnormal valve action obtained at the cost of a shifting cam-shaft and added cams.

contact, run dry. The rear-hub drum-shoes are applied through a balance-gear on the brake-rocker, the brake-rod takes hold of a free rocker-arm which carries a bevel pinion engaging two bevel-gear sectors, one fixed to the rocker and one fixed to the sleeve loose on the rocker, so as to exactly balance the respective pulls on the brake-shoe applying levers.

CONTROL.

The spark is regulated by a small vertical lever on the rear of the front-board. The steering is by a worn and worm gear sector with eccentric-bushing adjustment. There is

one lever on top of the hand wheel which has a neutral position straight ahead and is moved to the right for throttle regulation. If this lever is moved from neutral to extreme left it advances the cam-shaft 90 deg., closes the throttle and opens the intake valves to the atmosphere, converting the motor into a 2-cycle air compresser, thus enabling the motor itself to become a brake to retard the car. This motor resistance, the ordinary brake of this truck, is highly efficient and causes no wear or heating. The 90 deg. advance of the cam-shaft causes the exhaust valves to act as both exhaust and intake valves, and so enables the motor, in connection with the intake valve, to work as an air compresser, 2-stroke cycle, giving two cylinders constantly in work as compressers.

Fig. 3. Saurer Carbureter, Safir Motor. Th s a float feed to two stand pipes, that at the right, in a throat of fixed area, richly charges the air which enters at the left and passes the left stand pipe without effect. The left stand pipe is also in a throat of fixed area, covered by an inclined valve, S, spring-closed. Heavy piston suction opens S and permits parts of the charge to pass upward around the nozzle of the left stand pipe, which has a smaller opening than the right hand nozzle and makes the less rich charge. The throttle T, standing in the plane shown, is turned to regulate the cylinders charge. When T is depressed as far as possible, the passage from the carbureter to the cylinders is closed and the air valve, A, is depressed and opened so as to permit the atmosphere to move both in and out at B, while the motor is working as an air compressor to serve as a brake.

The outside hand-lever works in three planes and shifts the selective change gear. The inside hand-lever is pulled backward to apply the rear-hub-drum brake-shoes. There are two pedals on the foot-board; that at the left disengages the clutch only; that at the right applies the counter-shaft drum brake only.

ON THE ROAD.

A demonstration of the Safir truck was recently made for the National Brewing Co. of Chicago and observed by Mr. Wm. Rehm, its president, when the car carried a load of 4 tons to South Chicago, a distance of between 14 and 15 miles, in 1 hr. and 15 minutes, consuming two gallons of gasoline. The pavements over a considerable portion of the route were excellent, but in many places the streets were entirely unpaved.

On Wednesday morning of the same week it carried two loads of 4½ and 5 tons, respectively, for the Edelweiss Brewery to its La Grange distributing depot all the way over excellent pavements at a gasoline consumption of slightly over one gallon—a distance of 7 miles or approximately 7 miles to the gallon, which is exceptional performance for such a large truck.

The New Atlas 2-Cycle Taxicab

The latest production of the Atlas Motor Car Co., Springfield, Mass., is the small town car or Taxicab, herewith shown. It is powered by an Atlas vertical, two-cylinder, two-cycle, 22 H. P. motor, having only five moving parts, the crank-shaft, two connecting rods and two pistons. There are no cam-shafts, gears, springs or poppet valves, and the cooling is by thermo-syphon circulation, eliminating the pump and fan. A vertical tube radiator is used. The ignition is by jump spark with the timer mounted direct on the engine-shaft, and two coils on the dash. Current is supplied by dry cells, storage battery or magneto. All moving parts of the mechanism are enclosed and run in oil or grease.

PLANETARY CHANGE SPEED.

A two-speed and one reverse planetary is used, the high-speed clutch being of the multiple disc type. The gear ratios are low, 2 to 1, reverse 3 to 1. All shafts and studs are ground and polished and the inside bearings are of bronze, while the two main bearings are Hess-Bright ball. All gears and working parts are hardened and ground to exact size. The friction bands are Raybestos lined, are 10 ins. diam. and 3 ins. wide.

The drive is by shaft fitted with improved extra large splicer joints equipt with hardened and ground bushings and studs.

Two sets of brakes control the car when required. The service brake is 10 ins. dia. by 3 in. face, lined with Raybestos, and the emergency brakes on the rear wheels are of the internal expanding type and 12 ins. in dia., giving an unusually large braking surface for so small a car.

The springs are three-quarter elliptic front and rear, the front being 40 ins. long and the rear 48 ins. long by 2 ins. wide.

The frame is selected white ash, of arch construction, to eliminate sag and reinforced with steel angles.

The rear axle is of the floating type, with

The car is furnished with a canopy top with forged steel stanchions attached to the iron of the main frame and fitted with storm boot for the driver's seat, pyraline being used instead of glass. The upholstering is Fabrikoid, an imitation leather, which it is claimed is more durable than the genuine article.

The three-ton gasoline truck has similar chassis specifications.

THE SIX-TON ELECTRIC TRUCK.

The details of the electric truck have not been materially altered since last year. It has 100 inches wheel base and 72 inches tread or narrower if specially ordered. The springs are platform front and rear, all springs three inches wide and ribbed. The front tires are 6 inches and the rear 7 inches wide. Forty-two cell, 13 W. B. National batteries are used in connection with Westinghouse motors. The bodies are platform or stake as desired. The speed is six miles per hour.

The 1908 Frayer-Miller Commercial Cars

The Oscar Lear Automobile Company, formerly of Columbus, now located at Springfield, Ohio, are offering for 1908, a three and 5-ton truck. The growing demand for truck has necessitated a move into larger quarters and the plant has therefore been moved from Columbus, Ohio, to Springfield where it is hoped the increased manufacturing facilities will allow of sufficient increase in output to meet the demand for such trucks.

The company claims that its observations stow that one truck will do on an average, the work of three taems. The requirements for such service have been carefully studied and it is claimed the trucks are so constructed that all parts are very accessible.

Marine Coming Events

April 1-13—Annual Motor Boat Meeting at Monaco, Monte Carlo.

April 6-11—Buffalo, Convention Hall, Motor Boat and Sportsmen's Show. D. H. Lewis, Mgr.

April 10-15—Regatta for Motor Boats, under direction of Nautical Club of Nice, France.

June—Bermuda Cup Contest for Sea Going Power Boats; New York to Bermuda. New York Yacht Club, Bermuda Yacht Club and Motor Boat Club of America.

July 18—Race for Motor Cruisers; Marblehead, Mass. to New Rochelle, N. Y. New Rochelle Yacht Club.

August 1—Race for British International Cup won last year by "Dixie," Huntington Harbor, N. Y. Motor Boat Club of America. Walter M. Bielings, Secretary, 9 Murray St. N. Y. City.

Marblehead to New Rochelle 270 Nautical Mile Race

The Marblehead, Mass., to New Rochelle, N. Y. power boat race, it is expected will this year be even more interesting than in previous years and the reports are that the number of entries will be large. The race is for cruising boats of not less than thirty feet over all and not more than forty feet over all, and with a water line breadth of not less than one-fifth of the water line length. The distance to be raced is 270 nautical miles. The crew shall not be changed during the race, and must consist of not less than four persons. No paid navigators or pilots will be allowed. Entry blanks and full information may be had from the following members of the Regatta Committee: W. B. Stearns, Marblehead, Mass.; J. A. Mahlstedt, New Rochelle, N. Y. and Walter M. Bieling, No. 9 Murray Street, New York City.

Conditions of New York to Bermuda Race

In the New York to Bermuda race in June, the competing boats must not be more than 70 feet over all nor under 50 feet over all. The rating and time allowance will be calculated in the same manner as last year. The Bermuda Cup, valued at $1,000 is presented by a member of the New York Yacht Club as a challenge trophy to be raced for by seagoing power boats. The trophy is placed jointly in the custody of the Royal Bermuda Yacht Club and the Motor Boat Club of America. It will become the property of the owner who wins it three times.

Prizes offered are as follows: The possession of the cup to the boat finishing first and $1,000 in cash, also offered by the same member of the N. Y. Y. C. This boat will also receive a commemorative shield, presented by the Motor Boat Club of America. Second boat, a commemorative shield, presented by the Rudder. If more than five boats start, a third prize will be given.

British International Cup Race

The challenge recently sent out by the Motor Yacht Club of Great Britain to the Motor Boat Club of America for the British International Cup which was last year won by the "Dixie," an American boat, has been accepted and the course has already been decided upon. The race will be run in Huntington harbor, on August 1.

If elimination trials are necessary for the selection of an American defender, they will be held over the same course during the week ending July 11. There will also be elimination races in British waters if more than three boats are built there to race for the trophy. The length of the course is fixed at between thirty and thirty-five nautical miles, and the only limitation to the size of the competing vessels is in the overall length of the hull, which shall not exceed 33 feet 11½ inches, or 12.18 metres. So far one entry, that of C. C. Wheeler, has been received by Walter M. Bielings, the secretary of the American Club. She is being built at Halesite, Long Island, but as the entries do not close until July 1, it is regarded as certain that several more entries will be made. Another boat is nearly completed at the B. F. Woods yard at City Island, and there is also talk of a turbine propelled boat to be entered by the West India Motor Car Co. The first of the Motor Yacht Club's challenging boats is the Wolseley-Siddeley, owned by Lord Howard de Walden. This boat was launched at Cowes on February 22. It is 39 feet 4 inches in length and has a 6 foot beam.

The Lamb marine engine manufactured by the Lamb Boat and Engine Co., Clinton, Iowa, will hereafter be handled by the Lamb Engine Co. of New York, 92 Chambers Street, which concern will act as general eastern and foreign distributors of the Lamb engine.

The Motor Boat and Sportman's Show closed on Saturday night March 8, in Madison Square Garden, New York City, after a two week's successful exhibition, which drew more than 200,000 visitors.

The "Perfection" 40-45 H. P., 4-cylinder, 4-cycle, marine engine; intake side.

The "Perfection" Marine Motors

We show herewith a 4-cylinder, 4-cycle, -45 H. P. marine engine manufactured by nry L. F. Trebert, 13 Grant St , Rochester, Y. It is also furnished for automobile use. The cylinders are made of fine gray iron, h a crank case of aluminum alloy or cast n. The valves are placed on either side ween the two cylinders and are operated a single cam shaft located in the bottom the crank case. The valves are inter-angeable. The cam shaft is driven by two ge gears located inside the crank case. The pump is mounted on the cam shaft inside the crank case and consists of four parts ich can be easily taken apart. Their is e straight oil pipe, with eight oil nozzles ecting the oil to places where it is required. e water pump is bolted to the outside of the nk case below the crank shaft and is driven the cam shaft.

All pipes are cast brass and highly polished. e aluminum base is not affected by the ain between the cylinder and lower half of e crank case. The bearings can easily be pected and adjusted by removing the side tes. The crank shaft is a solid steel forg- of high carbon steel, oil tempered and ound to size. The connecting rods are steel op forgings, fitted with large nickel babbitt arings on crankshaft end; the wrist pin end phosphor bronze bushings. The pistons fitted with three compression rings and ee oil grooves also with wrist pins of hard-

single unit spark coil, secondary distribut timer, carburetor, wire storage battery, sta ing crank and wrenches, listing at $7 Outfit No. 2 consists of 40-45 H. P. mot reverse gear in fly-wheel, universal joi

For Cleaning Auto Bodies

It's good to see how quickly Mobo removes mud, grease and dirt from an automobile body. It doesn't matter how long the car has gone without cleaning, or how thick the dirt may be—off it comes, easily and quickly if you use

MOBO
Automobile Cleanser

Not only does it remove all the dirt, but does it without marring or scratching the varnished surface, and without dimming the lustre in any way. That's Mobo style.

Mobo is composed of pure vegetable oils, and contains nothing rough to mark the smoothest surface. It is the ideal automobile cleanser.

Prevents the varnish and paint from cracking and blistering. Keeps the car looking new. It's the best sold to-day. Try it once and you'll understand why.

Put up in 3 lb. and 6 lb. cans; also in tubs, half-barrels and barrels. Can be had at the following supply house:

JOHN WANAMAKER,
Automobile Supplies
PHILADELPHIA, PA.

and at all good automobile supply stores in all leading cities.

Send for our Mobo booklet —*"How to Clean Well Varnish and Paint on an Automobile."* It's free.

Matheson

One Year Guarantee

The technical opinions of the best critics of Europe and America, reviewing the general tendencies of automobile construction in the world's leading cars, are given in a book we have just published and which will be sent to any address upon request. This book gives also **some unusually interesting letters of prominent men** of affairs who tell in their own words of the exceptional service qualities of their Matheson cars. These letters are especially instructive, as their authors represent the most experienced class of buyers who have, in many instances, abandoned their foreign cars for the Matheson.

ylinder convertible kerosene and gaso-
e marine motor, built by the Fay &
wen Engine Co., Geneva, N. Y. The
inder construction is different, but in
eral appearance it differs but little
m the standard type of motor.

This machine has the complete gasoline
d the same as their regular type of en-
e and can be operated on gasoline as
fectly as their regular gasoline motor,
with the added advantage that kero-

The "F. & B." 7 H. P. 2-Cylinder Convertible Kerosene and Gasoline Marine Motor.

e can be used as fuel if desired and the
chine operated thereon without the use
any gasoline whatever. The kerosene
l is applied through special needle
ves, which are shown above the ex-
ust pipe in the cut. The kerosene is
ced under a slight pressure in its tank,
more than 7 or 8 pounds being re-
red, and this pressure is obtained by
ans of a power pump furnished with
machine and which on the smaller
es is belt-driven, but on the larger en-
es is direct-connected. The kerosene
k should be supplied with a low pres-
e gauge, and the pressure pump has a
ulating valve which can be adjusted to
intain a steady pressure.

The kerosene charge is ignited by a regu-
electric battery outfit the same as if
soline were used. This also gives a
tly greater range of speed control than
usual in kerosene motors.

The manufacturers claim that with
rosene fuel there is a gain of approxi-
tely 5 per cent. in power over the use
gasoline, and that the consumption per
se power hour is almost identical under

olution of a predetermined controlled tion by which the proper number of nits are communicated to and ab- by the inrushing charge. These s are made in single and multiple er forms with 5x6, 8x10 and 10x10 ylinders. The crank shafts are all adjustable, so as to always maintain perfect alignment as the crank wears down in the boxes. The cam rollers and pins and cams are all of hardened steel. The cylinder heads are removable to permit of easy access to the pistons.

The list price of the twin cylinder, 10 to 15 H. P. motor, here illustrated, with reversible propeller, is $645. This price includes standard equipment consisting of a Schebler float feed carburetor, friction reverse, three fluke solid grey iron propeller wheel, or reversing blade outfit, 6-foot steel propeller shaft with outside bearing and stuffing-box, battery and connections, spark coil, switch, insulated wire, brass circulation pump, brass bilge pump, screen and flange for circulating pump, screen for bilge, monkey wrench, squirt oil can and Monarch non-chocking water-cooled muffler. If salt water fittings are desired, a solid bronze propeller wheel and a bronze propeller shaft are substituted for the steel ones.

The Echo Co., Delaware and Young Sts., Tonawanda, N. Y., build launch hulls to order in any style or size, from 16 to 40 ft. in length.

The David Crockett Co. of Bridgeport, Conn., makes a spar composition for which great durability is claimed. It is made of the best procurable material, the hardest Zanzibar gums, the best oil and pure turpentine spirits being used. It has been used in marine work for years and is said to be free from cracking and blistering.

The "Triumph" Reverse Gears

Triumph Gear Co., 6th and Congress streets, Detroit, Mich., lately placed on the market a reverse gear designed by Walter G. Morley, who is the main factor in the company. The gears and pinions are of high carbon steel, cut on an automatic cutter and hardened. Pinions run on large studs and are bronze bushed. The gear case and cover are also bushed with large wide bronze bearings. Exceptionally large bearings have been provided thruout and are lined with special anti-friction metal which is lubricated and will not cut the shaft if the bearing should run dry. All gears and pinions run in oil.

The reverse band, which is cam operated, is of large dimensions. On the full speed ahead position drive is thru a multiple disk clutch of the automobile type. The gears are then in mesh but do not operate. The clutch is connected directly with the engine shaft, which eliminates the need for couplings and extra shafts and prevents disalignment of the gears.

The Triumph gear can be operated from the right or left and from any part of the boat. Four stock sizes are made, ranging

FRANKLIN

Does it pay to own a heavy automobile?

Figure it out. Get the weights of a dozen of the best-known 5-passenger touring-cars. See them weighed yourself. The 5-passenger Franklin Type D weighs under 2200 pounds. The other makes weigh on the average a third more.

That means they use up a third more horse-power, a third more gasoline, and a third more tires, doing the same work as Type D. More gasoline than that, because the air-cooled Franklin engine gets more power out of the gasoline.

Another thing: There is less strain on Type D—or any Franklin. The Franklin does not jolt and rack itself. It lasts longer. It has 4 full-elliptic springs and a laminated wood frame. It has no water-cooling weight and complication. It is easy to ride in; easy to handle, strong, and safe. You can use all the power. The Franklin carries the same load on American roads further in a day than any heavy automobile.

The price of Type D is $2850, yet in six months it costs less than a heavy automobile bought at a considerably lower price.

The Franklin Type G family touring car at $1850 and weighing 1600 pounds does more work and costs less to use than any 2000-pound automobile. The 6-cylinder, 7-passenger Franklin Type H costing $4000 weighs only 2600 pounds and is more economical to maintain than the average 5-passenger, 4-cylinder machine.

With a heavy automobile you cannot get the benefit of the excessive operating cost.

Is it good business to pay for useless weight?

Write for the catalogue describing Franklin models.

Hints on Care of Tires

BY WELL-KNOWN MAKERS.

(Continued from page 69, April number.)

The tire manufacturer has had many perplexing problems to solve and for a score of years kept experimenting, changing the quality of the materials used and seeking for better rubber until the present perfected tires resulted. However, much trouble is still experienced and the makers at least have decided that this trouble is directly due to the users and not to tire materials or construction. One trouble breeder has been the enormous weight of the large seven-passenger limousine cars, the limit of the weight of which was probably reached this last season. Manufacturers are now endeavoring to reduce this excessive weight, not only because tire makers objected, but because the popular demand is now for lighter weights and less expensive cars to operate.

The following pertinent suggestions are given by the Goodyear Tire & Rubber Co., Akron, Ohio. The best way to determine the proper tire pressure is to get a good gauge, and inflate the tire with it. But don't stop there; put the gauge on the valve once in a while and find out whether the tire actually carries the proper inflation at all times. This company believes that tires should always be kept pumped up until there is no perceptible depression where the tire touches the ground when the car is without passengers. Remember, however, that a big thick walled tire will show little depression under a heavy load even though the air pressure is too low for safety. Appearances are, therefore, somewhat deceptive. To make absolutely safe, get a good gauge—and use it.

WORN TREADS.

As soon as the tread wears down until the fabric is exposed, the tire should be immediately removed and sent to the factory for retreading. Otherwise the fabric will soon be destroyed and the tire permanently injured in consequence.

When embedded in rubber and not subjected to strains or weakened by bending as above, the fabric used to reinforce the tire will retain its strength indefinitely. As soon, however, as the rubber is removed and moisture from the road is permitted to penetrate, the fabric begins to disintegrate and in an incredibly short time its strength and resistance are gone forever.

Here are a few trite Goodyear warnings: Air costs nothing. Use plenty of it. Avoid curbstones. They are hard on tires. If tire bolts are used, keep them tight. Keep water out of the inside of the case. See that there is plenty of clearance between fender and tire. Never allow the weight of the car to rest on deflated tires, even over night. Don't turn corners at top speed. Make repairs at once—delay is costly. Don't let the car slide down hill. An extra tube will save a lot of time fixing punctures.

CARELESS USE OF CHALK.

With the modern up-to-date tire much less chalk is necessary than with the earlier tires. The insides of the shoes are now comparatively smooth and do not require the inside canvas protectors which were formerly used. An excessive amount of chalk is apt to agglomerate, forming a hard lump which will injure the inner tube. Careless dumping of chalk into the shoe with the expectation of its spreading by rotating the wheel is therefore a bad practice and may result in injury. A better method is to rub the tube with a soft rag that has been dipped into the chalk, getting on sufficient so the inner tube will slip in easily and not adhere to the inner shoe after running. Great care should be taken to prevent any particles of sand from getting into the shoe, as it will cut like a knife and very rapidly spoil the inner tube. Be careful not to carelessly pinch the inner tube, as this is probably next to punctures the most common cause of deflated tires. With the modern detachable rims, however, there is very little excuse for this, the chief danger being pinching under the head of stay bolts. Such an injury is patched in a similar manner to a puncture, care being taken to get a patch large enuf to completely cover the injured part. The edges of the patch should be thoroly chalked to cover the excess cement which may extend beyond the edges of the patch.

Much of the tire trouble can be traced to hurried and careless repairs made on the road. The growing use of the entirely demountable rim is, however, largely correcting this as the spare tire and rim can be instantly slipped into place and the injured tire repaired at leisure.

The Healy Leather Tire Co. give the following good advice in regard to excessive wear on the tires and this applies even if the rubber tread is protected by an extra covering of flexible puncture-proof leather.

"Excessive wear on the tires may be avoided by starting the car as gradually as possible so as to avoid the spinning of the wheels, which grinds away the tires. Equal in importance to this is the application of the brakes in slowing up. They should not be put on too hard so as to cause sliding of the tires. As far as possible, allow the car to slow up gradually before coming to the point where stop is to be made. The brakes should be adjust-

Hosted by Google

cut in a very short time. The front heels should be looked to to see that ey run true, as this is one of the most mmon causes of wear on tires. Overading and speeding a car, while necesry in a great many cases, should be oided as far as possible. The lugs must kept as tight as possible. After the es have been run, the bead works down to place and the lugs become loose, but they are set up tight again they will reain so."

Dr. T. J. Cooper, inventor of the "Fearaught" punctureless, non-collapsible pneuatic tire, says: "The most serious dame done to tires is due to excessive speedg, overloading, stiff clutches, misuse of e brakes, and driving over newly metaled ads with the full power of the engine erating at the road wheels. Such abuses ind off the rubber of the tread faster an many miles of travel. Rusty and arp rims cause much damage. Rims ould be filed smooth and kept well paint or rubbed with a paste containing ench chalk and black lead. Another use of tire deterioration is allowing em to stand unprotected for a long time the strong rays of the sun, which over-

as rubber cuts much more easily wi wet than dry. A tire should never be u after the canvas begins to show throu the rubber tread, but should be sent the manufacturer or repair shop to be paired immediately, and in all cases wh it is possible repaired tires should used on the front wheels, as, they will g better satisfaction."

As cars are now being prepared for road close attention should be given rims and jammed or defective ones placed, as rims are cheaper than ti See that the rims are properly painted have all the small cuts in the tires canized. Carefully roll up separately spare inner tubes with the valve stem the outside of the roll. While pumping one tire don't let the weight of the rest on the other deflated tires, and all means use a gauge and know that y tires are properly inflated.

In conclusion, if the readers have c fully read the tire information here gi and will in any degree follow this adv unquestionably less trouble will be from tires and their term of active serv will be materially lengthened.

he Smith One-Lock Adjustable Reamer

The Smith Adjustable Reamer.

It can be accurately adjusted to any size thin its range in a few seconds without grinding the blades. This results in a ving of from one-half to two hours where ades would have to be ground to be all ought to the same size. As adjustment n only be made with a special socket

or reamer, a cam bolt and a lock nut. shell or body is formed of one piece, bo and slotted to receive the cam bolt blades. The cam bolt has an angu sleeve to engage and lock the blades their adjusted position. The blades held rigidly against the hardened cam faces of the bolt by angular lugs engag the cam bolt sleeve. The blades be seated in the ends of the shell slots, also firmly supported laterally by the cial form of the shell.

Adjustment of the blades is from the tre outward or inward, effected by a rot movement of the cam bolt. The blades main longitudinally fixed, leaving the fr of the reamer free from obstructions reaming to the bottom of the hole. adjusting parts are housed within the b of the reamer, being thereby protec from grit or injury. The outer body of reamer is deeply fluted, leaving plenty chip room.

For compensation and alignment, reamer is made a floating fit on the ar To give strong driving contact, the s is left full diameter at the back All parts are interchangeable.

Stilson Six

One of the recent entrants into the motor car industry is the Stilson Motor Car Co., Pittsfield, Mass., U. S. A., builder of the "Stilson Six," one chassis only being made, but fitted with various types of bodies giving several models. This machine is high grade, both in material and workmanship and contains many minor deviations from the usual practices, all of which, however, tend toward comfort and reliability. The location of the maker in the hills of western Massachusetts gives exceptional opportunity for trying out the car on strenuous work, and as each and every machine is demonstrated to be satisfactory under these adverse conditions it is but natural to suppose that the "Stilson Six" will make light work of the less trying road conditions which are usually met.

CHASSIS SPECIFICATIONS.

The motor is of the six-cylinder type, cylinders cast separately with integral water jackets. The bore is 4 11-16 ins. and the stroke 5½, the engine being rated as 50-60 H. P. The valves are located on opposite sides, are interchangeable, mechanically operated and as noiseless as it is possible to make a valve. Ignition is by high tension magneto and also as a reserve a full set of coils and storage batteries are installed. A special oiling system is used which will be described later. The wheels are of the usual artillery type, second growth hickory, 34 or 36 ins. in diameter and are fitted with clincher or Marsh quick detachable rims. 4 in. front tires and 4½ in. rear of any American make, constitute the tire equipment. The wheel base is 123 ins., tread standard.

Drive is by means of shaft and bevel gears and a three speed and one reverse sliding gear of selective type. A double set of brakes of internal and external type are fitted to the rear wheels. The standard body is of side entrance tonneau touring type, seating seven passengers and is ironed for top. The car with this body completely equipped weighs 3225 lbs. and sells for $4500. The equipment consists of two large acetylene headlights, B. & L. mirrors, generator, two square oil side lamps, oil rear lamp, whistle operated by foot lever, footrest, robe rail, pump, jack and full kit of tools. With limousine body the car sells for $5500.

THE POWER PLANT.

The motor, which is the vital part of any self-propelled vehicle, is a very compact, neat looking and powerful piece of mechanism, the very neat appearance being due largely to the fact that the multiplicity of small pipes, wires and linkages have been localized and carried thru conduits or other means which protect these small parts and keep them from cluttering up the engine. The six 4 11-16x5½ in. cylinders develop 60 H. P. at 1100 R. P. M. The base of the engine is an aluminum casting which forms the pan and also the engine support and rests on the sub frame, which is of the usual channel section prest steel, the narrow space between this sub frame and the main frame being filled by a thin sheet metal pan so that it is impossible for any road dirt or splash to enter the space underneath the hood. This case is divided in a horizontal plane, the lower half, as usual, forming simply an oil pan with three large hand holes on the under side covered by plates. The main bearings are of babbitt seven in number, and hung from the upper half of the case.

The cylinders are good examples of foundry work with symmetrical valve chambers on opposite sides, well provided with water jacket space, particularly around the exhaust valves. The tops of the valve chambers are fitted with screw plugs with castellated tops and are tapped to receive the spark plugs. The valves are 2 1-16 ins. diameter with 7-16 in. lift and are made with integral heads and stems with large fillets. The usual helical springs are used for closing them, the lower end of the springs resting on a flanged washer, the lip of which prevents an ordinary straight pin placed thru the stem of the valve from coming out of place, thus retaining the springs. The valve lifting rods are fitted at their lower ends with 1 1-16 in. diameter hardened steel rollers ½ in. wide, the rollers themselves working in slots in the valve lifting rod housings and thus preventing the lifting rods from turning. The guide housings are of bronze and are held by two cap screws each to suitable bosses on the crank-case, while the lifting rods, contrary to usual practice, are made of Shelby steel tubing, pack hardened and ground.

A neat arrangement for excluding dirt consists in making the top of the valve lifting rod guides in the form of inverted cup-shaped caps which move up and down with the lifting rods and are a sliding fit over the outside of the housings. The cams are of special contour fastened to the shaft by means of two pins each. The cam shaft runs in four bearings which are arranged as follows: a large bearing is placed at each end and two others are placed between the two sets of cams so that each end of each bearing comes outside of a cam and supports the same. The six throw crank shaft is cut from a solid bar of chrome nickel steel with a six-inch integral flange at its rear end, which by means of eight ⅝-in. cap screws and two dowel pins carries the 16-inch, 60 lb. flywheel. The connecting rods are H-section drop forgings, the lower cap being held by four Vanadium steel thru bolts with two

Hosted by Google

; of bronze. The crank pin bearing is of bbitt of liberal dimensions. The wrist is of Shelby steel tubing, pack hard-ed and ground and prevented from side p by two set screws which pass thru e piston bosses into the hollow inside the pin and have a bent wire placed thru les in their inner ends to prevent them m coming out, this method being one of e simplest and most effective known. e pistons are of standard design, good ality, of gray iron and fitted with 4 rings ove the pin.

The gears at the forward end of the en-ne are enclosed and packed in grease, e crank shaft gear being of steel while e cam shaft gears are a combination of onze and fibre for quiet running. A gitudinal shaft on the left side of the

and of varying cross section to correspo with the volume of the exhaust gases be disposed of. The intake manifold peculiar, being a special patent of M Stilson and is so designed that it claimed the volume of gas conveyed each of the six cylinders is equal. T general layout of this intake can be se in the accompanying photograph of t right side of the engine. The design such as to minimize the effects of iner of the body of gas in the pipe, this bei accomplished by making the distance each of the six intake chambers equal.

A 23-gallon gasoline tank is suspend from the rear of the frame and suppl by pressure from the exhaust pipe th the usual reducing valve placed on t dash under the hood. About ten miles

ering gear is the fact that all thrust is ken on ball bearings.

grade and the workmanship exceptiona good. The finish is what it should be o high grade machine, heavy fenders webb to the frame being used and well support to the running boards. Trunk racks, ro rails, foot rests and other minor neces ties of touring are arranged for. The is said to be extremely easy riding and specially good hill climber and one of t chief points claimed for it is the fact th the engine is so smooth running and w balanced that it is impossible for perso sitting in the tonneau to feel any vib tions from it or hear it. The muffler is special design and extremely efficient, tirely silencing the exhaust so that the is practically noiseless.

A new form of clutch which has recen been patented and here described and lustrated for the first time will be used the new cars.

The object of this device is to autom cally insure an easy starting of the independent of the operator, and it claimed that it serves very much the sa purpose as a change of gears in the sta ing operation, and that there is no seri heating of the oil under such conditions

Crown Motor Carriage

The Crown Motor Vehicle Company, th factories at Amesbury and Boston, ss., and Boston office at 23 Motor Mart, rk Square, has just placed upon the mar- a new carriage type automobile, which s several distinctive features. This new hicle owes its origin to a combination of erests. Mr. W. A. Shafer, well known the New England distributer of the de cars, is the president of the com- ny, and Mr. J. R. Graves, president of Graves & Congdon Company, of Ames- ry, well known, high grade automobile ly designers and builders, is the secre- y of the company, and Mr. Frank Dodge, chanical engineer and designer of auto- tic machinery, is the treasurer.

The bodies for the new vehicles are built the Amesbury factory, while the engine d other mechanism are constructed in ston.

ENERAL ARRANGEMENT AND SPECI- FICATIONS.

tected from road dirt and also provid protection for the wearing apparel of la operators.

Tiller steering is employed, the lever ing placed in front of the right-hand oc pant. The motor is of the two-cylinder, posed, air-cooled type, having a bore 4⅜ inches, stroke 4 inches, and devel 12 horse-power actual. All parts of t motor, which is of special design, are terchangeable, and as it is located in rear of the body and not under the seat is very accessible. It is mounted on three-point suspension, and drive is means of a shaft running forward to a ja shaft carried on an aluminum cross me ber attached to the side frame memb of the carriage, and at the centre of t cross member an integral aluminum ho ing carries the bevel gear pinion and s gear differential. The usual sprockets fitted at the ends of the jack shaft drive to the rear wheel sprockets by me

Digitized by Google

during easy riding qualities. The wheel
base is 74 inches, the wheels being of spe-
cial design, using the Sarven patent, and
30 inches in diameter, fitted with 1⅛-inch
solid rubber tires, and are mounted on
large ball bearings. The transmission is
of special type, and will be described later.
It provides two speeds forward, and one
reverse, operated by an inconspicuous hand
lever conveniently located at the driver's
right, and by two foot levers.

THE MOTOR.

The motor, which is comparatively light
in weight and fitted with ample cooling
ribs, has all mechanically operated valves,
which are interchangeable. Cooling is as-
sisted by fan blades placed on the peri-
phery of the fly-wheel. The method of sus-
pension consists of two points on the en-
gine proper, suitable brackets being ar-
ranged on the cylinder ends and bolted to

effectively preventing it from [illegible]
or coming out. The main bearings are
of white brass, 2½ inches in length
1⅝ inches in diameter. The crank
is a high carbon drop forging, the
wheel being keyed on a taper seat on
forward end of the engine shaft, a
longation of which enters a two-s
planetary change gear, and is then
tended into the bevel gear housing on
channel section aluminum jack shaft
member support. The pistons are
gray iron, provided with three diago
split and pinned rings placed above
wrist pin.

A Schebler carburetor is used, an
placed at the rear, slightly below the
gine, in an accessible position, this
rangement always insuring a sufficien
gasoline in hill climbing, as the four-ga
galvanized iron fuel tank is forward o

LUBRICATION.

cells are claimed to be unaffected by water, and the terminals are so arranged that they cannot jar loose. A single vibrating coil is used, but arrangements are made, as there is an extra spark plug hole in each cylinder, for using a double ignition system, if desired.

THE CHANGE GEAR.

The change speed mechanism, as before stated, provides two speeds forward and reverse. It consists of a two-speed spur gear planetary arranged on the engine shaft immediately forward of the fly-wheel. The low speed is obtained by means of a contracting band, while the high speed is provided by means of a metal plate clutch fitted with cork inserts, the entire device then rotating as one piece and simply adding its weight to that of the fly-wheel. The continuation of the driving shaft is carried forward into the bevel gear housing. At this point, two bevel gears on the ends of the live jack shafts mesh with the main bevel pinion. At one side is a spur gear differential, and at the centre of the jack shaft is a movable dog clutch, which is held in contact with the left bevel gear at all times by means of a spring, thus providing a forward drive, the speed being low or high according to the planetary. However, for reverse a slight pressure on the lever moves this dog clutch to the right, engaging the other bevel gear, which ordinarily runs free on the jack shaft, thus giving a reverse drive. As soon as the lever pressure is relieved, the clutch immediately engages, so as to drive the car forward. The reduction in chains to the rear wheels is 4 to 1 to 8 to 1, the rear sprockets being rigidly fixed to the wheels by means of band clamps, which encircle every other one of the spokes. The sprockets are so arranged that they can be easily replaced, and all sprockets will be made interchangeable. Adjustable length radius rods extend from the spiders which hold the brake shoe pivots to the outer ends of the jack shaft hangers. The jack shaft and hanger are arranged to slide forward or backward on the under side of the flat surface of the angle steel frame, and can be rigidly clamped in any position, thus providing a means of adjusting the chains. A square section slip is provided in the main driving shaft to allow of this motion.

CONTROL.

The control is extremely simple, consisting of a single side lever at the right of the seat, the forward position of which controls the high speed, and one pull backward disconnects the high speed clutch, and pushing the lever further backward produces the reverse. The right foot lever applies the internal expanding leather-lined brakes in the rear hub drums, which are in reality a part of the sprocket assembly. These brakes are cam expanded. The other foot pedal, which is to be operated by the left foot, controls the low speed forward by means of a contracting band on the planetary. A small spark and throttle lever projects slightly above the arm of the right end of the seat, so as to be conveniently operated by the thumb and finger. These are rigidly retained in position, but have a very small arc of movement at the upper end, so that they are easily operated by one hand. Steering is by means of a tiller, which is hinged at a point on the floor boards approximately in front of the driver. In the end of the handle, conveniently located for operation by means of the driver's finger, is an electric button for ringing the bell.

RUNNING GEAR.

The axles are a combination of wood and steel of the fan-tailed type, well known in carriage construction. The middle portion of these axles is spread and narrowed toward the ends. On top of this metal axle a wood bed is clamped, making a very light but rigid axle construction. Wood reaches are used, well braced at the ends. The yokes at the ends of the front axle are integral with it, and so arranged that the steering pivots are at a point very close to the centre plane of the wheels, making the steering easy. The cross connecting link is back of the front axle. The connections to the lower end of the steering tiller are by means of levers, no racks, bevel or worm gearing being used.

The full elliptic cross springs are perched on top of the axles, and rigidly held with solid double clips, and the body is supported at both ends from a cross hanger, each end of which is flattened out into a long support bolted to the under side of the angle steel side frame members, while the centre of this cross support is clipped to the centre of the cross spring. The front and rear supports are alike, except that the one in the rear is somewhat heavier, as the engine weight is carried mainly in this place.

BODY AND EQUIPMENT.

The body is Crown special type, very light in appearance, and with a carriage finish. The seat is extra wide, and very roomy, so that two grown persons and a child can be comfortably accommodated. The dash is of the regulation patent leather buggy type, without devices of any kind.

The equipment consists of top, two oil side lamps, bell and battery, no tire pump or tire repair outfit being necessary. The vehicle complete weighs about 800 pounds. Fully equipped and ready for the road, the price is $775, f. o. b. Boston, Mass.

this bracket being supported on the front of the forward cylinder.

The wheel base of this car is 109 in., tread standard. Bodies will be supplied to suit the purchaser. The equipment consists of oil lamps, mats, horn, tools, tire, repair kit, etc., but does not include a top or headlights. The price of this machine, with either a metal 5-passenger touring car body or a runabout body, fitted with single rumble seat at the rear on a tool chest, is $2,000.

Remarkable Test of Interchangeability

What is probably the most severe test of standardization of the parts of a motor car were recently carried out by the Royal Automobile Club of London, Eng., on three Cadillac runabouts. The performance was carried out at the instance of the Anglo-American Motor Car Co., of London, British agents for the Cadillac product, to establish beyond a question the absolute standardization of the parts of these cars.

Three 10-horse power runabouts were selected at random from stock by the mechanical committee of the R. A. C. These cars were run under observation to the Brooklands track and there driven for

Parts of the three Cadillac Cars indiscriminately mixed.

fifty miles. The cars were then taken to pieces under the eyes of R. A. C. inspectors, the parts mixed indiscriminately, some withdrawn, and new ones from stock ordered to take their places, divided into three piles, and from these three new cars were assembled. On re-erection, not only did the motors start on the first turn of the handle, but all three machines successfully completed 500 miles on the Brooklands track at an average speed of 34

eral Superintendent of the Motorcar pany of Detroit, died at his home, Commonwealth Ave., that City, Mo morning, April 6th, after a week's s gle with pneumonia. Mr. Carter wa inventor of the friction drive for use automobile and the Carter car bear name.

Byron J. Carter, Vice-President and General Super ent of the Motorcar Co., who died April 6th, week's illness with pneumonia. Mr. Carter is with the introduction of the friction drive for mobiles.

He was actively identified with th dustry from its inception in Michiga ginning his experiments in 1887. He two machines and organized the Ja Automobile Company to build this In 1903 he resigned as General Manag work out his ideas on friction dr which resulted in the formation o Motorcar Company. He leaves a wif three children to mourn his death.

Salt Lake City Building Trac

Work has already begun on a big ci mile and a half automobile track a Lake City. The new track will be lo on the wide sandy shores southeast Saltan Beach and will be construct gravel and oiled shale. The track w 60 feet wide on the turns and 75 fe the straight-a-ways. At intervals o feet around the track huge reflector tric arc lights will be placed, making racing possible.

On November 20th, 1907, Stevens

s has been well known in the trade some months, Mr. Hiram Percy Maxim Mr. T. W. Goodridge have been en- ed in the production of a new electric which was to have entirely new fea- s. This car has just made its appear- e, and in several details it is a strik- departure from conventional electric iage designs.

e first thing which attracts one's at- ion in the construction is the surpris- freedom from underneath mechanism. s effect is the result of using a worm wheel drive in place of the customary on and gear and sprocket and chain, in this respect the car marks a new arture in electric vehicles. All elec- s on the market to-day use either pin- and gear drive, or a combination of rs and chains, which makes the reduc- double.

WORM DRIVE.

uch has been written lately upon the at advantages which the worm drive sesses for the transmission of a motor

structors to the worm and worm whe drive has heretofore been the question loss, due to the working action being e tirely a sliding one instead of approximat ly a rolling one, as in the case of gear The irreversible feature of the commo worm has also been a hindrance to its f vorable consideration. With the ordinar type of worm and wheel these objection unquestionably hold, and the drive woul not be at all practical on a motor car, bu the makers of this car claim that all thes objections have been entirely overcome, a shown by the working of the car. It claimed the car moves so easily that it wi start of itself under the action of even slight wind or down grade unless one the two brakes are set.

Fig. 1. The New Maxim-Goodridge Electric. Designer, H. P. Maxim driving. This new vehicle has many nctive constructions. The control is at the left side. The entire rear axle construction is unique, a worm drive g employed. The under side of the car is noticeably free from mechanism and the entire power plant and eries are carried on springs, there being no dead weight on the axles. The 30 cells of 11 P. V. Exide forming battery are all carried under the hood at the front in a similar manner to the power plant of a gasoline car. el base 84 inches, maximum speed 18 miles per hour, price $1800.00

but the Maxim-Goodridge vehicle ms to be the first electric to break ugh the conventions and adopt it. The nting of the worm drive is interest- as will be seen from Fig. 2. The elec- motor has its armature shaft prolonged the worm mounted directly upon it. worm wheel is supported in a separate sing which is divided vertically, and at- ed directly to the end of the motor. stub shafts of the differential project ugh this housing, as shown. This drive

In driving, it is said, the tests of pow consumption give positive proof of the lo point to which the losses have been r duced, and this low friction means slo wear, and on this point the makers sta that there is the best reason to belie that the life of the worm and wheel wi be indefinite. It is completely housed from dust and mud, runs continuously oil, and requires absolutely no adjustmen The worm is made of steel and harden and the worm shaft and motor armatu

ifferential stubs with the rear wheel hubs.

Fig. 2. Rear view of Maxim-Goodridge electric showing rear axle construction. The weight of the carriage is irely supported by the dropped solid axle and not by driving mechanism. The transmission is by worm l wheel driving thru universal joint-shafts to the wheels. e driving mechanism is supported on the carriage ings. Electric side and tail lights are used. For cial construction see text.

p-and-down motion of the body is allowed r by the universal joints. For average ads these shafts are, approximately, in straight line, and only on jounces and ecoils is there any motion in the joints. he rear axle is offset to allow for the

earing of the universal joints, and except

pneumatics. In this new car it would s
that the chances of success with s
tires would be greatly augmented. In
ing in the car equipt with solid rubber t
the only difference noticed is that a sl

Fig. 4. Control levers of Maxim and Goodridge el car, showing the controller handle mounted on the ing post below the steering lever in which positi does not take up any seat room as when placed a side of the seat. Steering is from the left side.

noise is heard when crossing street tracks and similar sharp bumps.

The riding qualities, however, are no all different from what they would with pneumatics, and aside from hear it is doubtful if one could tell what l of tires were fitted. This is the re of the long springs, and the loading of the weight where it is supported by springs.

Another of the striking features of unique vehicle is the way the batteries carried. There are 30 cells of 11PV Ex and all of them are placed under a f bonnet, the same as the power plant gasoline machine. The makers do claim that this arrangement is followed cause it is a feature of approved gaso car design, but because it is the only in which the weight can be carried equ upon both front and rear axles. In r types of electric cars, where batteries carried at each end, the rear tires are quired to carry some 60 per cent. of total weight, and at the same time do the driving. In the Maxim-Goodridge the weight is just 35 lbs. more on the wheels when two passengers are in seat, than is the weight on the f wheels. This is claimed to have an

Hosted by Google

ndle is mounted upon the steering post st below the steering lever, as shown in e cut. This handle is stated to be more nvenient to operate than the convenonal style side lever, and entirely avoids e mutilation of the cushion and the occaonal dangerous catching of garments.

There are two brakes fitted, both conolled by foot levers projecting upwards rough the floor. One brake operates up- the rear hubs and one upon the motor aft. The wheel base is especially long, ing 84 inches, which materially adds to e ease of riding. The diameter of all ur wheels is 32 inches, and the tires

dium between the runabout and the to ing car, combining the smartness and light weight of the former with the ex seating capacity of the latter.

To meet this demand the Studeba Company has introduced its "Suburba This is a thirty-horse power car with chassis identical with that of Models A a H, but having seating capacity for f persons. The body of the car is consid ably shorter than the body of a regu touring car of the same horse power, the car presents an exceedingly smart pearance as shown by the accompany photograph.

The Studebaker Model A 30 H. P. "Suburban" Car. This machine has a regular chassis as described on p 2, March, 1908, issue of the Journal, but the body is special.

ed, in either solid or pneumatic, is 3½ ches.

The motor is a General Electric, and the ntrol is by means of the new style, unterrupted torque, multiple-series conoller, giving five speeds ahead and three verse. The maximum speed is 18 miles r hour. The mileage on one charge of e battery, with either solid or pneumatic res, is fifty on ordinary road surfaces, d, of course, much more on good city vement. The weight of the car is 2,100 s. with the battery mentioned, and corspondingly less with smaller battery and mpler body. The chassis is entirely selfntained, and any type of body is supied for especial purposes, although the andard is the Victoria-Phaeton shown in e illustration. The price is $1,800.00.

Japan is fast catching up to the Western rld in civilization. In regard to the recognin of the supremacy of the automobile in

The body is peculiar for an automob as it is an adaptation of the type of b used on light wagons and heavy road b gies. The rear seat is removable and ries a top. Under it is a very large ca ing space and back of it a luggage ham is fitted. The rig presents a very n appearance.

The receivers' report covering th transactions for the Pope Mfg. Co. dur the month of March shows a big incre in the cash balance. The total recei for the month amounted to $179,614 which includes $166,756.58 from sa made by receivers. The cash disbu ments for the month amounted to $1 429.11.

The decision made by Judge Buffing in the lower court in favor of the defe ants in the case of the G & J Tire Co. the Pennsylvania Rubber Co., which volved the G & J patents on the clinc

iladelphia, Pa., have placed a new type plug upon the market. It is made from ¼ in. square brass rod, turned to fit any e tap in the cylinder, with apertures on e sides for the electrodes and on top for mica window. The electrodes and mica e held in place with supplemental caps keepers bolted to the body of the plug.

The plug is double, or in other words, has o independent electrodes which are inlated from the body of the plug, and so from the engine. Therefore, the plug ay be operated from a groundless circuit, one electrode may be grounded and the ug worked from the general system as w used.

The plug can also be run from two or ree different sources of electricity, procing the high tension or jump spark, one ectrode being entirely independent from e other; when fitted for this service ere is a slight change made in the elecode washers to meet the altered condions.

e Naylor Spark Plug, operated in the ordinary way or on the groundless system.

The electrodes are entirely different om any upon the market at present, havg a flat disk-like surface that gives off any sparks from different places, thus t only tending to keep the surface clean, t allowing of many different paths for e spark to jump.

The electrodes may be cleaned by slackg the adjusting nuts on either one and essing one electrode against the other, d twisting or moving it back and forth the other.

The purpose of the mica window is to rmit observations being made as to hether the spark is actually working hile the plug is in the engine; it also disoses the fact as to whether there is an ition and thus clearly determine wheth-

the electrodes, thus not only cleaning th if they require it, but giving certain ig tion at starting.

The body of the plug is hollow and electrodes are further away from the plosion chamber than usual. This is no detriment as popularly supposed, bu decided advantage as the mixture in t chamber when fired shoots out a fla which in turn fires the whole mixture the cylinder, thus causing a stronger pulse to be given to the piston.

After the plugs have been used seve days, if they are removed and taken ap examination will show that the lubricat as well as the mixture may have been tirely different in the various cylind This will be shown by the nature of fouling or deposit on the interior of plug. One or two will probably show bare discoloration, while another may quite blackened, showing a surplus of inder lubrication as well as a rich smoky mixture in that one. Moisture t a small jacket leakage will also show a slight deposit of rust on the outside ameter of the electrodes, the face be kept clean by the spark as before m tioned. The color of the electrodes also show when one cylinder has ho combustion than another.

The plug will spark on any source electricity as now used on automobiles launches. When it is used on the grou less system, it saves battery power gives a stronger spark. It is also ea on magnetos and is said to reduce amount of fuel used per horse-pow These plugs sell for $2.50 each.

Monarch Motor Mfg. Co., of Chic Ill., has leased commodious quarters 1592-1600 North Halsted street, into wh it has moved, from Kinzie & Cass stre Considerable new machinery is be added and facilities increased genera Pattern and drafting departments h been added and a department for doing eral machine work on contract. The "Atwater-Kent" Gasoline Gauge

The Atwater-Kent Mfg. Co., of 42 Nor Sixth street, Philadelphia, Pa., w known manufacturers of the Atwater-Ke generator and ignition sy tem, have just brought o a gasoline measure as show by the accompanying cu which they offer to se gratis to any automobi owner on request. T measure is essentially a in. boxwood scale, which graduated into inches, and to be used to determine t depth of gasoline in t tank. It is shellacked make it proof against a tion by the gasoline, and t black strip is given a gas line-proof dull finish, whi resembles the surface of blackboard, and like a blac board turns glossy when w with gasoline, thus showi clearly the height of t gasoline in the tank.

The "Klaxon"

The "Klaxon" is a new type of alarm for motor cars and its name is derived from the Greek word "klaxos" meaning a "roarer." It is the invention of Mr. Miller Reese Hutchison, Madison Ave., N. Y. City, and is manufactured by Lovell-McConnell Mfg. Co. of Newark, N. J., either of whom are prepared to promptly fill orders. This alarm consists of only two parts, a Vanadium steel diaphragm, and a cam-wheel. As this cam wheel is revolved the cams strike against a hardened steel anvil affixed to the centre of a diaphragm, causing the diaphragm to vibrate violently and produce a sound, which besides being distinctive has tremendous volume and can be heard at a great distance. The intensity of sound, however, is regulated at will and covers the entire range from a low "growl" to a piercing "shriek."

The mechanically driven, Type L "Klaxon."

The "Klaxson" is put out in two forms, one for mechanical and the other for electrical drive. The mechanical drive outfit includes the "Klaxon" complete in a highly ornamented polished brass case which may be attached to either side of the dash, a flexible shaft connected to the cam wheel (or rotor) of the "Klaxon" and a friction wheel that is grooved on its periphery, the apexes of the ridges formed by the grooves being knurled so that the wheel is sure of gripping the periphery of the fly-wheel. Any grease or other substance that is on the fly-wheel is forced up into the grooves, as the knurled edges cut thru the film of grease, oil, etc., and take hold without slippage. The friction wheel is mounted on a substantial bracket screwed to the dash at any convenient point. A brass chain leads from an arm of this bracket to a point on the steering column convenient to the hand of the operator. A pull of the chain brings the small friction wheel into contact with the fly-wheel and causes the "Klaxson" to "roar" or "growl" according to the pull given the chain. When the chain is released the friction wheel flies back against a brake which instantly stops its revolution.

Type S Klaxon, showing diaphragm and cam wheel.

The electrically driven "Klaxon" includes a small but powerful motor which is operated from the ignition current or from a separate battery. It is actuated by a push button located on the steering wheel, or by a chain if desired.

Two styles of the "Klaxon" are made; Type S for use in cities and immediate suburbs and Type L which throws the sound far ahead and is especially suited for country use or on motor boats. Type S, either type of drive, lists at $35 and Type L at $40.

The Goodyear Tire and Rubber Company, Akron, Ohio, is running a night force in its automobile tire department to keep up with orders, which surely is an impressive indication of the condition of the tire branch of the automobile business as well as of generally improved conditions.

Dow Portable Electric Company of Braintree, Mass., makers of ignition apparatus, have arranged to sell their entire output thru the Geo. Q. Hill Company of Boston, Mass. There is no change in their local representatives, however, W. J. Connell, 36 Columbus Ave., Boston, continuing as New England representative, Factory Sales Corporation, 235 Randolph St., Chicago, western representative and L. H. & B. J. Bill, 132 Valencia street, San Francisco, Pacific coast representative. Mr. Dow, with whom Mr. Theodore M. Muller, graduate of Stuttgart University is now associated, will devote his entire attention to the manufacture of the Dow line. Mr. Muller was until recently with Robert Bosch of Stuttgart, Germany.

Trade Printed Matter

A strong piece of advertising was recently sent out by The Semi-Dry Battery Co., of Harrison, N. J., in the form of a folder, one page of which is in the form of a postal, intended to be returned to the company by prospective purchasers for the purpose of giving the company necessary information to enable it to properly meet the customer's requirements. The rest of the folder contains convincing arguments regarding the merits of Dunn Semi-Dry Cells and explaining the reasons why certain information, such as type of ignition, make of coil, type of engine, etc., is necessary to enable the manufacturer to furnish exactly the right battery for any particular case.

Pope-Toledo 1908 Cars, made at the Toledo, Ohio, plant of the Pope Motor Car Co., are very handsomely illustrated and well described in an elegant catalog which recently came from the press of The B. F. Wade & Sons Co. Double page illustrations, in three colors, beautifully blended, of the complete cars are given, while smaller but none the less handsome illustrations are shown of the chassis and parts. The brown cover is beautifully decorated in red, blue and gold, and is bound to the book by a silk cord.

An exceptionally neat announcement was recently sent out by Graves & Congdon Co., of Amesbury, Mass. It is in the form of a wedding or other engraved invitation, the lettering being in old English, and invites the recipient to examine the company's work in closed body building at the Boston Show.

Matheson Motor Car Co., Wilkes-Barre, Pa., make plain in their 1908 catalog their intention to build cars for the best trade, and consistent with this policy, has issued a very high grade catalog to advertise the Matheson car. This catalog is elegant in the extreme, all decorations, colors, etc., showing very refined taste, while the reading matter is at once interesting, practical and convincing. Accompanying the catalog is a good sized pamphlet containing technical opinions of experts and editors which are compared with features of Matheson design. Testimonials of satisfied users are also given, the contents of this pamphlet constituting a mass of technical and lay opinions as evidence of the correctness of Matheson design.

The latest catalog of Cullman Wheel Co., 1022-26 Greenwood Terrace, Chicago, Ill., contains descriptions of several new products, notably detachable sprockets for motor buggies and new differentials for both light and heavy cars. Besides the Cullman Co.'s own products, lines of chains, etc., handled by this company are also shown. This catalog contains 48 pages and cover.

We are in receipt of a new and attractive booklet issued by the New York Gear Works, 56 Greenpoint Avenue, Brooklyn, N. Y., sole manufacturers of the Ball improved reverse gear for motor boats. Particular attention is called to the clutch, which is one of the main features of the Ball reverse gear, and its simplicity of construction is strikingly shown. There is also a valuable table of dimensions, giving weight and prices of the different size gears. The booklet has an embossed cover of unique design, and presents a very fine half-tone of the Ball reverse gear of the latest type.

A neat little brochure has been issued by Putnam Motor Mfg. Co., of Springfield, Mass., descriptive of Putnam 4-cycle marine, automobile and cycle motors, which are made in various sizes and types. While the descriptive matter is brief, it is to the point, and quite a number of illustrations liven up the pages, each of which contains a neat two-line border in red.

1908 customers' and trade price lists of Goodyear automobile tires and accessories have been issued by the Goodyear Tire & Rubber Co., Akron, Ohio, in the form of small booklets, 3½ by 6 in., and containing 16 pages each. To avoid confusion the two booklets each have different colored covers.

"Faith and Its Realization" is the title of a very attractive book of 24 pages and cover recently published by Maxwell-Briscoe Motor Co., of Tarrytown, N. Y., containing an account of the beginnings of their new factory at New Castle, Indiana, and including a speech delivered by Vice-President Fairbanks at the laying of the corner-stone of the new factory.

The North German Lloyd Steamship Co., Oelrichs & Co., agents, 5 Greenwich st., New York City, have made special arrangements for handling motor cars for tourists, and have published a booklet entitled "How to Ship an Automobile Abroad," in which is explained their very convenient and inexpensive method of handling motor cars on their steamships. While the service is intended primarily for patrons of the North German Lloyd Lines, Oelrich & Co.'s forwarding department will attend to shipments on other lines as well.

"British Highways and Byways from a Motor Car," a beautiful volume of travel, thoroughly covering the town and country roads of England which are available for motoring, has just been issued by L. C. Page & Co., of Boston. The author, Thomas D. Murphy, details in a most interesting way his experiences in old England at the wheel of his Winton Model C.

For the benefit of the "show me" class of persons, Supplementary Spiral Spring Co., of St. Louis, Mo., have issued a brochure of testimonials under the title "Missouri Proof," containing a large number of very strong letters from users of "Supplementary" springs, setting forth the great satisfaction given by these shock absorbing devices The text is mostly in black, but important statements are underlined in red, and brief quotations are also in red, making the pages both attractive and readable.

The Hess-Bright Mfg. Co., Philadelphia, are sending to car makers and other parties interested in anti-friction bearings sheets containing principles of application, practical examples and data relative to the use of Hess-Bright ball bearings. The sheets measure 9 by 12 in., and are punched for tying in a binder, which will be furnished when asked for.

"The Wise Man's School is the Experience of Others" says the Mott Clincher Tire & Rubber Co., of Akron, Ohio, in a four-page folder issued to call attention to the good points of Mott tires for motor cars. The most prominent feature of this folder is a chart containing curves, indicating, it is stated, the results of tests of pneumatic and solid tires to ascertain the mileage obtainable on one charge of a battery with different makes and types of tires. The Mott shows up well on the chart, having run the car 91 miles at an average speed of 18½ miles per hour.

Nyberg Automobile Works, 2437-39 Michigan ave., Chicago, Ill., make a specialty of buying, overhauling and selling second-hand cars, and they publish catalogs from time to time, listing the cars on hand for sale. One of these catalogs before us contains illustrations and specifications of over 50 cars, testimonial letters from satisfied patrons, an explanation of Nyberg methods and a number of newspaper comments on the unique business of the Nyberg Company.

A unique but pleasing plan has been followed in the make-up of the 1908 catalog of Jackson Cars made by Jackson Automobile Co., Jackson, Mich. The general matter is not given in one lump, followed by specific descriptive matter as is customary. One page of introduction, facing a page colored illustration of a Jackson Car in pastoral scenery, is followed immediately by a page cut of Model C, opposite which appear the specifications of this car preceeded by a paragraph of general matter. Thus the general arguments and information is broken up and distributed over a number of pages in conjunction with specifications of different Jackson models. On the top of each reading page appears an outdoor scene in a delicate blue and a blue border encloses each page. The contents of this catalog are presented in conservative language which, by its lack of bombastic claims, has an air of sincerity that carries conviction. The general excellence and fine style of the catalog are also strong points in its favor.

A new section of the Interstate Automobile Tourists' Guide, published by F. S. Blanchard Co., of Worcester, Mass., has lately appeared. This section is number 3 and covers New England. It contains a gazetteer of cities, towns and villages, information regarding touring routes, automobile stations, hotels, selling agents, and repairers thruout this section. The touring routes are all indexed alphabetically under the names of the cities and towns from which the various routes radiate. The trunk routes are also fully indexed and reference numbers given to the touring routes so that any particular route is easily found. Under the heading of Tourists' Guide, a larger amount of information regarding each city, town and village is given in regard to facilities for charging and repairing, post offices, telegraph offices, express companies, population and similar data. Not the least important part of the publication is a large number of advertisements of hotel keepers, dealers in motor car supplies, etc. The price of the book is $2.

The Neustadt Automobile & Supply Co., St. Louis, Mo. have issued for 1908 a 188-page catalogue in a yellow and red cover which lists a complete and very extensive line of parts and supplies. Included in the line of goods shown are a number of their own products, such as axles, frames, bodies, wheels, complete chassis and motor buggy outfits. A prominent feature of the catalog is the complete detailed instructions regarding the sending of orders, shipments, etc., and this idea of completeness is carried out in the descriptive matter and illustrations which fill the book. The Neustadt catalog is therefore an easy catalog to buy from, as complete information is given to enable the reader to know exactly what to get and how to get it.

The Corbin Motor Vehicle Corporation, of New Britain, Conn., has issued a large folder containing illustrations of the Corbin models and their various important component parts, together with illustrations of a number of Corbin cars in various contests which have taken place during the last year, and in which the Corbin has distinguished itself.

As in the past, Charles E. Miller, 97-101 Reade St., N. Y. City, manufacturer, jobber, exporter and importer, has issued for 1908 a very large and comprehensive catalog covering parts, fittings, sundries, etc., sold to the motor car, motor boat and motor cycle trades. This is Miller's tenth annual catalog, and as each successive issue has excelled its predecessor, this latest catalog is ahead of the rest. It has been revised and brought up-to-date so as to include every important accessory on the market and to exclude discontinued lines. Prominence is given a notice in regard to prices, and Mr. Miller calls attention to the fact that while dealers are allowed substantial discounts, his list prices should not be compared to extraordinary discount prices based on inflated values. Besides manufacturing a number of lines which enables him to furnish goods at the lowest possible prices, he maintains a large number of branch stores thruout the country which enable him to do a very large business, and he is therefore in a position to sell at favorable prices.

Now is The Time

This cut illustrates our Quick Detachable Terminal which can be applied to the spark plug cable instantly without tools. It makes perfect contact, cannot jar off, but allows quick disconnection when desired.

to equip your engine with better ignition. The heart of the ignition is the plug, and since gasoline costs money, cheap plugs are dear at any price. The Cleveland Spark Plug is exceedingly well made of selected materials, standing alone in its class as the only plug both practically perfect and scientifically correct. Finishing each part to micrometer gauge renders it gas-tight without the use of springs, taper-joints or packing. The spiral core acts as a powerful condenser, producing an **intensely hot** spark, that shoots a flame right into the mixture resulting in **maximum power** at all times. The action of the spiral core renders the plug absolutely proof against short circuiting since it **positively** prevents the deposit of carbon on the insulation surface.

"It shoots a flame"

Write ***to-day*** for our introductory offer (for a limited time) which gives you ***free*** with each order for spark plugs, your choice of Battery Connectors or Cable Terminals.

Our printed matter contains interesting information on ignition and explains in detail the wonderful action of the "spiral core," the feature of the plug that "shoots a flame."

THE CLEVELAND SPARK PLUG CO.

980 Power Avenue, **CLEVELAND, O.**

The Cleveland Battery Connector is a little wonder and like all our products is extremely well made; easily applied or removed by a twist of the wrist.

contain ample descriptions of a large number of ac-
ories. In order that goods may be easily found in
catalog a very extensive index is given in the front
the book and contains about 450 headings. All the
ling lines of automobile accessories are listed in this
log and the Motor Car Equipment Co. calls attention
he fact that anything on the market not illustrated in
catalog can be furnished on request. This company
shown very good judgment in using good white paper
which the cuts and text matter show up very clearly
distinctly, and besides being of practical advantage,
makes a good impression on the reader. Sending out
oor-looking catalog is like sending out a shabby sales-
to sell goods, and on the other hand, a bright, at-
tive-looking catalog makes a good impression, same as
vell-dressed, affable salesman makes upon a possible
omer. On the back page of the catalog appears a guar-
ee that all goods must be exactly as represented, and
be exchanged in case they turn out different from
t the customer expected. This catalog is a strong piece
advertising matter and is bound to make a good im-
sion upon the recipient.

irelli & Co., 296 Broadway, N. Y. City, have issued
ew price list of Pirelli tires, which has been sent out
older form under date of March 15th.

he Lozier Motor Co., 55th St. and Broadway, N. Y.
, have commenced a publication of a new House Organ,
third in the series of Lozier publications of this char-
r. Their first House Organ was issued by the Lozier
when it was manufacturing Cleveland bicycles, and
called "On the Square." The second in the series
the "Propeller," published in the interest of the
ine Department of the Lozier Company, and this third
se Organ, called "Lozier Logic," is published in the
rest of the automobile business of the Lozier Co. The
number of "Lozier Logic" is a newsy publication of
pages and cover. It is in charge of C. A. Emise, mana-
of their Publicity Department, and will be published
intervals as circumstances demand.

he Joseph Dixon Crucible Co., of Jersey City, N. J.,

LUBRICATION.

)iling is by means of a positive me-
ınical oiler, gear-driven. Leads supply
not only to the engine bearings, but
o to the magneto and pump shaft bear-
s. The cylinders and pistons are sup-
ed by means of the splash. The oiler
self-contained and can be easily re-
ved. It is supported on the engine
nk case. The half-time gears are en-
sed in an oil-tight aluminum case not
en to the splash and are packed in
ase.

'he engine is water-cooled, circulation
ng maintained by a gear-driven pump
bucket type. The radiator is of the
ıeycomb type and a large fan is mount-

steering wheel and an auxiliary pe
is also fitted. A tickler is provided so th
if necesary the carburetor can be flood
without raising the hood. It is claim
the car can be throttled to five miles
the direct drive or speeded up to 50 mi
per hour.

Accessibility is one of the features
the motor design and the pump and m
neto can both be removed without displ
ing the half-time gears. Compression
lief cocks are not fitted, but a device is
arranged that the exhaust valves can
partially lifted giving the same result,
that the motor can be started without
due effort.

IGNITION.

Make and break ignition, the curre
being furnished by Simms-Bosch low t
sion magneto, is used. This system h
been used by the Rainier Co. for seve

THE SELDEN CAR

Model

Five Passenger Touring Car, $2000
Three Passenger Runabout, $2000

AN ATTRACTIVE CAR
AT AN ATTRACTIVE PRICE

SPECIFICATIONS

Engine—4 cylinders $4\frac{1}{4} \times 4\frac{1}{2}$, 28-30 brake horse-power.

Transmission—3 speeds forward and reverse, selective, Timken bearings.

Wheel base—109 inches; tread, standard; clutch, cone leather.

Body—sheet metal, straight line type, roomy and comfortable.

Tires—$32 \times 3\frac{1}{2}$, quick detachable; mak optional.

Frame—pressed steel, $4\frac{3}{4}$ inches deep.

Front axle—single I-beam drop forg ing, ball bearings.

Rear axle—Bevel gear drive, enclose type, roller bearings.

Ignition—synchronized jump spark.

Weight—empty, 2,200 lbs. (actual not catalog.)

CAMERON

3 Speeds Forward. Direct Drive on every Speed. 45 Miles per Hour, and a Wonderful Hill Climber.

Model 9—Four-Cylinder, 16-20 H. P., $1100

WITH our system of transmission (direct on all speeds) we apply to the rear wheels a greater proportion of the power developed by the motor, than any car built. Combining this with our light-weight, elastic spring suspension and large wheels, gives us the smoothest running, most economical 4-passenger car on tires, in the world.

Our air-cooled motor is the result of five years' development, and is perfect in every detail. This car will *average* twenty-five miles to a gallon of gasoline.

We build three other models beside the above, all four-cylinder, and all equipped with our patented transmission.

Model 6—Runabout, $850 **Model 7—Runabout, $935**

Model 8—Roadster (3-passenger), $1050

Cameron Car Company

axle, as in all the other models, is of floating type, the wheel bearings be- mounted on the tubular axle which ries the weight of the car, leaving the ating shafts to transmit the power to wheels by means of dog clutches at the er ends of the wheel hubs. The bear- s are non-adjustable and the axle nuts be screwed on as tight as desired hout in any way affecting the bearings. e differential case is a drop forging tead of the usual casting, and the hous- s are all manganese bronze. The gears propeller shaft are all of nickel steel, driving pinion and its shaft being in- ral, the pinion being supported by a ring on each side of it. Two universal its of new and improved type are used. e front axle is a forging of manganese el of I-section. The front wheel hubs

being prest into shape. It has a 2½-in drop forward of the rear axle. All of t bolts and nuts are cotter pin retained. short aluminum pan extends under t clutch and transmission gear, and as pre ously stated, the motor base forms a p tecting pan.

The wheels are of the very best grad second growth hickory, known as "A," a are mounted on imported annular b bearings. The front wheels carry 4-in tires and the rear 4½-inch tires. A American make can be supplied wi standard clincher rims. Other styles rims are furnished without extra char if desired.

The Rainier muffler has been retaine but has been increased in size. It placed transversely at the extreme re of the chassis and is provided with t

Fig. 4. Detail view of the Model D Rainier make and break ignition mechanism. This mechanism has bee plified, and instead of four vertical shafts, a single shaft at the rear of the motor operated from the car ft, drives by means of spiral gears a horizontal ignition shaft carrying four adjustable-in-position ignite s held by special clamping devices. The rotation of this shaft and the timing of the ignition can be varie a vertical movement of the spiral gear on the vertical driving shaft, making the timing as simple as o jump spark system. A short piece of wire leads from the dynamo to the center of the buss bar, which i nected to the plugs by means of knife switches. When in operation the electrodes are constantly charged only give a spark when the hammer leaves the anvil. In place of the small springs and the trippers an ers formerly used, the cams bring the hammers to the contact points, and immediately after the cams hav sed the breaking point, the hammers spring back rapidly under the impulse of a single powerful compressio ing, which works in an oil bath and is the only spring used in the whole mechanism.

also mounted, as in the case of the r wheels, on annular ball bearings, all these parts, including the steering ckle, being of generous dimensions. e knuckle is fitted with a hardened steel hing and hardened steel pin and an oil on top provides constant lubrication.

he front springs are semi-elliptic, 2¼ nes wide, and are of extra length. The r spring suspension has been altered 1908 and is now of the platform type differs from the ordinary construction the rear frame member is carried out kwardly at the centre and rests di- ly on the rear cross spring, which is

duck-bill vents so placed that the dischar of the exhaust gas is directly in the pa of the rear wheels, thus preventing t dust from rising and also doing away wi any chance of the gas coming up throu the floor boards. The exhaust pipe is 3 inches in diameter and the entire pipe h no sharp bends or angles, but runs bac ward from a rounded elbow, thus givi as little back pressure as possible. Ea car is fitted with a muffler cut-out co trolled by the pressure of the operato heel.

BRAKES AND CONTROL.

Both brakes for 1908 are mounted

The Ideal Transportation

The gentleman's roadster is the ideal connection between the suburban home and city office. It changes the hot, dusty journey on a crowded "local" to a pleasant ride in the clear, fresh air that fits you for the business of the day.

Rambler

The Rambler roadster, Model 34-A., is a speedy, classy car with the power and endurance of a touring car and the convenience of a runabout.

Mechancially it possesses every valuable feature found in any car at any price, such as offset crank shaft, straight line drive, large wheels, etc., and in appearance has a distinctive character of its own that marks it a thoroughbred.

An examination will convince that

It is the Right Car at the Right Price

Two other models, touring cars at $1,400 and $2,250.

g. 4. Detail of lifting rod and ng. The length is rod is adjust- by means of the piece, which, can rewed in or out. as a round end n comes in con- with the valve No rollers are and the rods off center with ct to the cams, e equalizing the

end, as shown in the sectional view, Fig. 4, which provides for jacent valve lifting rod housings or guides are held by yokes so that these may be removed by loosening a single nut. The valves themselves are combination, the heads being of cast iron to withstand the heat without warping while the stems are steel hardened and ground. These valves are of large diameter, thus allowing the use of a short lift in securing the full area of opening. The intake valves are lifted by the valve lifters direct, and from the illustration of the lifters it will be seen that the upper end is ball shaped, coming in contact with the center of the valve stem, thus avoiding any transmitting of side thrust to the valve stem itself. The lower ends of these lifting rods are not, as usual, vided with rollers, but are formed into circular disks which rest on the cams are sufficiently off centre so that they be continually rotated while in opera-, thus equalizing the wear. The ad- ment on these valve lifting rods is y simple and can be permanently ed. The exhaust valves are located in rocker.

IGNITION.

A double system of ignition, both high tension type, is used. One consists a Bosch high tension magneto with a se arate set of plugs and the other of a qua ruple coil, timer and storage batter Either system may be used entirely ind pendent from the other, the storage ba tery being used mainly for starting.

THE COOLING.

Circulation is maintained by a gea driven, brass-geared pump with a capaci of one gallon for every hundred revol tions of the motor, the circulation bei from the bottom of the radiator thru t pump to the bottom of the water jacke leaving at the top, from which it passes the top of the radiator. The cooling fa of rather large diameter, belt driven fro a pulley on the cam shaft, extended, mounted on a fixture on the forward cyli der and is not in any way supported on t radiator.

CHANGE GEAR.

The change speed mechanism is of t sliding gear type, selectively operated, t gears being of nickel steel. The case of aluminum, oil tight, as it is without t usual horizontal divisions, but the enti top forms a removable cover, the counte shaft being placed below the main sha These shafts are mounted on Ti ken roller bearings and can be co pletely removed thru the ends of t case, these openings being covered screw caps. A special locking devi is arranged to insure the gears b ing perfectly in mesh and remaining the and also making it impossible to enga

with four cross members. The flange
the junctions are integral gussets and

Fig. 6. Detail of the rear axle construction of the Great Western 4-cylinder models. This axle is of the fl
ing type, driving the wheels by means of squared ends. A spur gear differential is used. The entire construc
s mounted on ball bearings. The large brakes are operated by pull rods to the small levers and shafts which
shown mounted on the rear axle housing.

AXLES.

The rear axle is of the live floating type,
evel gear driven. The rear universal
oint forms a slip joint, thus allowing for
he action of the springs. The differential
of the spur gear type, three pairs of
nions being used. The rear axle hous-
g is provided with an aluminum cover,
hich being removed, makes all the gears
ccessible. The wheels are attached to
he driving shafts by means of squared
nds, these driving shafts carrying none
f the weight of the car. Both the ball
rusts and bearings of these shafts are
oused in dust-proof cases.

The front axle is a one-piece nickel
eel I-section drop forging. The pivots
nd steering knuckles are mounted on
rge ball bearings and the wheels are
ed in about 2½ degrees, giving easy
eering. The steering knuckles are very

cold riveted, making a very rigid and
liable construction. A sub-frame of sin
material and design is used to support
engine and change speed gear. The
frame is narrowed at the front, increa
the steering range. The motor can be
moved without removing the radiator

WHITE

THE CAR FOR SERVICE

A Touring Car in the True Sense of the Term

The man who gets the most pleasure from his touring car is not the ma who limits his touring to the macadam roads; for the most interesting sectio of the country and those of the greatest natural beauty lie, for the most pa beyond the regions of improved highways. For that reason there is no qua ity of a motor car more important than the ability to traverse bad roads.

In unique degree, the White possesses the qualities of a "bad roads" ca Owing to the perfect flexibility of the engine, the White tourist can accomm date the speed of his car, yard by yard, to the condition of the road, speedi up on each little stretch of good road, and slowing down for each hole a "thank-ye-ma'am"—without shifting of gears or any manipulation exce of the throttle. The tremendous pulling power of the White engine und all conditions means immunity from getting stuck in the mud or sand. Ru ning through deep water, as in fording streams, is easy for a White. And for climbing grades in mountainous regions—there is no other machine whi can approach the White in hill-climbing qualities.

DRIVE A WHITE STEAMER AND SEE THE COUNTRY

Are you in earnest about wanting to cut down your tire expense? If you are, buy an

If you really want to know what the Elmore saves in tire wear watch a heavily loaded street car vainly endeavoring to start up a slight incline when the tracks are slippery or icy.

If you want to know just what wear and tear on the tires the Elmore does not cause, watch those same wheels to which the power from the motor is applied whirl helplessly around and send forth a shower of sparks while the ponderous car barely moves.

To still further realize what an economical car on tires an Elmore is, watch another car on similar tracks slide along for many feet after the brakes have been applied to the wheels to keep them from rotating.

When you've seen these examples of wear and tear on car wheel tires you've seen wear and tear which is analogous to the wear and tear on the tires of any four cycle automobile. Perhaps not to so marked a degree, but analogous, nevertheless.

This wear and tear in a four cycle car is simply unavoidable because the inherent principle of the four cycle car is at fault. It is caused by the uneven and broken application of power.

In any four cycle car first there is a power stroke and then there follows an idle stroke causing a scuffing and jerking on the tires that hastens their annihilation.

The only possible remedy to this condition is the two cycle principle, as exemplified in the Elmore two-cycle valveless car.

In an Elmore such wear is impossible because the power application is continuous, and the wheels rotate at the same speed as the car moves.

Any agent will verify these statements---see one at once. In the meantime write to us for literature.

TROUBLE AFTER OVERHAULING.

Halifax, Nova Scotia.

Through the columns of the Journal will you kindly tell me what is the trouble with my engine? It is a 20 H. P. 4-cylinder Argyll Landaulette, fitted with a Longuemare carbureter, and has recently been thoroughly overhauled by an engineer, but as we have no motor experts in this town, I fear he has done something to the engine that is giving trouble, but am unable to locate it.

The engine is started with the ignition opened about five notches on quadrant on the steering wheel and the throttle open about 60 degrees. When it is going the ignition is opened up a bit more and the throttle closed to about 10 degrees on the quadrant, but if I am not careful she will stop dead, so I have to humor her by opening out a few degrees, then slowly closing her again. She races when opened out slowly, and even one notch will cause her to race or stop according as it is put ahead or back. I think she is getting too much gasoline, as she seems to choke, then clear suddenly and race. When I stop her, immediately the engine ceases to work; she throws out about a wine glass full of gasoline from the spray side of carbureter. I have examined the spray and needle valve, and they appear to be in order. and the latter seems tight. She was not like this before, and the man says the carbureter has never been altered, only cleaned out. The float is not leaking and valve is not stuck on float. When should this engine spark at cylinders with ignition lever nearly closed and when full open? Mine sparks from 30 degrees in advance to 30 degrees after centres.

W. G. S., "Subscriber."

It seems evident that some adjustment about the carbureter has been changed. What, I cannot say. Watch for loose parts at the critical point. If the throttle can flop or shift it may close itself and stop the engine, or open itself and let it race. Watch the exhaust and note if there is black smoke when it chokes. If so, this is proof that it is getting too much liquid. There is some adjustment wrong and you must fix it, and can only find it by observation. The position of the spark lever is of little importance so long as it has motion enuf each way to give you the advance and retard wanted. Try it and see if it can be advanced too much so as to cause loss of power or preignition. If so, it is more than enuf.—C. E. D.

TIRE INFLATION PRESSURES.

Lynden, Washington.

I have a 1907 Model "F" Buick and would like to ask thru the Journal about what pressure I should have on the tires with the ordinary load of five people? I have on my machine one Diamond, one Fisk, one Goodyear, and one International tire. Should the pressure be the same on both front and rear tires? When you say a tire should be pumped to 75 lbs. pressure do you mean with the wheel jacked up as a person ordinarily pumps up after making a repair or with the weight of the machine on the tire? On page 44 of your February issue, opposite 3½ in. tires you have two sets of figures for both load and pressure. If but one were used I would construe it to mean maximum and minimum load and pressure, but where two are used I do not understand it. Would you kindly explain? I am a subscriber to the Journal.

G. L. ALDRICH.

I do not see how the table can be more explicit than it is. A tire of 3½ inches diameter should never be loaded more than 900 lbs. Run your car on a scale and find out what it weighs and how heavy each end is. Then you will know how to inflate according to the table. If the weight is up near the limit, inflate to 78 lbs. If near 770 per wheel, inflate to 71 lbs., and if near 550 inflate to 57 lbs. Of course, if about midway between these figures, inflate to a middle pressure. Of course, these figures are not absolutely correct. Few figures can be in such a table. The user must use judgment. If the wheels are small the tires must be inflated harder than if the wheels are large, for there is less surface on the ground to take the pressure. If the tires are thick, they distribute the load over more surface than is in actual contact, so they will be too hard if inflated to as hard a pressure as a thin tire requires.—C. E. D.

HOW TO USE ACETYLENE AS FUEL.

Platteville, Wis.

In the February issue of your Journal I noticed a short item concerning the use of acetylene gas for fuel in automobile motors.

I would like to know how this is applied, if it is generated in the regular type of generator and how delivered to motor; also if any type of motor can be fitted for same and what fittings are necessary. Any information on this line will be greatly appreciated. I am not a subscriber, but am a regular reader of your journal.

WM. G. JARRETT.

I have had no experience with acetylene for motor fuel. I would handle it just as any other gas is handled and watch the result for possible improvement. Generate it in a generator and near the motor admit it to the air pipe with a valve in each pipe so only proper amounts of air and gas can get in. Some gas engine mixing valves are so made that as the gas is shut off the air opens and at the proper point there is the least resistance to the passage of both. This style of valve is best, for it does away with the necessity of trying to adjust two independent valves at one time with the result that you may get them both open or both nearly closed at the same time. A gas bag should be used to suck from and a light check to prevent the flow of gas while the engine is not sucking and while the gas bag is taking the flow. If you can see an engine using city gas you will get a lot of help. Gas engine catalogs often show the fittings needed for city gas; and acetylene would, I believe, only require a smaller size. It is a gas that is very rich in carbon and so requires much more air than common. It gives good power and much heat.

There has been some use of acetylene to enrich the alcohol mixtures, and this was secured by drawing the alcohol vapor past carbide. The water in the alcohol attacked the carbide and freed the gas. It would doubtless be possible to spray water on the carbide by the incoming air and so enrich the air by the gas thus generated. You could regulate the amount of water by a needle just as gasoline is regulated and so control the mixture. If you try the experiment we would be pleased to learn how you succeed.—C. E. D.

(Mr. Avery, of Avery Portable Lighting Co., Milwaukee, Wis., I believe has experimented along this line.—Ed.)

WHICH REQUIRES MORE POWER TO DRIVE, CHAIN OR BEVEL GEAR CARS?

Springfield, S. Dak.

Kindly answer through the Automobile Trade Journal the following questions:

Does it take more power to propel a shaft-driven car, up to 3000 lbs. weight, than a chain-driven car, and less for a shaft drive above 3000 lbs. than a chain drive?

Does not a piston with a six-inch stroke travel faster than one with a three-inch stroke, the shaft making the same number of revolutions in each case?

HANS MILLER.

To compare two cars as you ask is not easy in the space at command in this column. There is, however, no dividing line above or below which one is better than the other. The propeller shaft uses bevel gears and they lose some power. If a single direct chain is used, the loss is very slight, but a single chain is not considered good practice for a heavy car. Therefore two chains must be used and a counter-shaft provided with a propeller shaft to drive it. This may eat more power than a live axle and propeller shaft alone. Much depends on the bearings and design and on the protection from dirt. If chains had been protected, as gears have to be, there would probably have been fewer shaft-driven cars, for the chain is the most flexible and economical driving device. A piston making a long stroke in the same time as a short stroke, one must of course travel faster.—C. E. D.

(This question arises so often, a word of warning may not be out of place. In comparing a double side chain driven car with a shaft bevel gear driven machine it is not a question of the relative efficiencies of a bevel gear and shaft as compared to side chains, but simply whether one or two universal joints eat up more or less power than two side chains. This, it will be seen, is true, as a side chain car has two chains and four sprockets in addition to a regular bevel gear drive to its countershaft, while the shaft-driven car has two universal joints which the other has not.—Ed.)

BEVEL GEAR AND SHAFT VS. CHAIN.

Henry, Ill.

Will you kindly answer thru the columns of Cycle and Automobile Trade Journal the following questions:

By which drive, chain or shaft, do you lose the most power and in what particular part is it lost? Thanking you in advance for your kindness, I remain,

LEIGH LINCOLN.

Your question cannot be answered in a very satisfactory manner because of its lack of conditions or specifications. With a motor at the extreme front of a long chassis, there is little use of considering the chain. It would be longer than is good practice. But with the motor near the work, where it ought to be, the chain is the simplest and best. It has been estimated that single chain drives lose but five to ten per cent. of the power they transmit and that shaft drives lose probably twice this much, but this is not a fair comparison, for the reason that the motor is differently located in the two best cases. With the chain it is common to have the motor shaft parallel to the rear axle so there are no corners to turn. The chain wears at every pin, and when it gets longer does not fit the sprockets. It then must be forced down on the teeth which requires power, and this is the point of loss. The shaft loses at the gear teeth which have friction much as do the sprocket teeth; also at the bearings of which there are many. The universal joints are also a source of friction and trouble in many cases.—C. E. D.

(Attention is called to the fact that this is a comparison between a single chain and a shaft, and not the arrangement used with double side chain driving. See comment at end of inquiry, "Which Requires More Power to Drive," etc.—Ed.)

WORM GEARING.

Cleveland, Mo.

Would you please answer the following question in the columns of the Cycle and Automobile Trade Journal. Would a worm gear be a good gear to use where it is desirable to reduce from a high to a low speed?

G. W. McGILL.

A worm gear is used where there is a large reduction to be made with one set of gears. In the most common form of worm there is but one thread on the pinion, and the large gear moves but one tooth to each turn of the worm shaft. Originally the pinion was not made of pins, but of a single round rod wound spirally around the shaft, whence the name of the device. In auto work it is customary to use several teeth in the small gear and it is properly a spiral gear. Several makers now use this device, the Mitchell truck being one of them.—C. E. D.

CHANGING THE GEAR RATIO.

Bridgeport, Conn.

Your letter received, and it is certainly good advice from start to finish, but in this particular case I meant to ask you if in your judgment a car weighing 2100, with four 4x4 cylinders, of course with everything in good condition, would the engine handle a 3 to 1 gear, and what I meant to say was, what would be the difference in actual ratio of power (not bore) demanded from the engine between a 4 to 1, which is now on the car, and a 3 to 1.

In the first place, I did just as you advise. I consulted the auto car people, and their engineer wrote me that the outside casing covering the differential and gear was not large enough to get a 3 to 1 gear in, but I found out here that it was, and had the gear made and put in. They claimed it would be all right, but advised me to buy an all new rear axle, claiming that the housings would have to be chiseled away to the danger point to get the gear back in, which, of course, so long as I could get that gear in, I would not do.

I suppose my car was in perfect shape, having paid a good round price at a local garage to have it made so, and all these things I wrote you about I discovered myself, after having got mad and gone to work at it myself. I am not quite satisfied with a 4 to 1 gear, as it makes my engines race so to make 30 miles an hour, and still I am perfectly contented with any car with maximum speed 30 miles an hour.

I could have a 3½ to 1 put in, and between the 3 to 1 and the 3½ to 1, which in your judgment would be the best? I figure about 30 miles an hour at 1200 revolutions, 31-inch wheels, 3½ to 1 gear. Am I right?

C. H. SHANNON.

At thirty miles per hour your wheels are covering a half mile in a minute; 31-inch wheels make about 650 revolutions to a mile or 325 per minute. If the gear is 3½ to one your engine must go that proportion faster or about 1170 revolutions. In figuring a gear better keep in mind that you do not wish the maximum speed very often, but that the average or most common speed is the one to consider. Get it at the handiest and best ratio and let the maximum take care of itself. Of course you must see that the low gear is low enuf, for you desire ability to extricate yourself from bad places without the aid of a horse.—C. E. D.

WET CELLS FOR CHARGING STORAGE BATTERY.

Bonesteel, S. Dak.

Will you kindly inform me how to make a wet battery to recharge storage batteries? There is no electric plant here and we have to send our batteries away to have them charged. Any information you can give will be appreciated by the undersigned.

F. L. CROSBY.

Charging storage cells from wet ones is not very satisfactory work. You must have enuf wet cells to show more voltage than does the battery you are to charge or the electricity will not flow into the storage. There is some resistance, so if the charging is to be rapid there should be a considerable excess voltage. I have charged ignition batteries very nicely by connecting a dozen to fifteen wet cells in circuit against one four-volt storage cell. I left them at work all night and always had a full ignition battery. The trouble is to keep the wet cells at it and alike. Some give out quicker than others and then they are much like a half balky team. The willing can't work because the others won't. If you can possibly get power, better use a small dynamo. A little windmill should serve if nothing else is handy.—C. E. D.

MAKING A DRY CELL.

Tacoma, Wash.

I have been experimenting in the manufacture of dry batteries, but have not obtained the results looked for. Will you kindly furnish me a formula and details of manufacture that will show an initial amperage of 16-20? I made the batteries as follows: A zinc cup of the usual size, No. 6, was lined with three layers of fine blotting paper, the bottom with oiled paper, the blotting paper wetted with a saturated solution of sal ammoniac, the carbon filling was made with the following proportions: Gas coke ground coarse, 1 oz.; sal ammoniac, ½ oz.; manganese dioxide, Commercial, ½ oz.; zinc chloride, ½ oz.; water, 1 oz.; glycerine, ½ oz. This was packed around the usual carbon rod, and when tested showed 6 amp. The addition of a little graphite brought it up to 8 amp., but this was the best I could get. Do the battery manufacturers add any acid to bring up the initial amperage? Can a zinc cup be used from a discharged battery provided it shows no eaten effect? Must the carbon filling be ground fine and pressed in hard?

FRED G. BORDEN.

Not being a practical battery maker, I cannot give you the exact process nor do my battery-making friends care to have their secrets given away. The coarse gas coke is probably where your trouble lies. Use powdered or fine granulated carbon such as is used for battery carbons or for electric lights. The graphite is used with this to reduce the resistance. If fine and prest hard it has less resistance than if coarse. Much depends on getting it in evenly, for if hard at one end or one side and not compact at the other the one side will do most of the work instead of all sides working evenly. If packed hard it will take and hold more water without spilling. I think you have used too much glycerin.

If the old cup shows no effect, it ought to be all right; but if it gave current once, it is hardly possible that its full surface will be clean and in good shape for a second use. Your manganese should be free from impurities, as should everything else, for every impurity or irregularity sets up a centre of trouble and detracts from the output.—C. E. D.

STARTING AFTER A YEAR'S STANDING.

Watertown, N. Y.

Kindly advise me what to do to my runabout before I can start it. It has been standing on the tire for a year or so. The engine has been standing idle all this time. Please advise me what to do about it.

CHAS. E. Mc.

Long range advice on a specific case like this is not worth much. If the tires have been flat, they are probably cracked at the flat portion and worthless. If the rubber is still good there is nothing to do to the tires but inflate. If they leak, patch them. Much depends on the condition of the motor. If it has been in a dry place and was well oiled when put away, it should be ready for business at once. See that you have spark and fuel and turn it over. If you put a little gasoline into the priming cocks it will cut the gummy oil and help get it started. Be sure not to run it much, if any, till all the bearings are known to be oiled and free from dirt. One beauty of the auto is that it can stand a night or a year and be ready for work when wanted. If it is rusty, you must clean off the rust and get it back in proper condition as nearly as possible before starting it.—C. E. D.

HARDENING STEEL.

I am a reader of Cycle and Automobile Trade Journal. I would like to have you give directions through Journal for hardening nickel steel. A blacksmith here heated automobile cones a good red heat and put them in water, but they did not harden and had to be thrown away. I think they were nickel steel. Please give what steel they are made of and how hardened, and oblige

J. D. BUCHER.

It is impossible to advise you as to hardening steel unless its composition is known. The makers can probably advise you how to handle it. If the usual 3½ per cent. nickel, it is likely to crack and get brittle if heated very hot. The lowest possible red is hot enuf. —C. E. D.

SPARK PLUG ELECTRODE MATERIAL.

Camden, Ark.

As a subscriber may I ask of the proper department for information: Of what material are spark plug electrodes or sparking points made? Does it require some soft special material? Your reply will be appreciated.

J. W. BROWN, JR.

Ignition points, whether for high or low tension, should be of some material that is not easily carried away by the spark or destroyed by the heat. Platinum is probably the very best material, but because of its cost this is seldom used except as tips. The jump spark is of so little quantity that it is easily carried and does not burn away the points rapidly, so it may be carried by most any material, but if the points get a coating of oxide, it acts as an insulator and decreases the spark size. A material that does not oxidize easily is therefore best. A number of alloys are sold for this purpose, copper, silver and nickel being used in their composition.—C. E. D.

Steam Cars

J. A. KINGMAN

ALCOHOL AND ACETYLENE FOR STEAMERS.

Will you kindly answer the following questions through the columns of the Cycle & Automobile Trade Journal?

1. Has alcohol or acetylene ever been used as fuel for steam automobiles? With what results? 2. In a general way, what are the principal advantages, if any, and the serious drawbacks in the use of either of these fuels? A. D. KELLOGG.

Alcohol has been experimented with to a limited extent for use in steam car burners, but owing to the greater difficulty of the vaporization of the gasoline is decidedly inconvenient. The matter of convenience is one of the very first things to consider and it is very easy to conceive of a fuel which would be ideal but which also might be very scarce and this latter quality would make it absolutely worthless, because an automobilist must be able to get the same kind of fuel in all parts of the country at all seasons of the year without any difficulty whatever. For this reason it is difficult to say why acetylene gas should be seriously considered owing to the unstable character of the chemical compound from which the gas is made as well as to other equally great, if not greater, objections.—J. A. K.

2-Cycle Engines

HUGH DOLNAR

WANTS 2-CYCLE ENGINE DESIGNED.

Williamsburgh, Pa.

We are going to build a gasoline marine engine of the 2-cycle type, 5½ bore x 5½ stroke. We would like to know what H. P. this engine will develop at 600 revolutions a minute, also what thickness the I. S. and O. S. walls should be and what size the exhaust should be; which is better, round or square? What dimensions should the intake valve be? Would 2½ in. from the exhaust port be far enough for the carbureter? What size should the base be? The thickness of the iron and what size and weight fly-wheel would be most suitable for this kind of an engine? You will greatly oblige us by giving this information.

B. B. SUPPLY CO.

This communication is typical. In reply, first, granting that the Journal stands ready to design 2-cycle motors without charge for all applicants, the H. P. depends on so many variables that nothing definite can be determined from what is stated in this letter; a single 5½x5½ in. 2-cycle cylinder might show as much as 20 H. P., or as little as 4 or 5 H. P. at 600 R. P. M., depending on the charging system employed.

The cylinder walls may be 5-16 or ⅜ thick, and the water jacket walls may be ¼ thick, if these are the dimensions implied by "I. S." and "O. S." The exhaust pipe should be of greater cross-section area than the exhaust port area, and is made very much greater in some late 2-cycle designs. The cylinder exhaust port may be 4½ in. wide x 1 in. long, giving 4½ sq. ins. area. Pipes are commonly made round in form.

The carbureter might be undesirably warmed if placed 2½ ins. from the exhaust. Two-cycle motors do not commonly employ an intake valve. If an automatic valve in the cylinder head is to be used, it should be 2½ to 2¾ ins. dia. The fly-wheel may be 24 to 30 ins. dia., to weigh 150 or 200 lbs. Four cubic ins. of gray iron weigh about a pound and you can easily find the weight of your fly-wheel after you decide upon its form and diameter.

Nothing shows whether this proposed motor is to be horizontal or vertical; nothing can be told of base dimensions, save that the base walls should be not less than about ¼ in. in thickness.

Correspondents should give some careful thought to "Journal" queries. In this case the items specified are not sufficient for an enlightening reply.—H. D.

PATENTS AND REAR WHEEL STEERING.

Will you please answer the following questions in your two-cycle column?

Is the form of piston used in the Atlas motor broadly covered by patent, or could the same general arrangement be used by anyone? Using this form of piston with an air-cooled motor, it seems to me the best practice would be to distribute the ports circumferentially around the cylinder, in order to avoid distortion from overheating one side. If this is correct, will you be good enough to state what, in your opinion, would be the proper dimensions for exhaust and inlet ports, using a cylinder 4 in. x 4 in. What distance should be allowed for compression space, same having a diameter of 4 in., and of semi-spherical form.

I was very much interested, as well as instructed, by the valuable articles published in your February number. The motor I contemplate uses an extended piston to fill cylinder with pure air, and fuel pump to inject fuel on compression stroke. I am counting on injecting fuel one inch piston travel below

Hosted by Google

dead centre. Would this be too early? The motor in question would be used for a commercial wagon, and I would like to know if there is any objection to using a longer stroke in order to obtain a slower speed engine, instead of using smaller ports, as suggested in a recent article published in the Journal.

Is there any well founded objection to utilizing the rear wheels to steer the car? I believe that the distinct advantage of applying the power through the front wheels more than offsets any disadvantage which I can figure from steering by rear wheels.

If you will be good enough to answer these questions in an early number of your Journal I shall greatly appreciate it, as, while probably all of them are very elementary, my knowledge of the two-cycle problem is comparatively small, and of recent acquisition.

CHAS. ROBERTS.

The Atlas piston and arrangement is believed to be covered by patents either issued or pending. The circumferential exhaust is best in theory if the mere escape of the gases is the only thing wanted. But if allowed to escape all around they must be carried away and this means that the cylinder is surrounded by a hot chamber which is not conducive to best and easiest cooling.

I think ⅝ in. and ⅜ in. would be about right for the ports and I would use low compression making the compression space about half the displacement of the piston after the exhaust port closed. 4 x 4 x .7854 x 3⅜ in. equals 42½ cubic inches, so your compression space should have about 21 inches capacity. The semi-spherical head will contain half as much as a sphere and the contents of a sphere are found by cubing the diameter and multiplying by .5236. This is nearly 17 inches, so your cylinder bore must extend ⅜ of an inch beyond the piston at dead centre in order to get the remaining 4¼ inches.

The quicker you inject after the exhaust port closes, the better, for it gives the mixture more time to become homogeneous. In this method of feeding it is difficult to get a nice mixture, and if the mixture is not proper the exhaust is foul and much fuel is used with little resultant power. When you have it going we will be pleased to hear how it works and what sort of pump you employed for injection. It is well to work the engine at a fairly high speed, for this permits expanding the gases before they have time to cool off. 750 ft. of piston speed per minute is not too fast for a business wagon, and you will do well to lengthen the stroke so as to get this at the turns you expect to use.

There are many reasons why rear steering is not good. A rear steering cannot get away from the curb except by backing, and it must turn across a car track in order to get out of it. Try leading a cycle backwards and see how much trouble it is compared with the usual way. If you much prefer front drive, make the rig also front steering. I believe this will be much used in future for business wagons. Many people are trying to get a four-wheel drive, for this certainly overcomes the faults of slippery pavements and icy spots. It adds something to the complication, but it is really astonishing how much can be left off if one gets at a problem and hunts for simplicity. Now that the public are coming to their senses and looking for economy, it will be doubtless bring about much simplification.—C. E. D.

2-PORT VS. 3-PORT MOTORS.

Lethbridge, Alberta.

May I ask of you to give me a description of the difference between a 2-port 2-cycle and a 3-port 2-cycle engine, with their respective merits and demerits?

Have you ever published, and if so, in what numbers, any working drawings of a 2-cycle motor engine that a fellow could work from with a reasonable assurance of success. Of course, I mean for his own pastime, as I would like to build a 2 or 3-cylinder 2-cycle air-cooled of about 20 to 25 H. P. I may say the first engine I built two years ago was a 2 H. P. air-cooled 4-cycle and it is still running a 16-in. swing lathe and grinders. I am now building a 4¾ bore x 5 in. stroke water-cooled 4-cycle, but tho I know practically nothing about the 2-cycles, I want to learn.

"IGNORAMUS."

The term "3-port" is applied to crank-box-pressure cylinder-supply, 2-stroke-cycle motors only, and indicates that the piston is made to serve as intake and exhaust port valves for the working cylinder at its head, or, if the cylinder is vertical, top end, and also to serve as the crank-box intake-valve at the crank-end or lower end of the piston which last is known as the third port, and

distinguishes this type of 2-cycle engine from one in which the intake into the crank case is thru a valve of some type, these being known as 2-port engines. The accompanying figure shows a 3-port engine, the full line piston is at the bottom of its stroke with I (intake port) and E (exhaust port) open. I allows the crank-box charge transfer to the cylinder, while E communicates with the muffler. In this position the third port, 3d P. is closed by the top of the piston. The third port communicates with the carbureter. In dotted lines the piston is at the head end of its stroke with the charge compressed in the compression chamber, C, which is merely the top portion of the cylinder bore. The piston covers, I and E, but opens the 3d port to give communication between the carbureter and the crank-box. In traveling up from low point to high point the piston displacement has reduced the crank-box pressure to considerably below atmosphere, and as soon as the 3d port is uncovered by the ascending piston, mixture from the carbureter rushes into the crank-box to supply the partial vacuum. The 3d port is closed very early in the descent of the piston in making its working stroke.

It will be seen that the 3d port can be open but a short time, only 60 or 70 degrees of crank time at most, and that part of the charge sucked into the crank-box must be forced back through the carbureter before the piston closes the 3d port, and it is evident that the 3d port should be as short as possible axially, and have its area made sufficient by extending it circumferentially. It will also be noted that the carbureter is first violently sucked and then has part of the crank-case

Hosted by Google

charge returned to it through the 3d port. All of this tends to make carbureter action uncertain with the 2-cycle 3-port motor.

Instead of the 3d port a rotary valve may be mechanically worked even turns with the crank-shaft, see "Armature's" crank-box illustration, or an automatic valve opening to the crank box, may be placed between the crank-box chamber and the carbureter. This mechanically worked disk valve should open the passage to the carbureter when the piston begins to rise, and close the passage from the crank box to the carbureter as soon as the piston reaches its high position, thus opening communication between the crank-box and carbureter for 180 deg. of crank time. The automatic crank-box intake valve is spring closed and cannot deliver quite so great a volume of mixture to the crank box as the mechanical valve, which is the best of the three, and gives no trouble if lubricated, as it must always be if the lubricating oil is mixed with the fuel in the fuel tank.

As to working drawings of 2-cycle motors, several 2-cycle cylinder drawings with dimensions have been printed in the Journal, and if you read the Journal constantly you should be able to build a good 2-cycle motor, crank-box supply. Use the rotary valve for crank-case supply.—H. D.

2-CYCLE ENGINE DEFLECTORS AND FUEL INJECTION.

Napanee, Ontario, Canada.

I am in receipt of your letter of February 16th, for which I wish to thank you. I would infer from your letter that you suggest pumping directly into the cylinders. My reason for not doing so is as follows, and I thought I would write you so that you embody the answer thereto in any criticism you were making in the paper.

My experience has been that a weak mixture does not fire very regularly (especially on a four-cylinder engine) and below a certain percentage of gasoline you are not likely to get an explosion at all. In throttling down and using a pump spraying directly into the cylinder of the engine you would have when throttled below a certain percentage no explosions at all. A small increase in percentage would give you misfires and above that regular firing. My object was to have, even when throttled extremely low, pocketed in one part of the cylinder a mixture carburetted at its most efficient percentage so as to have sure firing at all throttled points.

I will probably this summer try an engine which I can shift from one to the other when I propose to build a three-cylinder 4x4½ engine. I am enclosing a drawing showing a couple of styles of deflectors, and in sending in your criticism on the engine please state which you would consider the best or any change you would suggest in the shape of either of them. Let them go in as before under "X." I think the sketches are self-explanatory, as I have marked several dimensions on them. I use, as you will notice, a 1-16 in. under-cut on inlet side of the piston. The distance between the inlet and exhaust port on the side would be 1 in.

When my designs are complete for the engine I would like to submit them to you for examination, but do not feel that I should do it through the paper. I would prefer meeting you and discussing the matter and paying you your charges for the consultation, as, being a civil engineer myself, I do not like to be a dead-head on another engineer on a subject of which he is a specialist.

(Signed) X.

Replying to X, I do believe that pumping fuel directly into the cylinder is the best method of 2-cycle motor fuel supply. I am now making drawings for a 6x6, 2-cycle, air-cooled motor, new mechanical movement for driving a separate supply cylinder which will a little more than fill the working cylinder with pure cold air from the top to the exhaust port. This cylinder is fitted with 6 pumps, 3 circulating force pumps and three supplying pumps, so that two kinds of fuel and water can be supplied to the cylinder in any desired quantity and at any time during the compression stroke of the working piston. I am greatly pleased with my design for this new motor, and am sure that it will tell me some things I want to be sure about. As to partial charge misfires and "4-cycling" of the 2-cycle motor when throttled close, see my long reply to Sherbondy. I am sure, from experiments, that a local rich charge of very small bulk can be placed about the spark in a charge of pure air, full compression, and so make the most "flexible" gas engine possible, and I believe this placing of a small quantity of fuel in the spark plugs immediate vicinity can be better ef-

Signature "X" Deflector Suggestions.

fected with a pump than with a carbureter, as the carbureter cannot handle the heavy liquid fuels I wish to burn. I have pumps which are ideal in construction and action, and have perfect control of fuel volume and injection time, all with an exactness quite impossible with a carbureter.

I believe your "style X" of deflector is much superior to "style Y," because it will direct the charge upward closer to the cylinder wall. Even with a pure air charge I believe the charge should be first carried up as close to the cylinder wall on the intake side as possible, so as to take the longest possible path to the exhaust port.

I am carrying my deflector straight up to within ⅛ of an inch of the cylinder head, as the pure air charge is in no danger of pre-ignition or self-ignition.

I will examine your 2-cycle design with pleasure, but I hope to be able soon to speak with such certainty as to 2-cycle motor performance that there will be no question as to the value of pump fuel supply, constant maximum compression and correct deflector form.—H. D.

Hosted by Google

A QUESTION OF EXHAUST PORTS.

Louisville, Ky.

I want to build a two-cylinder, two-cycle gasoline motor, four and one-half inch bore by four-inch stroke. I intend to build the ports like sketch inclosed and would like to know if ports are arranged right, and if the size is correct, to give free exhaust; also if the compression space is too small to allow ample size deflector. Could the thickness of the iron in cylinder be reduced without its being too thin, and get a good casting? In

Fig. 3 of sketch, could the exhaust pipe be cast as shown without the exhaust of one forcing itself around the piston of the other cylinder, as I intend to have the cranks set 180 degrees apart and have the impulses follow after each other. It is the height and width of the slots in the exhaust port which I would particularly like to know about.

SIDNEY C. PROBERT.

Your ports are far too narrow in circumferential extent, and have far too many bridges. Carry your ports through 120 deg. of cylinder circumference at least, and do not place more than three bridges in each port. You can reduce your crank-box clearance by making the intake port only ½ in. long, where you now have ⅝. You do not show your deflector form. Make the deflector as high as you can and clear the cylinder head.

The exhaust pipe you show is very bad. Place the muffler to one side and lead both exhaust branches to it with large radius curves, both pointing the same way, ordinary form. Make your exhaust piping large and free and give the exhaust one direction only.

A quarter of an inch is plenty thick enough for your cylinder walls and 3-16 is enough for the water jacket walls.

See Perry Okey motor in March Journal. This whole 3-cylinder Okey motor, crank-box, base-lugs, cylinders and water jackets, made in one piece of gray iron casting, is only 3-16 thick, one of the finest jobs of gray iron work I ever saw. It requires very accurate pattern and core-box making to produce such a thin job, and you had better try ¼ for cylinder walls and 3-16 or 7-32 for water jacket walls.—H. D.

ANOTHER HENDERSON DESIGN.

Buffalo, N. Y.

Having benefited by your criticism of my former design, I will appreciate your opinion of the accompanying sketch. Interested parties have mentioned certain difficulties with my previous design, one being serious, that of the piston tube overheating, the other increased motor height. On studying the matter over I concluded the pure air port scheme was bad, and by admitting the gas at the top I entirely overcame the overheating condition. As to increased motor height, it is not what it appears to be, being only about two inches in a motor of 4½-inch stroke. My reasons for abandoning the pure air port idea are these: I think it would be liable to have the reverse effect of what I expected of it, because a light mixture causes back firing. It would also have to have a throttle

in connection with the carbureter throttle, which would add complications. The oiling system shown works out in this manner. The oil enters at the top of small cylinder, oils small cylinder walls, passes thru tube shown, distributing thru wrist bearing to cylinder walls, thru hollow conn. rod to crank pin bearing. The drip from cylinder walls takes care of main bearings. The points of advantage I see in this design are improved crank case compression, oiling, carburization, charge placing and durability. I have not built a motor of this design, but have entered application for a patent, and would like to hear from any interested party who has the capital to push this design as an automobile motor.

WM. G. HENDERSON,
191 Hoyt St., Buffalo N. Y.
Formerly 10723 Olivet Ave., Cleveland, O.

This is a 3-port motor in crank box charging operation, and has the advantages of effecting a working cylinder charge entrance at the top of the cylinder, as far from the exhaust as the cylinder dimensions permit, without the disadvantage of an automatic intake valve in the cylinder head.

The castings are simple, the engine is easy to build and the double travel of the charge, first downward from the carbureter to the crank box, and then upward from the crank-box through the top ports of the top trunk into the cylinder, ensures cooling of the top trunk and also imparts a part of the piston and trunk superfluous heat to the incoming cylinder charge. The oiling is neat and certain. I regard this design as highly creditable.—H. D.

"NEMO."

A number of correspondents have sent requests for Nemo's address. All such letters have been forwarded to Nemo, who writes that he has replied to such, as he wishes to hear from at greater length. H. D.

A NOVEL 2-CYCLE SUGGESTION.

Wapanee, Mich.

Please find enclosed sketch for a 2-cycle engine upon which I would like your opinion.

The object of this engine is to first scavenge the burnt mixture with pure air and then admit enough (when working at full-load) mixture to fully fill the cylinder and compression chamber and when working throttled more air would be admitted and the perfect mixture would follow at the latter part so as to remain as much as possible along the inlet side of the cylinder and be compressed in that part of the compression chamber and fired there. To accomplish this I enlarge the lower part of the cylinder and piston so as to make an air pump out of it. At one side I have another cylinder which acts as an air chamber or rather two air chambers A and B separated by a piston P. I. See section of cylinder on X. Y. This cylinder is bolted to the side of the engine so that Chamber B. is directly connected by a passage to the inlet port of the engine. The air pump is connected to this passage by two check valves V. which can be readily removed to grind. Chambers A and B are connected together by an outside passage P. G. P. inside view contains a variable throw gasoline pump operated by the engine crank shaft through a set of bevel gears. The variations of the gas-

oline pump are obtained by shifting levers, not shown, in connection with the movement of Piston, P. I. so that when chamber B. is at minimum (capacity) the gasoline pump is working at its maximum stroke and when B. is at maximum the gasoline feed is completely cut off. The gasoline pump is connected to the passage P. between A. and B. so that the gasoline is sprayed into that passage. The volume of the air pump is such that it will compress the air into chambers A. and B. and connecting passages to a pressure of about ten to fifteen pounds (gauge). Now when the pump forces air into chambers A. and B., that portion going into chamber A. is carburetted by the gasoline sprayed into passage P. The piston then makes its downward stroke and (the air pump sucking in the fresh air through the air inlet A. I.) on reaching the lower part of its stroke will uncover the exhaust port E. and afterwards the inlet port connected to B. allowing the fresh air in chamber B. and passages to reach the power cylinder G. and scavenge the burnt gases first to be followed by the carburetted air in chamber A. When working at its maximum stroke chamber A. is of such a size that the carburetted air in it will fill the engine cylinder and compression chamber and passages B. On the up stroke of the piston the fresh air in the air pump will open the valves V. and drive first the carburetted air into passages and B. back into A. and the mixture in the engine cylinder will be compressed and fired at the upper part of the stroke. With throttled charge, the chamber A. would be reduced in volume and B. increased while the volume of gasoline or other liquid would also be reduced to correspond to reduction of A. In this case of course there would not be enough mixture in A. to fill B. and passages and G. would then be only partially filled with best mixture on inlet side and be fired upon that side. When completely shut off mixture in A. would just fill B. and passages driving out air while gasoline pump would stop and engine could then be used as a brake if in an automobile.—(Signature) X.

"X" sends sketches and specifications as reproduced above. As X is doubtless aware, the 2-diameter piston supply is well known, and can be well used with a 3-cylinder, 2-cycle motor, cranks at 120 deg., the supply or charging piston of one cylinder being used to charge the working cylinder next preceding in firing order: see "Euclid" motor, patent applied for, page 134 March issue. With a 3-cylinder motor the charge compression is about 15 pounds gauge, "Euclid" arrangement, if memory serves correctly.

X seeks to add another function to his single cylinder motor, that of scavenging by a separate pure air scavenging pump, and then, after the working cylinder has been swept clean by the pure air charge, X proposes to introduce the combustible mixture in such a way as to drive out more or less of the scavenging pure air according to the mixture volume passed into the working cylinder, G., from the mixture cylinder A., all as described in the specification and illustrated by the accompanying sketches.

The questions on this design are, is the intended action desirable, and are the results gained in the simplest way?

First, is it needful to ensure complete scavenging by filling the working cylinder more than full of pure air before supplying any part of the combustible charge? It is not necessary as the cubic displacement of the piston in A. P. C. can be made to force volume enough of pure air into the working cylinder, G. to more than fill G., wholly displacing the burnt residue with pure air.

Second, the gasoline pump, G. P., is specified as delivering a variable quantity of gasoline in form of spray to the interior of passage P. at the desired time. When so readily vaporized a liquid as gasoline this means that G. P. can if desired spray the fuel into the pure air charge in G. at any time after the working cylinder intake port is closed by the piston, so that the compressed charge will be either of nearly uniform composition throughout its entire bulk when compressed, or so that the charge will be richest in the immediate vicinity of the spark plug or point of ignition.

What, then, remains to be gained by the action of the piston, P. I., in the third cylinder, A?

The writer is convinced that the 2-cycle cylinder is sufficiently cleared of burned charge residue by the sudden opening of a large and unobstructed exhaust port area, to enable the working cylinder to be filled down to the top line of the exhaust pipe, with pure air from A. P. C., without blowing pure air out through the exhaust, and, also, that this pure air can be perfectly carburized by pump injection of either gasoline or kerosene.

If this belief is correct, then the working cylinder, G., the supply cylinder A. P. C., and the gasoline pump can do all that need be done, and the remaining agencies shown by X are redundant and should not be placed.—Hugh Dolnar.

(The supply cylinder A. P. C., as shown cannot be used on a single cylinder motor without some storage chamber between it and the combustion chamber proper as there is no compressed charge in A. P. C., at the time the piston uncovers the intake to the cylinder G., and this design is probably intended by X for a single cylinder motor only.—Ed.)

2-CYCLE ENGINE DESIGN CRITICISM.

Erie, Pa.

Will you kindly check over the following dimensions and construction of a two-cycle engine that I intend to build? I am also sending you drawing of same. You can do as you see best with it.

(1) Bore, 4 in.; (2) stroke, 4½ in.; (3) connecting rod, 6¾ in. C to C; (4) cylinder offset, ⅜ in.; (5) inlet port, ⅜ in.; (6) exhaust port, ¾ in.; (7) bottom of inlet and exhaust ports to be in line; (8) deflector and piston as shown; (9) inlet and exhaust ports to be separated by bridges 1 in. wide; (10) inlet to crank case by revolving disc valve; (11) three ring piston packing, wide ring outside. I think by making these rings this way I can dispense with bridges in the inlet port, thereby giving the fresh charge a clean sweep in the cylinder.

"Armature" Suggested 2-cycle Motor.

What size carbureter would you suggest for this engine? Is the deflector high enough? and what do you think of the shape of same? Crank shaft to be 1⅜ in. diameter; wrist pin, 1⅜ in. dia. x 1½ in. long; piston pin, 1 in. dia. Disc valve to be driven by crank arm engaging two lugs on disc. What do you think of closing disc valve about 20 degrees late or after the piston has passed the out-centre? Could I not get the benefit of the ramming action of the gas this way? and in so doing get a larger and purer charge into the cylinder. Are there any patents on any of the constructions I have shown?—ARMATURE.

The drawing shows a crank-box having more clearance than is needed if the crank-wrist end of the rod is made as small as possible by bringing the cap screws close to the wrist as may be. The other points noted are, (3) rod, 6¾ ins. C to C. This should be not less than 9 ins., two strokes. (8) The deflector should, I believe, be as high as it can be and clear the cylinder head, increasing the height as shown in dotted lines. There seems to be nothing gained by carrying the charge passage in the piston to an exit above the packing rings, if that is what the dotted lines in the piston head are intended to show. The drawing shows a piston port below the rings, also, and does not make the piston head construction clear. (11) I believe the 3-ring packing far better than the ordinary single packing rings, but would advise at least 1-inch width of wide ring, and should also place at least 3 bridges in each port, intake and exhaust. The port area is more than ample.

The mechanically operated crank-box intake valve is favorable to carbureter action and a pipe 1¼ ins. dia., carbureter to crank-box would seem large enough. The crank-box valve should close when the crank is on its low centre.

I believe this design does not infringe any patent, but am not sure as to the disk valve in the crank-box.—H. D.

(The Atlas Motor Car Co., Springfield, Mass., hold a patent on a disc valve intake into the crank case.—Ed.)

"NEMO" AGAIN.

"Nemo" writes a second characteristic letter to Hugh Dolnar, in which he details his experiences, which have cost him real money, in endeavoring to obtain original 2-cycle motor designs from "Experts." Each of these experts proposed to furnish Nemo an all-new and surely-best 2-cycle motor "design," complete working drawings for an up-set price, Nemo to pay the price before drawings were supplied, and to take whatever the expert sent in, regardless, and be good natured about it. Nemo complains that this may be fair to the highly skilled and of course fully competent expert, but does not really seem certain to give him a run for his money.

This whole matter can be correctly exhibited in a few words.

First, a new 2-cycle motor design to be of real value must show a motor which is not only patentable, but can show good B. P. H., fuel economy, is good to build and is durable.

Experts capable of producing a 2-cycle motor original design meeting these specifications, are not likely to offer their services for a small set price.

The Journal is forwarding "Nemo," communications from Victor Jakob, Plattsburg, New York, The Perfect Automobile Mfg. Co.; Walter C. Willard, 2353 E. 79th St., S. E., Cleveland, Ohio, and R. Foote, 4 Van St., Rochester, N. Y.—H. D.

MALCOM'S ENGINE WAS DESTROYED.

Please inform me about Mr. C. P. Malcom's engine that ran, as stated in the Journal for 24 hours at a total cost of 18 cents. I expected to hear about same in your columns and have looked for it every month.

ANTHONY ORTH.

This engine was destroyed by fire near Chicago soon after the 24-hour run, probably about 1904. It is believed that it had a 6x6 cylinder. The cylinder supply was by crank-box pressure, with side pipe to the top of the vertical cylinder which had an automatic intake valve in the head. The low cost of this 24-hour run developing 10 H. P. constantly, was due, mainly to the low cost of the fuel which was raw petroleum, costing in that particular instance, less than two cents per gallon, as the writer was informed by Mr. Malcolm.

H. D.

INTAKE THRU PISTON CENTRE.

Thompsonville, Conn.

I wish to thank you for your criticism of my "flying piston" scheme. I herewith send you a sketch of a deflector for discussion in the Journal.

You will see, when you consider, that when four-cycle machines come in with cylinders and pistons worn out, the owners, wishing more power, think that two-cycle cylinders could be substituted, since they must have new ones anyway. New if we could do this

Hosted by Google

without too much extra machinery, you will understand that some of us would have fewer worries.

The object of this deflector is to get the central charge effect so that motor will have "flexibility" and also to avoid both the piston valve and cutting ports in two planes.

More particularly I wish to apply this to engines already existing which have the side deflector. When re-bored, they will have to have new pistons, and if this type will locate charge so they will run throttled down, would like to use it.

I wish to use three rings in one groove, but do not like the appearance of piston with

Repairman Piston. A, elevation B, section C, suggested form.

ports in two planes unless snap rings are used.

To explain deflector: The whole top slants towards exhaust side except nozzle. The ports are cut clear around cylinder except bridges. The intake looks short in the drawing, but this is really a projection, and it is nearly half the piston circumference in width.

Will this device work all right?

Will the depression in piston head catch oil and make trouble from "carbon"? Should the nozzle be higher than the proportion shown? Should the area of nozzle opening be same as intake port? Will any part heat unduly? The depression in head is made to give plenty of room under nozzle. It is cored out farther toward exhaust port than necessary for gas flow to keep that part cool.

Would it be better to turn passage right up and core out below piston head for this purpose? What, in your opinion, is the best way to put charge in cylinder?

I note on page 60 of the February Journal you do not advocate fan or crank box pressure. If there is some good and simple way to put in a charge without using either of these or an extra piston, or rotary blower, or double piston or another cylinder for compression, or a bellows, it would fill a "long felt want" for those of us who are fixing over old engines.—REPAIRMAN.

Repairman's letter is printed in full, as it presents actual conditions, and the changing of existing 4-cycle motors to 2-cycle motors will probably be often attempted.

First, as to Repairman's piston, shown in Figs. 1 and 2. I am not an advocate of the 2-plane port placing, as I prefer the simple form of cylinder.

I do not think oil would collect in the basin, B, Fig. 2, but would suggest changing the floor to the form shown by dotted lines, D, to ensure sweeping the basin clean by the inrushing charge.

Central charge delivery nozzles have given self-ignition and pre-ignition by heating the thin top end of the central nozzle, N, N. To avoid this I have considered the form shown in Fig. 3, in which directing length of nozzle is obtained by carrying the nozzle wall downward instead of upward.

I am a firm believer in the supply cylinder in some form, in the pure air charge of constant volume, ensuring constant compression, and in pump fuel supply, eliminating the carbureter.—H. D.

OPEN CRANK CASE 2-CYCLE ENGINE.

Hoquiam, Wash.

I am sending you photos of drawings of a compound cylinder two-cycle engine that I have recently built. Have not made a thorough test of the engine yet but have run it some and it appears to work well; should say that I have speeded it up to 1000 or 1200 R. P. M.

I contemplate building another about 5 in. x 5 in. on the same lines, what horse power should I get from it on 600 R. P. M.; I want this next one to be slower for a boat, and as the pistons are necessarily heavier in this class of engine, I think a moderate speed would give best results.

How many pounds compression will give best results in the compression or pump cylinder? I thought from 10 to 12 pounds should be about right. What size should my inlet and exhaust ports be? Would you advise taking the gas through check valves in the offset or a third port? Will you please criticise this design. I have run gas engines more or less for 15 years but this is my first attempt at design.—Geo. H. Hitchings.

The Hitchings 2-cylinder 2-cycle motor, with 2-diameter piston supply, is not what is com-

monly understood by the term "compound," which signifies that a working charge after being used in the cylinder in which it was first fired, is exhausted into a second cylinder to drive a second piston. Compound gas engines have had extensive trials but, so far, are not known to have achieved a commanding commercial success.

The engine shown in Mr. Hitchings drawings, has four cylinders, two integral tandem pairs, the lower cylinders being the larger in diameter. Each cylinder is fitted with two pistons, integral and tandem, the lower end of one cylinder acting as a supply cylinder for the other working cylinder.

The ports for a 5 x 5 cylinder should, in my opinoin, be 4 inches wide, by ⅝ intake length and ⅞ exhaust length.

The charging cylinder pressure will depend on working cylinder intake port length and on the passage volume between the supply cylinder and the working cylinder intake port. For as slow a speed as 600 R. P. M. 3½ to 5 pounds charging cylinder pressure is ample, and since charging cylinder work is an entire loss the pressure should be as low as will cause the charge to go to the working cylinder in the time available. There should be valves between the carburetor and the supply cylinders, and also between the supply cylinders and the working cylinders. The 3d port makes a fluc-

Hosted by Google

tuating demand on the carburetor which is not easily satisfied. A pair of 5 x 5 cylinders, as shown, should give 25 to 30 H. P. at 600 R. P. M.—H. D.

COMPRESSION AND IGNITION.

The Editor of the Journal, April issue, page 79, foot of first column, asserts that it is a "fact" that the charge is more easily ignited when only moderately compressed than when it is more highly compressed. In view of the "facts" that the Diesel and other high compression motors ignite the charge by compression alone, and that all recognized authorities assert that the higher the compression the more ready the ignition becomes, and that many motor builders favor comparatively low compression as making the charge less liable to pre-ignition and self-ignition, it is evident that the Editor either has information not generally known, or has made an erroneous statement.—H. D.

(H. D. is perfectly correct in his statements above in regard to self-ignition, etc., in stationary engines of Diesel type, in which compression pressures of four and five times those used in automobile motors are employed. There is no discussion in regard to compression pressures sufficient to raise the temperature of the mixture to or near the critical point. Furthermore the temperature due to compression was not what was referred to in our editorial comment on 4-cycling of 2-cycle motors nor was that comment intended to be generalized to cover other than the small 2-cycle engine conditions in question, in which probably the maximum compression pressures are not over 80 or 85 pounds. What we intended to convey was the idea, that the pressures due to compression are not the cause of 4-cycling of a 2-cycle motor and have very little if anything to do with it and that if there is any difference, a charge is more difficult to ignite regularly at 80 or 85 pounds than at lower pressures owing to the irregularity and poorness of the spark under high compression. This is shown by the failure of plugs to spark under compression which spark readily at atmospheric pressure. That 4-cycling is not caused by low compression will be appreciated when it is remembered that a correct mixture will explode regularly and without a miss, even when not compressed at all if a good spark is supplied, and the commonly accepted theory of 4-cycling is that given in our comment.—Ed.)

PECULIAR IDEA OF CRANK CASE PRESSURES.

Will you please tell me how much space I will have to have for compression at A with 40 to 50 pounds in the crank case.—J. A. N.

(This communication is not sufficiently clear to indicate just what J. A. N. desires to know. However, we judge the proper clearance space, ordinary practice in a 4½ bore, 4 inch stroke, 2-cycle motor is desired. About an inch to one inch and a quarter according to the shape of the head will be sufficient. But the crank case pressure 40 to 50 pounds marked on the drawing shows J. A. N. is laboring under a

delusion. No such pressure is possible without the use of an auxiliary piston and is not even desirable. From 4 to 8 pounds can be had by piston displacement, possibly more by carefully reducing crank case volume.

The crank case pressure has practically no effect on the compression pressure in the cylinder except that at high speeds a low crank case pressure will not cause a sufficiently rapid charge transfer to place in the cylinder even an amount equal to the piston displacement, while at a higher pressure slightly more will be transferred during the same limited intake port opening duration.—Ed.)

Opinions and Suggestions

Under the above heading we will be pleased to publish letters from our readers, expressing opinions, stating how they have overcome difficulties, or making useful suggestions. In this department will also be published longer communications or articles, of either a general or technical nature. This department succeeds the "Difficulties Overcome By Users" department, owing to its growth and the varied nature of the matter received.

FINISHING CYLINDERS WITHOUT GRINDING.

In the April number of the Trade Journal is a letter from S. D. F. asking for information on the subject of cylinder finishing without grinding. As I have had some experience along this line will try and help the gentleman out. I think the best way to finish cylinders without grinding is to lay them in with cylinder oil and ground glass, machine oil will do but cylinder oil is better. Run them for about 3 hours, driven from the line shaft sometimes it is policy to run them six or seven hours, but usually 3 hours will give a good job. Emery should never be used, except in the form of a wheel, the writer has never known any trouble from emery being imbedded in the cylinder walls when used in wheel form and work well cleaned with gasoline before putting cylinder on motors.—J. F. Richman.

IN FAVOR OF STANDARD JIG BUSHINGS.

Woonsocket, R. I.

I was much interested in Mr. F. Wertheim's article in Trade Journal of March 1 in regard to standard bushings for jigs, and I am quite sure they could be sold in very large quantities if made right and sold at a fair price, and I think very few shops would make their bushings if they could buy them right, and I should thing some one with the proper facilities would put the smaller sizes on the market at once.

E. R. DARLING.

COIL DAMAGED BY DISCONNECTING SECONDARY WIRES.

Apparently few motorists realize the damage which may be done to a coil by disconnecting a secondary wire from its plug and running the engine without grounding this wire. Under these conditions the full voltage of the secondary current is discharged thru the air gap of theoretically infinite resistance and grave danger is run of breaking down the insulation of the coil. Secondary wires when disconnected should always be grounded upon the engine or frame if the engine is turned over with the switch on.

EXPERIENCES WITH WOOD TIRES ON A RUNABOUT.

Dover, N. H., U. S A.

Perhaps you will be interested to know the result of my experience with wood tires as described in my article in the February issue of the C. & A. Trade Journal.

I have tried out these tires on the rear wheels of my automobile. The method of attaching the tires proved to be very good as they were firm on the rims as long as I used them. When I first used these tires the roads were frozen and somewhat rough. Driving my car over the frozen ground made a noise equal to a freight train. There was no use for a horn.

The car did not ride hard with the wood tires, and going over crossings there was not as much recoil as with pneumatics. The traction of wood tires, while good is not equal to that of pneumatics, as my car skidded more than when I used pneumatics.

Soon after applying the wood tires, we had a snow storm which was followed by rain, leaving the roads icy. I was obliged to use chains on the tires and then my trouble began. After a short run I found one of the bridges broken, which connect the rear axle housings over the sprocket. I put in a new bridge forged from good machinery steel, and in a day or two, both the threaded ends of this bridge dropped off. I then set Norway Iron studs into the bridge, and the next run I made with chains on, one of these studs jarred off.

After repairing my rear axle for the third time I felt that I had had enough of wood tires and took them off. I have been using pneumatics since and have had no more trouble with the rear axle.

A serious objection to wood tires is that it requires much more power to drive them than pneumatics. Hills which I could take easily on the high gear with pneumatics had to be taken on the low gear with the wood tires. There is no perceptible give to a wood tire, and the whole wheel and axle has to raise up over every obstacle, which is of course not so with pneumatics. Even chains on wood tires make a continual jiggling of the wheels, which not only jars things to pieces below the springs, but eats up the power of the engine. I found that my wood tires wore uneven and soon became out of round.

From my experience with these tires I am satisfied that no solid tire is practical for an automobile, unless it be of some material much more resilient than wood.

GEORGE WILLS.

VALUABLE INFORMATION?

One of our worthy contemporaries in its question department, in answer to a subscriber who complains that his dry batteries run down very rapidly, says: "The fault is probably due to the ignition. See that it is correct and powerful, and if the trouble still exists, investigate the carburetor." We have no doubt the recipient of this answer now has no further battery trouble.

ANOTHER SLIPPING CLUTCH PREVENTIVE.

An oily clutch leather can be prevented from slipping by first cleaning it with gasoline and then coating it with a mixture of "Fullers Earth" and glycerine, mixed to a creamy paste.

The Toledo Automobile Club, of Toledo, Ohio, has recently been added to the membership list of the American Automobile Association.

A tally kept for one hour on upper Broadway, New York, this winter, while the streets were coated with ice, showed that just 63 per cent. of the traffic, outside of trolley cars, was motor driven.

A SPECIAL PISTON RING.

In the accompanying cut is shown a new method of forming a gas-tight piston ring as used in a new European truck. In a single groove in piston P, three rings are placed as shown, the outer rings R being forced not only against the cylinder wall C, but also against the sides of the groove by the wedge-shaped junk ring J; thus making a gas-tight joint. The rings and also the groove in the piston are ground accurately.

CRACKED CYLINDERS AGAIN.

Still another method of repairing a cracked cylinder is to place over the crack a mould tightly clamped in place. Fill this with a mixture of dry plaster of paris and iron filings. Fill the jacket with water. This will moisten the mixture which will swell and force itself into the crack where it hardens, stopping the leak.

Low temperature reduces the efficiency of dry cell batteries and often when one seems to have given out, the simple expedient of warming the cells will re-vitalize it sufficiently to take the car home, or to a place of supply.

In the absence of other means, if it is suspected that there is water in the gasoline this can be proved by pouring a little of the fuel upon a coin. The gasoline will quickly evaporate and the water if any, even in small quantities, will remain and can be detected.

An ingenious method of disposing of the rear light nuisance, these having a decided tendency to go out, is to arrange a small box set within the lower part of the rear of the body. In this is placed a small electric light while the back has a stencil of the license number and also a small round hole, the letters being covered with opal glass and the box with red.

According to recent tests by Professor Goss: "A combination of graphite and lard oil makes a lubricating mixture which, when applied to ball bearings, will accomplish everything which lard oil alone will do and which at the same time will give a lower frictional resistance of the bearing and permit a large increase in the load which it may be made to carry. An oil as light as kerosene, when intermixed with graphite, will be converted into an effective lubricant for ball bearings when operated under light or medium heavy pressure."

When preparing the engine for summer it is well to see that the valve push rods or toppets are properly adjusted so there will be no hammering. This should be done with the engine warmed up as the length of the valve stem particularly that of the exhaust is greater when hot. The correct adjustment can be determined by placing a piece of rice tissue paper, which is about one one-thousandth of an inch thick, between the toppet and valve stem and adjusting until the paper is just gripped, but can be pulled out.

At the recent annual meeting of the Automobile Club of Philadelphia a motion was introduced to amalgamate all the automobile clubs of Philadelphia and vicinity. This combination would include the A. C. of P., 500 members; Quaker City M. C., 300 members; Germantown Automobile Club, and the Delaware Automobile Club.

ends of rods are fitted with cast rod-ends of polished brass machined and fitted thus obviating all possibility of rattling or of rods splitting.

All fronts are furnished in mahogany finish, unless otherwise specified. All edges are trimmed with half oval polished brass and metal parts are highly polished brass.

The "Millwood" Windshield, No. 1, Folded.

The bottom rail is made sufficiently wide to allow for the dash fitting. The No. 1 frame is 43 inches wide by 37 inches high and is quite suitable for heavy cars No. 2 frame is 41 by 35 inches and is suitable for lighter cars, runabouts and roadsters.

Whitney Flexible Chain Belt

A new driving belt has recently been devised by the Whitney Mfg. Co., Hartford Conn., the well-known chain makers. This is known as a chain belt and has all the quietness and flexibility of a belt combined with the strength and non-stretching qualities of a chain. It is, in fact, a combination of chain and belt, the leather coverin

THE THOMAS

AMERICA'S

CHAMPION

NEW YORK—PARIS RACE

BULLETIN

$1,000.00 REWARD

All We Ask is a Square Deal and No Favors

While many competitors are fair and realize our victory benefits the whole American industry, certain knockers, to boost their sales and injure ours, have made false and malicious statements that the Thomas Flyer was not a stock car, that cylinders were changed, and that the car was necessarily rebuilt during the race. We hereby notify them that their statements are false and malicious and must cease, or they will be prosecuted to the fullest extent of the law.

We make the following statement in order that our friends and the public may know the truth, and we offer $1,000.00 reward for proof to the contrary.

WE HEREBY CERTIFY that the Thomas Flyer in the New York-to-Paris race, IS ABSOLUTELY AN ORDINARY STOCK CAR selected only six days before the race, and was not especially prepared or tested. Furthermore, it is identical in motor, clutch, driving shaft, radiator, carburettor, transmission gears, frame, wheels, bearings, and in all other essential features of its mechanism with hundreds of Thomas cars now in use by Thomas owners.

WE ALSO CERTIFY that the Thomas Flyer ran from New York to Cheyenne, a distance of 2,028 miles, almost entirely over roads made practically impassable by snow and mud, climbing mountains, plunging through ruts and fording streams, without overheating once; without repair or replacements of cylinders, spark plugs, transmission, radiator, bearings, clutch, carburettor or other mechanical parts—except at Buffalo, not having time to do so before shipment to New York, a regular stock axle, such as Thomas owners have been using for two years at Tonopah and Goldfield, was substituted for the dropped type—which, however, was in perfect condition. In fact, the only breakage was two chain links, easily replaced, and a sprocket housing.

Detailed reports beyond have not been received, but telegraphic reports state repairs were insignificant, and that the car arrived in San Francisco in splendid condition, ready to proceed on the long journey, a feat unparalleled in the history of automobiles—the longest and severest endurance contest in the history of the world, and one that makes the Glidden Tour on well

The "Anderson" Spark Plug

The unique feature of this plug is its insulator which is made of glass. While it is generally supposed that, because of its frailty, glass would be most unsuitable for the purpose, the makers of the Anderson plug claim to have thoroly demonstrated the suitability of glass as an insulator of a spark plug. In the Anderson plug the glass is, by a special process, welded with the steel shell and becomes integral with it.

Sectional view Anderson Spark Plug.

Being perfectly non-absorbent and a non-conductor of electricity, the glass makes an ideal insulator and the special process of welding the glass and steel provides the necessary strength it is claimed. The perfectly gas tight joint thus produced is another advantageous feature of the Anderson plug, and the glass insulator also provides a means of observing the sparking while the motor is in actual operation.

This plug is made by Anderson Spark Plug Co., and W. E. H. Hutton of 348-352 Fulton Street, Brooklyn, is the sole distributor.

The Park Drop Forgings Co.

The Park Drop Forgings Co., has recently established itself in a large, new and well equipt plant at East 79th Street and Gordon Park, Cleveland, Ohio, for the purpose of producing drop forgings. The treasurer, Dwight Goddard, and the superintendent, T. B. Smith are experienced drop forge men from the best shops. The purpose of the management is to do only the highest grade of special drop forging, paying especial attention to forging, and treating alloy steels.

Facilities are provided for making one piece automobile axles, and multiple throw cranks, steering knuckles, gear blanks, and transmission parts. The company has a paid up capital of $100,000.00 and starts out with one of the best plants in the country. It is of steel construction 200 feet long, and 65 feet wide, with an ell 60 ft. x 60 ft. The building has a noticeably high monitor roof for ventilation and the whole lower part can be opened up during the summer by lift doors. One end of the building is made two stories to accommodate the machine shop which is fully equipt with the best modern tools.

The forge shop has 15-ton over head cranes over the hammers, furnaces, machine shop and railroad tracks. The hammer equipment consists of nine Chambersburg steam and Waterbury board drop hammers running from 1000 to 3000 pounds, with the latest oil furnaces arranged to preheat blast and oil. The blast is from a special Sturtevant fan directly connected to a motor.

Power is applied to the machinery thru individual motors placed overhead on the trusses and operating sections of shafting. Steam is supplied by an Erie City Tubular boiler thru main pipes overhead and exhaust underground to heaters and

Monopol Piston Rings

Theo. Boerner Mfg. Co., 26-28 Union Square, New York, is the sole U. S. agent for a new piston ring which is manufactured by the Monopol Piston Ring Co., of Berlin. These rings are not made of cast iron, as usual, but are made of the best grades of Swedish and Scottish cast iron which, because of its toughness, elasticity and low co-efficient of friction, is especially suitable to meet the requirements of the case. They are also made by a special method which is claimed to give them great elasticity so that they perfectly fit the cylinder bore and no further refacing or wearing is necessary. These rings are guaranteed to be perfect circles not varying one-tenth of a millimeter. They are made either eccentrically or concentrically, with or without overlapping joints.

Cleveland-Canton Spring Co., Canton, Ohio, has installed machinery for the testing of Vanadium steel springs in a new building recently added to its factory. A new rolling machine, used in the manufacture of springs, has also been added.

The Canton Drop Forging & Mfg. Co., Windsor Lane and Odd Row, Canton, O., manufacture special drop forgings in quantities to customers' specifications. They recently installed an up-to-date oil treating and annealing outfit to take care of specifications for high grade material as well as for heat treatments.

.., are including in their 1908 line two entirely new products, one the L. & M. Tire Shoe Loosener and the other the L. & M. Vehicle Washer. Besides these two entirely new accessories they have made some minor improvements on their Minute Tire Adjuster. They are also now putting up the Minute Adjuster in a bag for convenience in stowing away in the tool kit.

L. & M. Tire Shoe Loosener.

The L. & M. Tire Shoe Loosener is very convenient for loosening tires which have become rusted or frozen to the rim. It consists essentially of a wide jaw, the end of which rests against the rim of one side of the wheel and the other end of which contains a pinion and rack mechanism which forces the arm against the opposite side of the tire by the raising of a handle. The handle is detachable so that the tool can be taken apart and placed in small space in the tool box. The tool is made in one size only, but is adjustable to any size, style or make of tire. The price is $3.

L. & M. Vehicle Washer.

The main feature of the L. & M. Washer is the fact that the mop is made of cotton mop rope which, while serving the same purpose as an ordinary sponge, is much cheaper. The handle portion is of brass and, of course, lasts indefinitely, while the mops can be renewed at slight expense. This washer is so arranged that the water

is turned on full or only one-half. washer lists complete at $1.75 and mops can be had for 50 cents each.

The "National" Windshield

The National Auto Top Co., Inc., 1904 Broadway, New York City, manufacturer and jobber of auto tops, folding glass fronts, wind shields, slip covers, etc., has recently placed on the market a new windshield called the National, which is illustrated herewith in open and closed positions.

The "National" Windshield, Opened.

The changing of this shield from one position to the other is accomplished by simply turning two small thumb screws, which release the upper section, which in turn can be folded back and locked by tightening the thumb screws. This front can be applied to any car without interfering with the lamps or steering wheel in any way. The frames are of genuine solid

The "National" Windshield, Closed.

mahogany, either light or dark, and finely finished. The attachments are of solid polished brass. The glass is selected polished plate, 3-16 in. thick. The edges inside the frame are bound with felt. The list price of the shield is $50.

"Laman" Tops and "Stick Tite" Bow Separators

L. L. Laman Auto Top Co., Utica, N. Y., manufacture extension, coupe and runabout tops for motor cars, and, while offering nothing radical in this line, base its claims for business on the high grade work turned out. In these tops, it is claimed, the best grades of cover material are used, bows, sockets, linings, etc., and that the top joints break right so that whether extended or folded back and in the dust cover the tops are of proper shape. These tops are said to fit perfectly when applied to the car.

All Laman tops are fitted with "Stick Tite" bow separators without extra charge. This separator has previously been described and illustrated in these columns. One of its main features is the fact that no screws are used in attaching it. It bolts to the socket in a novel way, which gives it a vise-like grip and insures a firm hold.

"Williams" Divided Wind Shield

We illustrate herewith the "Williams" divided wind shield in upright and folded positions, and also show a detail view of the locking device used on this wind shield. This wind shield is so constructed that the upper sash can be brought to any one of

The "Williams" Divided Wind Shield In Open and Closed Positions.

three positions without removing a nut or thumb screw. This is accomplished by means of a simple locking device at each end of the frame. The cross sectional

Details of the Locking Mechanism of the "Williams" Divided Wind Shield.

view of this device herewith plainly shows its constructive features. As can be seen, a small hook is provided which is easily grasped by the forefinger, and to change the position of the upper sash these two hooks are pulled downward and outward, allowing the sash to be moved to any position desired, after which they spring to locking position. These wind shields are made with both brass and wood frames, and all parts are interchangeable. This shield is the product of Twentieth Century Motor Car Co., South Bend, Ind.

SIX YEARS OF SUCCESS

HOLSMAN

1907 Sales Over $600,000.00

Six years of successful manufacturing have made the Holsman car the leader of all high wheel automobiles. That it is the leader is undisputed, and in order to be entitled to this distinction the car must have features that will appeal to the purchaser.

Solid rubber tires and high wheels do away with the enormous tire trouble and expense, and insure comfortable riding and ability to travel bad roads.

Repairs Average Under $3.00 per Month

Air-cooled engine eliminates freezing water in winter and boiling water in summer, and also does away with complicated castings.

Cable drive makes it possible to apply the power near the periphery of the wheels where the leverage is greatest.

Official Gasoline Record, 29 Miles Per Gallon

Easy and simple control makes it more possible to avoid accidents.

There is an absence of complicated and expensive transmission gears, differential gears, friction clutches, friction bands and universal joints; all of which are subject to great wear and the source of continual expense.

Handsome new Catalogue mailed free on request.

able distributor arm is shown at the cen- tre of the cut and the terminals for the secondaries are, as usual, on the outside of the ring. These are well protected by vulcanite caps.

The 4-cylinder ignition outfit complete sells for $60 and the 6-cylinder for $70 which, considering the fact that four or six vibrating coils are dispensed with, is very reasonable.

"Amoco" Automobile Oils

American Oil Co., 168-170 South Water street, Jackson, Mich., has a special line of oils and greases for automobile use, and makes a leader of its "Anti-Carbon" oil which is of light body and pale color. "Anti-Carbon" oil is adapted to use on all makes of gasoline cars, both air and water-cooled. The company recommends that after a few days' use of "Anti-Carbon" oil, while en-

gine is hot, a teacupful of wood alcohol be injected into each cylinder and allowed to stand over night. The next morning the engine should be speeded up for five or ten minutes, which will work out all carbon accumulations, after which, with continued use of "Anti-Carbon" oil it is claimed that further carbon troubles will not arise.

Four grades of "Amoco" oils are made for those who do not want a light oil like the "Anti-Carbon." The medium, heavy and extra heavy grades are for hot weather use and the light for cool or temperate weather. The "Amoco" line also includes oils for steam cars and for transmissions; also solid oil or cup grease, graphite grease and a soap for cleansing automobile bodies.

y, has recently placed on the market e "Multiple" spark plug, the main fea- e of which is that it gives several simul- neous sparks in the cylinder at each com- ession.

The several sparks are obtained by a ies of rings or electrodes which are so ced as to form a bridge for the current ich is forced to jump these gaps and erefore give a number of sparks. It is known fact that if an outside gap is ced in the plug wire, the spark is in- sified and in designing the "Multiple" g it has been assumed that a succes-

he "Multiple" spark plug, perspective and sectional s; A, special attachment for use on up-to-date cars; brass washer; C, mica washers; D, mica tube pro- ing rod; E, brass nut; F, steel rod; x, x, steel rings ctrodes).

n of gaps on the inner end of the plug ll intensify the spark in proportion to e number of gaps used; hence that the ength of the spark is very much in- eased by having to jump the gaps formed the rings referred to above.

Another feature of the plug is the sim- city of its construction, the mica core ing easily detached from the nut by sim- knocking it upon its head; yet there is possibility of leaking, the core fitting one 1000th of an inch. The "Multiple" n be used with magnetos as well as with ls. The list price is $1.50.

e "Miller" Quick Action Grease Gun

The accompanying cut illustrates the ller quick action grease gun for use in ricating the transmission gears and arings of automobiles and motor boats. is the product of Miller & Starr, 250 eene St., Brooklyn, N. Y., and possesses umber of meritorious features which rec- mend it to the attention of those who

for advancing the plunger when the han is turned toward the right.

The plunger in the barrel of the gun advanced rapidly and with uniform mo ment by turning the handle shown, o four turns being necessary to empty t gun of the eight ounces of grease which will hold. The gun can be very quic

IN presenting to the buyer of printing this illustrated and descriptive review of our new plant, we desire to emphasize one fact, viz.: that it is strictly a Daylight Establishment. Every nook and corner is practically as bright as an open field, with the exception that there is no sunlight. Proof of the wonderful amount of daylight is given in the photographs used for illustrating this description. These were taken without the aid of artificial light, and as they were almost instantaneous, it will be evident to you that the "Daylight" Plant in reality is all that we claim for it.

Yours very truly,

CHILTON PRINTING COMPANY

Market and 49th Streets :: Philadelphia

JAS. ARTMAN GEO. H. BUZBY C. A. MUSSELMAN

The Daylight Plant
OF THE
Chilton Printing Co.

THE HOME OF THE "CYCLE AND AUTOMOBILE TRADE JOURNAL" AND GOOD PRINTING

SINCE the time of Benjamin Franklin the art of printing has been so rapidly developed that to-day it is considered by many as having almost attained a state of perfection.

During the many years in which hundreds of thousands of men have struggled to make printing one of the fine arts of the civilized world, the greatest natural aid given to man has been overlooked, viz.: daylight. Is there a painter or photographer who would think it possible to obtain artistic results in a dark, gloomy establishment? And yet printers, with few or no exceptions, have struggled against the greatest handicap to their trade, the lack of proper light. Even the plainest printing in black requires strong light to obtain uniformity, and when color work is to be art work, daylight is an absolute necessity.

The Chilton Printing Company early realized the necessity for a modern establishment, and in the design of their new building at the corner of Market and 49th Sts., Philadelphia, the architects were given instructions which specified that every nook and corner of the establishment would have to be brilliantly illuminated by daylight.

Sunlight produces many shadows and reflections, and therefore is not practical for the printing business, and to overcome this objection and yet have the full benefits of daylight, it was necessary to have a steady north light. To obtain this result, the building was constructed having the roof in the form of the teeth of a saw, with skylights facing the north, and the slanting roof to the south.

Thus the printers' principal handicap was avoided and a great asset added to the store of excellent facilities of the Chilton Printing Co., who next turned their attention to the mechanical equipment, always keeping in mind the object of the organization, to still further advance the art of printing.

Hosted by Google

The machinery is all in one large room on the ground floor, and every inch of space is as bright as daylight can make it; so that the artisans are afforded the greatest aid—nature's light—in an abundance which has heretofore been denied practically all those who have sought to make printing a real fine art.

Knowledge is the next essential. The men in all departments must be experienced and competent. From the Superintendent to the Foremen; from the foremen to the most modest workers, we have selected as our assistants only those who have served their apprenticeship, have earned a reputation for being superior in their particular branch of trade, and who are known for the excellent work they have produced.

Next in importance is equipment, which means both the machinery and the methods of operating it. We think we are safe in stating that there is no other printing establishment in this country of an equal size, with as new and as good machines as are to be found in the plant of the Chilton Printing Co. All the Presses, Type-Making, Feeding, Folding, Gathering, Stitching, Covering, Binding and Cutting machines are the late models of the best makes, and are driven by individual electric motors, thus placing the speed control entirely in the hands of the operators of their respective machines.

To the three most important factors in the production of art in printing,—*daylight, knowledge* and *equipment,*—can be added *protection* against loss of time and money due to fires resulting from great or hazardous risks. The character of construction of the building, plus the automatic sprinklers and other safety devices, has so reduced the danger from fire that inspectors have rated it as one of the best risks in the State of Pennsylvania, and in consequence reduced the insurance cost to a minimum. For this reason, the Chilton Company will insure, free of charge, all the plates and other valuable property of its patrons. Two large vaults—one brick, the other concrete—have been provided as a still greater safeguard against loss by fire. Both these vaults have fire doors and are equipped with sprinklers, which additional protection practically guarantees that the contents cannot possibly be damaged by fire. The plant is located on the corner of two prominent and wide streets, and there are no adjacent, hazardous fire risks. To the North is Market St.; to the South is a large piece of ground belonging to the Chilton Printing Co.; to the West is 49th St. and to the East is an open lot. The plant is therefore practically isolated from danger of fire from any outside source, as well as from within. The building is but one story high, with a basement under a portion of

Hosted by Google

the office section only. This basement is built of brick and concrete, including the ceiling, as an additional precaution against fire. Special stress is laid upon this feature, because insurance protection is only partial protection, as it is impossible to estimate the loss resulting from delays caused by fires, which, in many cases, are so great as to totally overshadow the value of the stock covered by the insurance policy.

The true art of printing necessitates an artist at the inception of the order, for in no other way is it possible to obtain absolutely artistic results. The artist should be the first to be brought in touch with the order, and for that reason the Chilton Company has connected with it men who are, in temperament and by training, printing artists—men who can design and execute attractive catalogs, booklets, mailing cards and calendars, or anything in the printing line; men who can originate as well as execute the sort of printing that commands respect. The Chilton Printing Co. is therefore prepared to plan, design and execute catalogs, booklets, etc., including the drawings, plates, compilation and printing. By having full charge of the work from beginning to end, it is possible to obtain artistic results. Where several different interests are at work, there is always a lack of harmony which is in evidence in the finished product. Without harmony a piece of printed matter may be ruined, because crude handling at the start may prevent an artistic finish. The facilities which the Chilton Printing Co. has to offer are of an unusual character and assure the buyer of good printing, good results.

SUBSCRIPTION AND MAILING DEPARTMENTS

USUALLY this feature of a trade paper is not much in evidence, because circulation in many cases is more imaginary than tangible. In the case of the Cycle and Automobile Trade Journal, however, the Subscription Department is one of the principal features of the business; for to maintain 20,000 readers of the kind that are most desirable and to take care of the wants of subscribers is a task requiring a large office force

Digitized by Google

THE EDITORIAL DEPARTMENT

IN addition to the regular staff of editors, the Cycle and Automobile Trade Journal has special contributors and traveling representatives. It is very probable that there is no other Journal in the same field having so large and complete an Editorial Staff. Although the publication is issued but once a month, it is deemed necessary to maintain this large force in order to obtain, regardless of cost, the best material possible for the Journal

Hosted by Google

ADVERTISING DEPARTMENT

THIS special feature of the business is probably one of the most important, because advertising to-day is one of the greatest helps to modern business. Here are planned and executed the many campaigns which make known to buyers throughout the world the advantages of the Cycle and Automobile Trade Journal as a publication and the Chilton Printing Co. as a printing plant. This department, in addition to the usual clerical

BINDING MACHINES

THIS is one of the latest types of machines manufactured for the binding and covering of magazines and paper-bound books. After the signatures are gathered into books on the Collating Machine, they are placed in the grippers of the Binding Machine. The first operation is to cut off the backs of the signatures; second, to rough them; third, to dust them; fourth, to blow off lint; fifth, to put on glue, which is melted by electric heat; sixth, to pick up cover; seventh, to clamp it fast; eighth, to deliver completely bound books

Hosted by Google

GATHERING MACHINE

THIS Gatherer is technically termed a Collating Machine and gathers signatures or forms of catalogs, books or magazines which are placed in hoppers on one side. This machine is capable of gathering 30 signatures at one time. Moving arms pull the under sheets to a traveling chain, to the delivery board shown in the foreground, and here the completely gathered books, ready for pasting or stitching, are turned out at the rate of

CATALOGS

¶ Under this heading are issued all kinds and characters of booklets and books. Thousands of dollars are spent judiciously, thousands of dollars are wasted. If a catalog does not have individuality or if it is not attractive in appearance or well printed, it is often an expense which does not bring adequate returns. If the catalog is unnecessarily expensive in make-up, paper, etc., it sometimes becomes a piece of extravagance and therefore cannot prove profitable to the advertiser.

¶ The right kind of a catalog at the right price is always a "money-maker." We have made a careful study of the catalog question and are prepared to go into this matter in detail with you. Our experience plus our facilities are sure to produce for you catalogs that are "money makers." Inquiries solicited.

"Making Good"

It isn't a joke for a new automobile to appear on the scene just now, when there are already upwards of fifty-seven varieties bidding for the public eye.

We know very well that for the Oakland car to succeed just at this stage of the "game," it must have **mighty good reasons** for existing—that's just the point we want to impress upon **you.**

The reasons are very plain—so simple in fact, that if you will only weigh them carefully one by one, you can see for yourself, without any argument on our part, that the Oakland is going to be **the** big medium-priced car on the market this season, because it has definite well-defined advantages to offer the prospective purchaser.

Why the Oakland Takes the Lead

Let's throw out of consideration for a moment the low-priced runabout, and the high-priced touring car—the market for both of these types of car is held by three or four leading manufacturers.

The demand for a moderate-priced light family car is the demand that is most heard today, and the Oakland fills the demand logically, because—

The Oakland is the lowest-priced car of its power with direct shaft drive. The Oakland is the lightest car of its power and capacity. Run it on the scales and prove it.

The Oakland is the cheapest car to **own** and **maintain,** because of this lightness and weight, because of its care in construction, and because it has less moving parts and adjustment **by over 50 per cent.** than any other car of equal power and capacity.

The Oakland is beautiful in the simplicity and taste of its body lines and finish.

The Oakland motor is original in design—two vertical cylinders, perfectly balanced and **free from vibration,** and gives 20 horse power **at the wheels.** Designed by Alanson P. Brush. Do you know of anything like it?

We believe that agents who take up our proposition now are in to make a lot of money. You will be **as** enthusiastic as we are over the Oakland after you have looked it over. Write us today for full particulars.

Oakland Motor Car Co.

The Du-Ro Shock-Spring

One of the latest shock-relieving devices is the Du-Ro Shock-Spring, a device for eliminating shocks by using the leaf spring principle. It is the work of Duncan Robinson, sales office, 89 State Street, Boston, Mass. The inventor, taking his cue from the fact that the leaf spring is acknowledged to be the most superior method of supporting an automobile body, has utilized this form of spring to advantage in the Du-Ro, two views of which are herewith shown. The upper illustrates the relative position of the device which is attached to the car frame, and the end of the operating chain which is connected to the axle. Any motion of the axle except toward the device tends to pull on the chain and rotate the revolving ring, which motion is resisted with ever increasing force by the two bunches of small graded-in-length leaf springs, which are held by an S-shaped cross piece abutting against the rigid hub. Any desired tension may be had originally by varying the number and thickness of the individual leaves and afterward by hooking up the chain shorter or putting an initial tension on it with car body in normal position.

As stated by the inventor, automobile springs must be strong enough to carry the weight under all conditions, and for this reason cannot be made so that they will properly resist their own recoil. Therefore, an extra device must be used, working along the same lines and having the same "give and take," but carrying none of the weight. To carry no weight it must have no resistance at normal, but must have a "give and take" resistance, which, starting at nothing, will increase progressively in strength, to a point far beyond any possible demand. This the Du-Ro accomplishes, as any movement of the car body except in the direction from the axle toward the device, is subject to the same progressive restraint as are the up and down movements. Now, as the front pair are in front of the front axle, and the rear pair are back of the rear axle, the front pair restrain the forward motion and the rear pair restrain the backward motion of the car body relative to the axle. Therefore, the Du-Ro shock-spring restrains four motions—the up and down, but the forward and backward as well.

As every movement away from the device pulls on the chain, and as no movement can be away from both pairs at the same time, it will be seen that this device is continually using its power to "centre" or bring the car body back to the normal position from any direction.

The set of four sell for $60, f. o. b. Boston, the maker stating that the price will be refunded to any dissatisfied purchaser upon receipt of the springs within thirty days of their purchase.

The Du-Ro Shock Spring, a new shock absorbing device using leaf springs. The upper view shows it under normal conditions and the lower shows it in action.

In the first automobile races ever held in Havana, a Winton Six-Teen-Six won for runabouts having between 25 and 50 horsepower, defeating one American and four foreign entries. The time was 2.11 3-5 over a 1.7 mile course, distinguished by one sharp and very dangerous turn.

The Webster Extension Gauge

The Webster Mfg. Co., 248 Jefferson avenue, Chicago, Ill., have brought out a new type of their Webster tank gauge, the new type being called the Webster Extension Gauge, so named from then fact that the tube carryig the gauge can be adjusted to any desired length, the purpose of this new gauge being to allow of its being placed at the middle of the front seat against the divided arm in the usual type of individual seat now used. The adjustable feature consists of a cone-shaped band cut on one side like a piston ring, a flanged, exteriorly threaded collar and an interiorly threaded collar with a knurled edge to enable the user to screw it down to the other collar. When these three members are separated, they slide freely on the tube, and when the desired length is obtained the flanged lower collar and the interiorly threaded upper collar are screwed together, forcing the cone-shaped ring between them, producing a wedge effect, which locks the tube at the length desired.

The Webster Extension Gauge.

Improved Idler Attachment for 1903-4 White Steam Cars

This device is manufactured by the Auto Trading and Repair Company, 2167-69 E. 9th Street, New York, and can be used only for the 1903-4 White steam cars. The object of this idler is to provide means whereby the engine can be run idle for any length of time desired allowing the engine to attain its normal beat and to expel all water in its cylinders due to condensation or other causes, thus preserving the packing and increasing the life and efficiency of the engine. It also eliminates hand pumping, should the car steam pressure get low. The idler is furnished complete ready to connect to the machine, and can be fitted with little or no trouble. It consists mainly of a jaw clutch keyed to the drive shaft and normally held in engagement by means of a helical spring encircling the drive shaft and interposed between a collar on the shaft and a flange on the short sliding sleeve which carries one portion of the jaw clutch. A pedal is provided to disengage the clutch. The other member of the clutch has a squared end which is inserted in the universal joint of the engine. Price of the complete outfit is $45.

The Wridgway Automatic Headlight Shade

Charles G. Wridgway, manager of the Peerless Motor Car Co., of New York, 220-224 W. 41st St., N. Y. City, has placed on the market a shade for acetylene headlights, designed to soften the glare of these lights at a short distance from the car without interfering with their brilliancy at long distances so that the purpose of the headlight is not destroyed and yet dangers from the blinding glare at close range is entirely eliminated. This screen consists of a series of thin horizontal plates extending across the face of the lamp behind the front glass. These plates are dull black on the top, so that upward-

Diagrammatic illustration of the effect of Wridgway Shade.

cast rays of light are absorbed. The lower side of each plate is silver-plated, thus intensifying the light rays which are thrown below the level of the eye. At a distance of 200 yards from the lamp it is impossible to see any effect of the shade, the same not being visible at this distance. As the distance is decreased, however, the screen comes more and more into effect, so that at close range the blinding glare is entirely eliminated, and the light appears dull. These shades can be fitted to any of the automobile headlights on the market.

The royal patent has just been granted by His Majesty, King Edward Seventh of England, to the Michelin Tire Co., making them official purveyors of tires to the throne and incidentally to the royal motor cars. This is a much coveted privilege, as it almost invariably results in the adoption of the article so favored by all the members of the court, the nobility, the near-nobility or aristocracy, and so percolates down through the various social strata until its use has become universal among every class whose pocketbooks will stand the strain.

The 1908 Year Book of the A. C. A. will be distributed free of cost to all members of the Club, and to the Subscribers to the Bureau of Tours, the new class of Associates just authorized by the Board of Governors; it is expected this class will run up in the thousands.

fering to the trade a new demountable m called the "American," which it claims n be placed on and taken off of the heels in 45 seconds. Standard clincher ms already in use on any car can be ted with this device, lugs being riveted the clincher rims and so placed that ey slide into slots in a band that is fastned to the wheel felloe. No clamps or olts are used, the rim being held by means an eccentric cam.

The "American" Demountable Rim.

The rim is made of a special metal. The se is of aluminum, making the rim exedingly light and non-rusting. The band th the slots already cut is fastened upon e felloe of the wheel, hot or cold, which a simple operation and can be done in few minutes by any wheelwright.

The Casey Tire Case

The Casey tire case is a tire protector anufactured by the Case Tire Casing Co., Mt. Pleasant, Ia., the main body of hich is made of chrome leather subjected a special mineral tanning process which ves it toughness and elasticity. This ather is entirely free from oil and will erefore not injure the rubber tire. It is so claimed to be as nearly water and at-proof as it is possible to make it. This sing completely covers the tire and bears ainst each part with equal firmness. hese protectors are made to fit any rim the Clincher type. The tread is reforced by one ply of special oil tanned ather, which is made fast by rivets and rrs for obtaining traction on the road the leather fibre to work freely under burr without being pinched, thus addin the life of the tread. All the rivets heavily coppered to prevent rusting injury to the leather. The clamps hoo the rim and are cut from tough steel heavily aluminized to prevent rust They are very securely attached to leather casing.

The Casey Tire Case.

This concern also manufactures tire tecting sleeves for use to prevent blow-o etc., over weak spots of the tire. Th sleeves are manufactured along the sa lines as the tire protector, and they be had with or without armor. The Ca tire protectors list at from $10 for the 2 in. size to $30 for the 30 x 5 in. size. tire sleeves list at $2 and $2.50 respect ly for the two sizes, one of which is the 3½-inch tires and under, and the ot for 4-inch tires and over.

he Rutherford Pneumatic Wheel

he Rutherford Auto Wheel Mfg. Co., of nford, Conn., are offering a new type pneumatic wheel, consisting briefly of heel within a wheel. The outer wheel, ch comes in contact with the road sur- e, is flexibly connected with the inner el with a pneumatic tube interposing ween the two parts, so that as the el travels over road obstructions the er portion is allowed some amount of and shocks are taken up by the pneu- ic tube. The tube, however, does not e in contact with the road surface and efore puncture is impossible. The ufacturers call attention to the fact the weight of the vehicle is not car- upon the small portion of the tube, as he case where a pneumatic tire is used, according to the requirements of the ca Should by any accident the tube becom deflated while the vehicle is in motion, th wheel will not swerve, as it could not dro suddenly as in a case of collapse of pneumatic tire. The outer tread bein solid, its circumference cannot change, an

The Rutherford Pneumatic Wheel.

therefore swerving will be impossible. Th makers claim that they have successful operated a 7-ton vehicle with less than pounds air pressure in the pneumatic tub For touring cars they furnish wheels of in. diameter and for heavy cars 36 in. diameter. The wheel for touring ca weighs about 75 pounds and for hea vehicles 200 pounds.

"Franklin" Lubricants

The Franklin Oil Refining Co., of 306-3 North Commercial St., St. Louis, M manufacture a line of high grade lubrica ing oils and greases and are catering esp cially to the automobile trade with sever grades of lubricants especially adapted its uses. One of the features of Frankl oils is the thoro filtering to which they a subjected, which results in the producti of almost white oils, free from carbo The A-C special brand is for air-cooled m chines; nine different brands are offer for water-cooled machines. For steam m tors the E brand is offered, which has very high fire test, and for transmissi and differential gears special oils which not run are offered. Besides these oils full line of cup greases are carried a the company is prepared to meet any quirements in automobile lubrication.

The H. W. Johns-Manville Co., 100 W liam Street, N. Y. City, has recen

Baum's Brass & Pattern Works, 242-246 hird Ave., South, Minneapolis, Minn., have rought out an entirely new type of anti-kidding device, which unlike most anti-kids, is not attached to the tires, but is mechanical device entirely separate from e vehicle wheels. As will be seen in the ne drawing herewith, it consists mainly

The Perfection Anti-Skidding Device.

two pairs of metallic discs, one pair at-ched to each rear wheel, which are ought into contact with the road surface means of levers and arms worked by a dal. The arm (6) is rigidly attached to e axle casing and a lever (7) is pivoted to a sleeve in one end, the other end of e lever having pivoted to it a short bal-ced equalizing bar (9). Each end of is bar carries a revolving steel disc (11) ghtly concaved. Each disc engages with e roadbed when the lever (17) is de-est, this action transmitting motion to e rod (16), then to a rock shaft (15) and the above mentioned lever (7). Two of ese discs are placed on each side of the r and both pairs operate in unison so at depression of pedal (17) brings the hole four discs in contact with the road once. It will be observed, or course, at this device is only brought into play hen there is chance of skidding and is t continuously in use.

The Baum's Brass & Pattern Works are king care of the Western trade, but de-e to make connection with some concern manufacture for the Eastern trade. ey have obtained patents fully covering s device, and would like to find some ncern who will manufacture it in the st, paying them a royalty.

"Columbia" Metals and Solder

Columbia Smelting Works, 363-369 West

able prices.

Besides these bearing metals they m solder in both wire and bar which are furnishing the automobile trade. T also deal in ingot copper, spelter, pig and tin, make alloys of all kinds and nish aluminum in ingots for casting poses.

The Webster Muffler

The Webster Muffler Mfg. Co., of Ga burg, Ill., have just brought out a muffler for gasoline engines which is simple and compact, being about 6 in. l by 6 to 8 in. in diameter for cars, and 6 long by 2½ to 3 in. in diameter for mo cycles. This muffler is made of a num of flat-faced rings and has a closing h for each end. On the inside of the end

when he is not around, dips into practic all sports. His name often appears a winner of a trophy at a trap shoot, or if

Hosted by Google

of Canada or Maine with rod or gun. With all this, he finds plenty of time to throw energy into the business, and he is posting himself all the while as to what the Sportsman or Athlete wants. Mr. Murray keeps his weather eye on the automobile department, and is responsible for the excellent system of circularizing and "follow-ups" and the financial management of the company. He can tell any bookkeeper or clerk how to do his work or can do it himself if the worst comes to the worst.

There are now between 50 and 60 employees, and most of the business is done with the dealer by mail. A few salesmen are kept on the road more with a view of making the acquaintance of the customers and to encourage them to send in their orders by mail rather than to solicit immediate business. Formerly no traveling salesmen of any kind were employed, but now that the business is such a large one, three men are traveling most of the time.

Real success has been won by judicious advertising, by never exaggerating a statement, and by refunding money without talk to any dissatisfied customer. Three separate catalogues are issued describing Gun and Athletic Goods, Automoblie Accessories and Bicycles and Supplies, and these are distributed yearly to dealers upon the company's mailing list. These lists are made up from replies to advertisements, asking for catalogues, and great care is taken to keep the names up to date and to keep off the name of any person who is not regularly engaged in the buying and selling of Sporting Goods, Automobile or Bicycle Supplies. Every two months, or sometimes oftener, these lists are addressed, and a dealer's bargain book forwarded, and customers are posted promptly about changes in prices or advised of new goods which have been added since the catalogues were issued.

EXPORT TRADE.

A specialty is made of the export trade, and correspondence is carried on in practically all foreign languages. This department, which is in charge of Mr. J. D. Koebler, not only handles the goods regularly carried by the company, but does considerable business in other lines on a commission basis, shipments being made of anything from sewing machine needles to ice cream freezers. The export trade is slow to come but very faithful when once secured, and if it is slighted in the least, trouble is sure to follow. How the company began to make a special play for this trade came about in this way: In 1898 an illustrated catalogue was issued, which by comparison with the present catalogues was not a particularly creditable product, and a copy was mailed to a South American firm in answer to a postal card request. No real business was expected, but to the surprise of the officer who opened the mail, a letter came postmarked "British Guiana" and upon being opened a $200.00 Post Office order fell out. From that day to this one of the company's slogans has been "Export Trade A Special Feature."

A particularly desirable feature in connection with the management of the business is the system of bi-monthly "inspection." Two officers of the company accompanied by a stenographer start in at the top floor or sub-cellar of the building and look into every nook and corner. Drawers in desks are pulled out, order files looked over, goods removed from shelves, and notes are made by the stenographer which are afterwards incorporated into a report, a copy of which is handed to each department manager. This inspection is complete even to calling attention to a gas tip being out of order or a little dust on the top of a clock. The plan has a wonderful effect in keeping the store and stock in shape, and department managers take pride in getting a report with complimentary remarks in place of justified complaints.

All the latest labor saving devices are used in the office such as adding and billing machines loose-leaf charge books and ledgers, triplicating receiving and shipping blanks, vertical filing cabinets and card indexes. While the detail, no doubt, seems considerable to an outsider, the business is handled easily and orders are filled with much more promptness than by smaller houses who do not have their system so well worked out.

The Weber Implement Company, of 415 Main St., St. Louis, Mo., has taken the agency for the Glide car.

B. F. Everett, of the Wayne Automobile Co., is a strong advocate of "making good" on guarantees, and recently went so far as to send a man from the factory at Detroit to Pittsburg with a new rear axle to replace a defective one on the car of a customer. His instructions to the man were: "See that you make a good job of it. Ship the defective axle back, pay all expenses and thank the customer for telling us about it instead of knocking the car." The complaint had been received on a Saturday afternoon and the man was rushed to Pittsburg that night so that the customer would not miss his Sunday ride.

A novel contest was recently conducted by the H. H. Franklin Mfg. Co., among its dealers. A solid gold 21 jewel watch was offered as a prize to the dealer who would send in the best ten reasons why an automobile buyer should select the Franklin.

The contest lasted for four weeks, fifty-seven contestants taking part. All were carefully examined by a committee consisting of H. H. Franklin, president of the company; John Wilkinson, chief engineer; and F. R. Bump, sales manager.

The prize was awarded to Irving R. Gardinier, superintendent of the automobile department of C. H. Childs & Co., Utica, N. Y.

Safeguarding the Garage Against Fire

Fire insurance companies are naturally interested in seeing that the buildings they insure are made as proof against fire as is possible and while their desire in this direction arises from a mercenary motive, the general safety of the public and the safety and welfare of the "assured" are both safeguarded by the seemingly extreme precautions taken by the fire insurance companies. It does not pay any man who is in business to stay to have a fire and this applies as well to garage owners as to other lines. Live automobile men will therefore be interested in an article by Alfred G. Patton which appeared in the January number of "Insurance News" on the subject of garages as a fire risk.

The article is too lengthy for complete reproduction here but we give below sufficient extracts to cover the main features of the same.

After a few preliminary remarks relative to the subject in general the writer gives the following recommendations in regard to the proper construction of garage buildings, the handling of cars, oils, etc.:

BUILDINGS.

"Buildings of standard fire-proof construction, not over five stories in height with all floor openings protected, without turntables in floors, and with floor areas subdivided by fire walls, present the best type of structures for this class of occupancy. All boilers for power or heating should be in separate buildings not communicating with main structure. No dynamo or gas engine should be permitted in or under rooms where gasolene is stored or handled. No exposed artificial lights should be in the buildings.

"Heating should be permitted only by steam or hot water. Repair pits should be of fire-proof construction and drained and ventilated to outside of building. The outer building should be so constructed that all floors are freely ventilated so as to insure a continual change of air.

HANDLING CARS.

"As far as possible machines should not be run into the building under their own power, and in no case should a steamer or a steam-driven machine be propelled in the garage. While the securing of an honest observance of this requirement would perhaps be a difficult task, yet efforts in this direction should be determined and continuous.

"The cleaning of acetylene gas lamps and the removal and renewal of carbide should always be done outside the building and under no circumstance should the residue from an acetylene lamp be thrown on the floor of a garage.

REPAIRING.

"If repair work is done in the building, the repair shop should be so located that forges, etc., shall not expose any possible gasolene fumes. All machines before being taken to repair shop should have volatile oils removed from the tanks and no gasolene should be permitted in the room.

INSPECTION AND TESTING.

"The use of extension electric wires in the repair room is to be condemned, as such a wire coming in contact with the sparking attachment of a machine may cause a flash and a fire. Where such extension lights are used only extra cable should be installed, and lamps should be should be installed, and lamps should be wire screen over the bulbs. No cut-out switches should be permitted in rooms where gasolene fumes are liable to accumulate. Testing of motors should always be carried on outside of the garage, as the sparks of the machine may ignite gasolene fumes.

CLEANING.

"The almost universal practice of cleaning or washing automobile parts inside of garage with gasolene cannot be too strongly condemned. There are perhaps but few garages and repair shops where this is not done, even in close proximity to exposed flame; and while explosion and fire consequent on this cause may by a fortuitous chain of circumstances be delayed yet it is inevitable. Should it become absolutely necessary to so clean certain parts of the machine, the automobile should be removed from the building far enough away in the open air as to warrant that no fumes shall find their way into the garage. This work should not be done on the roof of the garage, owing to the well known fact that the fumes of gasolene are heavier than the atmosphere and therefore in all likelihood would find their way from the roof into the building.

(*To be continued.*)

Retail Notes

The Babcock Electric Carriage Co. has recently opened a branch in Chicago at Nos. 1328-30 Michigan Ave., right in the heart of the automobile trade district.

W. M. Ball, a liveryman at Devil's Lake, N. D., and C. A. Stottler, of Grand Forks, have formed a partnership and will conduct a garage at the former place.

B. I. Blanchard, of San Diego, Cal., will erect an automobile and bicycle shop in State Street.

The Brown Auto Top Company, of Philadelphia, has established a general automobile repair shop at the Belmont Avenue entrance to Fairmount Park, and which will be run in connection with the Belmont garage.

Harry J. Beebe and Chas. Haigh, of Alpena, Mich., have gone into partnership and will open a garage in that place. They will do a general repair business, carry a line of sundries and act as agents for several cars.

The Bergdoll Motor Car Co.'s new quarters at 249-251 N. Broad St., Philadelphia, were recently opened. This company holds the agency for the Benz, Berliet, Imperial and Welch cars.

The Columbus Auto Supply Co., 342 South High Street, Columbus, Ohio, has been formed by F. A. Cromley, E. P. Schopper, Jr., G. Schwendler and W. R. Clark. The business will be managed by Cromley.

The Connersville Automobile & Supply Co., Connersville, Ind., will erect a one-story 40x105 foot garage.

Coombs & Hagan, South Fourth Street, Salt Lake City,

Hosted by Google

enth St., between 2nd and 3rd Aves. The structure will e 40x100 ft. and will consist of a large basement and main oor. The building will cost $5,000.

Elmore Motor Car Co. will open a garage on Euclid ve., Cleveland, Ohio.

The Fawkes Auto Co., at 113 Sixth St., Minneapolis, linn., has acquired the store adjoining for the purpose of sing it as a display room.

Carl Fisher, of Indianapolis, Ind., will erect a large arage at Capitol Ave. and North St. It will be a building 2x135 ft. in dimensions, with 3800 ft. of floor space, and ost from $25,000 to $30,000. It will be three stories igh, steel and concrete construction, and fireproof thruout.

C. W. Henzler will carry on an automobile livery and arage business in the Philbrick Building on Broadway, ismark, N. D.

S. B. Hoelsey, of Leigh, Neb., is remodeling the build- ng adjoining the post office for the purpose of opening garage.

The Indiana Auto Co. expects to erect a new garage be- ore the end of the year. At present it is handling the eerless, Autocar, Thomas and Franklin cars.

Webb Jay has moved into his new quarters in the Har- ester Bldg., Michigan Ave. and Harrison St., Chicago, here he will handle in addition to the Webb Jay steamer e Stanley steamer and the Kisselcar, also the Acme.

The Johnson Automobile Co. has taken a five-year lease n the Binford & Snelling storeroom at 122 East Main t., Marshalltown, Iowa, where it will conduct a garage nd repair shop.

George P. Jones, South Main St., Findlay, Ohio, is hav- ng a 30x40 ft. addition built to his garage.

W. L. Hibbard, formerly president of the Hibbard Auto- nobile Co., has formed the W. L. Hibbard Motor Car Co. nd secured the agency for the Thomas-Detroit 40. Mr. Iibbard is located at 448 Milwaukee St.

The Kansas City Automobile Dealers' Association, Kansas ity, Kan., at its annual meeting elected H. E. Roodledge s president to fill the vacancy made by resignation of . B. Doddridge.

H. J. Kohler Co., of 845 Broad St., Newark, N. J., has rected an up-to-date garage, 50x100 ft. The building of reinforced concrete and all the most modern appli- nces are fitted.

H. J. Kellman, of Litchfield, Minn., will establish a arage and auto livery in connection with his machine hop, to be known as the Litchfield Garage and Machine hop.

J. W. Mason, Newark, N. J., will erect a new two-story arage at 350-352 Halsey St., which will be ready for ccupancy by April 1st.

The Motor Specialty Co. announces that it has moved nto new quarters on Automobile Row, 239 Jefferson Ave., etroit, Mich., where it will handle a complete line of uto and marine engines, launches, etc., etc.

Johnson & Cickey, of Cherokee, Iowa, are building a arage to be known as the Northwest. They will act as gents for the Franklin.

Alfred W. Norris recently resigned as manager of the Norris Auto Co., and has become identified with the sales epartment of the Buick Motor Co., of Flint, Mich., where e will take charge of an important department.

The Pope-Hartford agency in Buffalo has been trans- erred from the Imperial Motor Car Co. to Mr. John J. Gibson, of the Buffalo Auto Exchange. Owners of Pope- Hartfords will be taken care of in the way of repairs and arts at his garage, 401 Franklin St.

Prothero, R. W. & Brother, will open a garage in the ear of Moeller & Sons' Wagon works, Baraboo, Wis., until new building can be erected for them.

Work on the garage of R. G. Running, on East Oak St., etween 2nd and 3rd Sts., Portland, Ore., is progressing apidly. The garage is being built of brick and will be 5x100 ft. in dimensions and cost $3,000.

The Salem Auto Garage Co., of Salem, Ohio, will make dditions to its present quarters in the shape of a repair hop and display room. The addition will be made to the ear of the building now occupied on Ellsworth St.

The Santa Rosa Cycle Co., Santa Rosa, Cal., on B Street, re erecting a 46x150 ft. garage. The frame of the building will be of steel, with a galvanized iron roof and sides f stone-faced prest steel.

A one-story brick garage is being constructed for the Sears-Nattinger Automobile Co. at 10th and Locust Sts., Des Moines, Iowa. It will be 132 ft. square, of brick con- truction and will be the largest garage in that city.

The St. Paul Motor Vehicle Co., of St. Paul, Mich., has ecently completed its 78x169 ft. concrete garage. The tructure and ground is estimated to cost $110,000.

J. B. Terry & Co., Cedar Rapids, Iowa, engaged for a umber of years in the electrical business, are enlarging

rights for Ramsey, Dakota, Washington, Onoka and pin counties with the Lambert machine.

The Akron-Williams Tire Vulcaniz

We show herewith two types of canizers manufactured by the Akron P matic Tire Co., of Akron, Ohio, one vulcanizing outer shoes and the other inner tubes. The tire vulcanizer wil commodate all sizes and styles of t Each compartment consists of three arate and distinct steam chambers for purpose of vulcanizing any part of the desired, thereby eliminating the possib

produce a simple and efficient device calc
lated to give long-continued, satisfacto
service without requiring much attention.

The gear teeth are cut involute and a
said to be free from back lash.

The Dickerson Rotary Air Compressor.

A free running fit is provided in the tw
cylinder and heads. The packing is
liquid of good lubricating quality, havin
high and low temperature values. Th
packing is admitted continuously in sma
quantities, and is sufficient at all times
cover the working parts with a thin fil
serving the dual purpose of lubricant an
packing.

A receiver tank is provided for the pu
pose of holding the air and collecting th
oil that is carried out of the compresso
with the air; this oil gravitates to the bo
tom of the tank and is carried back to th
compressor under air pressure, through
small pipe from the bottom of the tan
A continuous circulation of the packin
lubricant is thereby automatically mai
tained. As considerable oil may be place
in the tank, it becomes at once the rese
voir for both air and oil.

High grade ball-bearings are used, co
sequently no wear can take place betwee
the revolving gear and the cylinder su
faces. The ends of the gear and head
having slight clearness, the end pressure
are balanced and kept tight with oil unde
pressure, and it is therefore evident tha
little wear can occur.

The recent inaugural dinner of the Berg
doll Motor Car Company, Philadelphia, hel

A Phase of Motor Delivery Service

By E. S. FOLJAMBE

It is very evident to those intimately connected with the manufacture, sale and use of commercial vehicles, that the vast majority of merchants who have equipped their establishments with a motor delivery service, or even with an individual machine are entirely ignorant of the fundamental facts, a knowledge of which is necessary in order that the service shall be conducted on anything like an economical basis or compete with that of horse drawn delivery.

Fortunately for the future of the commercial vehicle this state of affairs naturally improves with time, but any system which will relieve the timid and uninitiated merchant from the responsibility of inaugurating and caring for a motor delivery service, will materially aid the rapid introduction of power delivery vehicles. A system which fulfills these conditions has been organized in Philadelphia by Mr. P. Prouty of The Motor Commercial Delivery Co., 1518 Appletree street.

Briefly, this system makes it possible for the merchant or tradesman who desires to use motor cars for delivery work but realizes his shortcomings in regard to the best methods of purchasing, maintaining and operating such machines, to have all the benefits of such delivery without any of its disadvantages. In other words, it takes from him the entire responsibility of the cars and the uncertainty of the cost of their maintenance and in its stead, sets a fixed and definite amount as the cost per year.

The merchant simply signs a contract in which it is agreed that for certain considerations cars will be supplied him, properly maintained by a competent corp of mechanics, and even the chauffeurs engaged and paid by the company furnishing the cars. It is believed that this system will bring about in the near future, a much larger use of commercial vehicles, as it guarantees to the merchant 50 miles per day of actual delivery service for each machine, entirely relieving him of the uncertainty attendant upon such an enterprise. The contract also contains a clause by which the user is required to pay a certain amount per mile for each mile over 50 per day made by the vehicles, the same being determined by odometer readings. The user has no interest whatever in the chassis but is allowed to furnish various types of bodies according to the service. These may be appropriately painted with the advertisements of the merchant's goods, but beyond this the merchants' interest in the vehicle ceases. Everything devolves upon the operating company so that if a machine fails at any time, means are taken to see that the goods reach their destination in the quickest possible space of time, regardless of the number of vehicles it may be necessary to use in order to accomplish this end. Of course, it is seldom necessary to send an auxiliary vehicle and transfer a load to it for delivery, from a stalled machine. This does not happen nearly as often as with the cars of many merchants who are using a large number of machines and caring for them themselves simply because these machines are always kept in condition.

The following are some of the methods employed by commercial vehicle users, which sooner or later cause them trouble and largely increase the operating cost of their delivery service. In the first place, the manufacturers of the trucks themselves are partly to blame as they usually hold out the inducement to a possible merchant purchaser, that each and every one of their machines will step in and do the work of three horse drawn vehicles, and this irrespective of whether one, two or a dozen machines are used for delivery purposes. Now, it is well known that where only one or two machines are used, that for 365 days in the year they will not average the work of six teams, altho better methods are gradually bringing a nearer approximation to this desired result. The merchant, however, believing he is going to obtain this kind of service, disposes of his horses and wagons, takes his handy man from about the store who is somewhat mechanically inclined, and puts him in charge of the new installation, altho he has probably never had any experience whatever of this nature.

An attempt is made at once to make each machine cover as large a territory as possible with just as big a load as can be placed upon the platform. Both machines

Hosted by Google

are usually run continuously without any relay system or periodical overhauling. This, of course, sooner or later results in an unfortunate breakdown, which very often lays up both machines at about the same time, and if the merchant has discarded his horses entirely, as is often the case, the situation is anything but advantageous for the motor delivery business. The excessive speed at which the machines are operated, as previously pointed out in these columns, is another feature which very often leads to trouble and is partly the fault of the makers, not only because the trucks are geared too high, but because the factory demonstrators are very apt to endeavor to show off the new vehicle by covering just as large a territory at as high speed as possible. Another feature which makes it difficult to successfully install a new service is the fact that the shipping department must in reality be entirely reorganized to fit the new conditions, and unless a man is placed in charge of this reorganization work, who is thoroly familiar with motor delivery service, the process usually results in a total demoralization of the previous shipping system without its place being filled by a systematic method suitable for use with the new type of delivery.

DRIVERS.

The drivers are one of the most vital elements in connection with the success or vehicles are placed at their disposal under failure of such a service. If they have no responsibility in the matter and are simply paid a salary, in nine cases out of ten trouble will surely follow. One of two extremes is usually followed,—either the very cheap, incompetent man is employed or else a high priced mechanic. In the first case, the truck usually suffers from abuse and neglect the result of which more than offset the low wages of the driver. In the second case it very often happens that the driver considers himself above the menial work attendant upon a servant's position and will not load and unload and attend to other as necessary duties, and a high priced helper is necessary which runs the expense beyond what can reasonably be borne. All of these details must be learned from experience by the user and are a few of the most prominent factors which deter the universal adoption of motor driven delivery vehicles.

A NEW SYSTEM.

The system which forms the basis of this article does away entirely with all of these disadvantages. In the first place vehicles were put into service in as many and varied lines of work as possible in order that the shortcomings and peculiar requirements of different classes of delivery might be ascertained. Various types of vehicles were also employed, each being as far as possible suited to the work in hand, and a large amount of useful data has thus been accumulated.

In this new system of handling the delivery problem some of the methods employed are unique and deserve special mention. The drivers are made responsible for everything that happens to the car under their control and are required to pay a certain amount for each breakdown and even 20 cents for each puncture sustained. This amount is deducted from their weekly wages, which would amount to $18 per week being $3.00 per day provided they have no breakdowns. At first sight, it would appear that in some cases injustice might be done the individual driver, but this matter has been so nicely adjusted and other facts which will be brought out later are so brought to bear on it, that in the long run it results in a permanent position for a careful man, and the company states that they have no difficulty whatever in securing operators. Each driver, during a period of a certain number of weeks must average $17 a week as his salary, or he is discharged as being too careless and this has resulted in the elimination of all undesirable help.

These men are not mechanics, nor is any attempt made to make them such. They are usually recruited from the farming districts and are trained to become nothing more than careful drivers. They never repair the cars further than making slight adjustments upon the road, all repair work being systematically performed by a corp of competent mechanics under the supervision of an experienced foreman. Each car, after a certain distance has been traveled, is retired from service, whether its driver thinks it needs it or not, and is thoroly overhauled and put into as perfect condition as possible. Thus no machine is called upon to do extra work and periodically passes thru the shop. In this way many incipient defects which might otherwise result in future breaks are noticed and corrected. Thus it will be seen that the breaking of a part, the average life of which is well known in other rigs of the same make and doing the same service, unless flaws or other defects are shown, is pretty conclusive proof that the machine has been subjected to unnecessary strains, such as produced by excessive driving over rough pavements or butting curb stones or exposed car tracks, so that no injustice in the long run occurs to an individual driver. Even the matter of punctures, which is shown to result in preventing drivers who have wasted time at saloons or other places from taking short cuts across lots or thru alleys where broken crockery or other things might be encountered which would damage the tires.

AVERAGE WORK OF EACH CAR.

Each machine is made to cover much more than 50 miles per day and will average for a 1½ ton vehicle upward of 700 stops. This large number of deliveries per day is made possible by a special system

Hosted by Google

and carefully laying out the routes. For example, a boy is carried with each car and the routes are so thoroly known and so well planned that this helper with a certain number of parcels to be delivered within a short walking radius is dropped off while the truck goes on delivering to other places, the whole being so timed that less than five minutes on an average is lost on the return in picking up the helper. All of this planning is done by a person in the employ of the delivery company whose duty it is to gradually reconstruct the shipping department of the store using the trucks. This man is so thoroly acquainted with the capabilities of the machines, their individual drivers and the general needs of the service that he is able to divide the territory to be covered into such routes that the least possible time will be wasted and the smallest possible distance have to be traversed. Each machine on an average covers from 1500 to 1600 miles per month during the busy season. Two routes are sometimes combined in such a way that a single machine at times can cover both, thus saving time and expense.

DRIVERS' MOVEMENTS CHECKED.

An accurate record of the number of stops required on each trip is recorded and it has been found possible to very closely check the movements of an individual machine by means of the accuracy of this system. In addition, each driver is required to turn in a report on a printed blank, this having to check with the superintendent's report, this double check making it possible to detect irregularities in the service. Under these conditions it is impossible for drivers to attend baseball games or waste their time without being found out. The strictest of regulations in regard to appearing on time in the morning and having their trucks ready for loading are adhered to, a system of docking for laxness in this respect being used. However, at the end of each year of service a bonus, based upon the kind of work he has done for the company during that period is given to each driver. No arbitration is used with the chauffeurs, everything being settled indisputably by the office, and this regulation, which is agreed to by each employee, has saved much trouble.

STOPPING THE LEAKS.

The repair work is systematized to the same extent as the delivery system. A blacksmith shop, machine shop and a general overhauling room constitute the repair department and it has been found that very few parts have to be machined. To reduce to a minimum the cost of operation certain devices originated by Mr. Prouty, which have been found to be more economical, have been installed, such as a simple form of timer, which, instead of having the large number of points of resistance for the current usually found in devices of this nature, has cut this down to about one half, thus saving current. This may appear to some to be a very minor detail, yet with a large number of machines operating the year round, these are exactly the kind of leaks which must be controlled in order to make the service pay. Furthermore, it is just such small details which are entirely ignored by the average commercial truck user. Gasoline, oil, batteries, etc., are carefully watched and checked and no waste allowed. Drivers are not allowed to drive in the car tracks except when absolutely necessary. Long overhanging rear bodies on machines with comparatively short wheel base are believed to be bad, resulting in an uneven distribution of the load and extreme wear on the tires. More work can be done with the same machine with the wheel base lengthened and the load more equally divided on the front and rear wheels and the tire expense is much less. Large trucks of three tons or over are not believed to be as efficient as a larger number of smaller machines whose total carrying capacity is the same, but this, of course, varies with the type of work.

EDUCATIONAL NATURE OF THE WORK.

The entire system is educational in that merchants are instructed in the best manner of using commercial vehicles. The dle to be placed in any position over the the best of conditions for obtaining the maximum amount of return and the users are gradually educated to the point where they realize the value of such a service and also see what changes are necessary in the shipping and other departments for successfully using this means of delivery. Thus it is possible for a merchant to gain all of these advantages without personally going to the expense of owning the trucks and spending money unnecessarily gaining experience. Merchants are educated to purchase suitable types of machines for their particular class of work and not to choose from external appearances or pick out what might be termed dainty delivery wagons, but to choose vehicles the chasses of which are adapted for the purposes intended.

A combination of interests or a sort of co-operative employment of commercial vehicles is the ultimate end in view, there being a central garage in an accessible location at which the different merchants' cars are maintained, this system, of course, making it possible to cut down appreciably the maintenance budget and more firmly establish the use of motor driven vehicles for delivery purposes.

The Elmore Mfg. Co., Clyde, Ohio is said to be making a lot of 50 two-cycle gasoline cabs for use in Chicago.

ck to Practical Designs and Eliminate Mere Talking Points

According to the report of Mr. W. F. ong, proprietor of the Death Valley to Co., Greenwater, Cal., he can do more rk with one automobile than three ms. He has been in the commercial toring field for the past five years both himself and others, and declares that chief trouble is in the operator and in the car itself. Mr. Brong has some ical opinions regarding the vogue in building and after buying a car he alys overhauls it and throws away at st one-third of its parts, which he ims are useless and only put on to get xing points for salesmen.

Brong is a reliable ignition system at minimum cost. Mr. Brong states that wi the car he can do as much work in one d as the team in five. In other words, says he can haul 120,000 lbs. per month a cost of $300 against 3-6 horse outfit co ing $900 per month; the auto clearing $9 as against $360 cleared by the horse o fit. Another item in favor of the car the maintenance expense which when t car is idle, does not amount to anythi According to Mr. Brong's idea a machi for his business should cost not more th $1000 and should not cost more than $3 per month for maintenance. In regards the construction of such a car, Mr. Bro says: "The trouble is no one makes su a car and the constructors have not had t

Mr. W. F. Brong in His Overhauled Car, Transporting Mail in California.

Mr. Brong's business includes everyng in the way of transportation, such forwarding mail, express, baggage, ight and passengers. For the past year has been using an old second-hand car t he bought for $500, the original cost which was $3500. This car is of the ylinder water-cooled vertical engine e, and rated at 30 H. P. The average d hauled weighs from 1800 to 3000 lbs. l 50 to 100 miles are covered daily. e average monthly cost of gasoline is and of lubricating oil $2.50. No exses are incurred for repairs, storage, pers or operators, as Mr. Brong runs l cares for the car himself. The car laced 6 horses and 3 vehicles, thus also ting out the expense of two drivers. out 15 miles per day were made by each m. The horses cost $150; harness $35

actual experience. If such a manuf turer should get the right idea and sti to it and turn out a low-priced car t Humane Society would be a thing of t past and all transportation would be se propelled. However, the present state affairs will continue as long as the man facturers look to their agents for adv on construction. The salesman deman that there shall be some change made eve year that he may have a talking poi For instance, there has been many chang in the clutch, but no improvement; the cone is still the best and most serviceal if used properly. I have started 10,0 lbs. with a 30 H. P. cone clutch."

Grocery Concern Reduces Haulin

ence with commercial cars, have given us some very interesting information on the subject, at the same time stating that they are entirely satisfied with their machines which have innumerable advantages over horse-drawn vehicles.

They have in use two trucks, one of which has been in continuous service since September 1st, 1906, and the other since September 1st, 1907. Both trucks are of the Four-Wheel Drive Wagon Company's make and cost $4000 each. The motors are of the 4-cylinder vertical type and set under the driver's seat. As no odometers are fitted to the machines, no data re-are fitted to the machines, no data regarding the mileage can be given, but only the tonnage, which it is claimed from September 1st, 1907, to January 1st, 1908, amounted to 5480 tons of freight hauled for the two machines. If hauled by horses this would have cost $1918, the rate being 35 cents per ton. The expense of operating the trucks is as follows: Two drivers at $50 per month, $400; 2075 gallons gasoline at 12½ cents per gallon, $259.37; 55 gallons of lubricating oil at 56 cents, $30.80, and expense for heavy oils and grease, approximately $10.00; or a total of $700.11, which deducted from $1918, the possible cost by teams, leaves a net balance for four months of $1217.89 in favor of motor hauling. At another time this concern states it has pulled in one day 120,000 lbs. with one truck, which if figured, at 35 cents per ton, for cartage expenses, would have cost them with horses $21.00. Fuel consumption has never exceeded 10 gallons per day and their daily expense for lubricating oil never exceeds 25 cents.

As to depreciation and wear on the machine, the Allen Company has made no deduction for this item, stating that upon careful examination of the vehicles no material wear has been noticed other than the tires. These are of the wood type, and are conservatively estimated to last for 12 months of continuous service. They operate their trucks every day in the year and do not keep them under cover at all, but leave them standing in front of their store every night. They figure that each truck takes the place of from three to four teams. Altho the trucks are nominally rated at 7 tons capacity, the company claims to have put on 14 or 15 tons load without distressing them in the slightest. The company states that on small loads and outgoing freight, the showing is not nearly so good—in fact, there is no money in them at all. They must be loaded heavy to make them pay, as they are slow-speed machines, intended for heavy work. They employ a competent mechanic who makes all repairs and adjustments that are necessary. This concern thinks that the only way the automobile truck can ever successfully displace horses in a commercial way is for any firm using them to have one machine in excess of their actual requirements so that they will never be delayed in case they have to lay up their truck for repairs.

(We cannot vouch for the figures contained in this article further than that they were returned to us as correct after having been sent back to the company in question for verification.—Ed.)

A Case of Operator's Carelessness

That it is not always the car to blame but sometimes the fault of the operator is well illustrated by the experience of the Auto Transportation & Sightseeing Company, Savannah, Georgia. This concern employs three cars, for sightseeing and pleasure riding purposes, two of which are 16-18 horse-power Packard cars, with 2 cylinder vertical motors under front seat and costing $3200 each, while the third is a 4-cylinder Ford touring car.

The Packard cars have been in use for 18 months. One trip per day is made with about 5 calls per trip covering an average of about 20 miles. About 8 miles are figured to a gallon of gasoline and about 75 miles to a gallon of lubricating oil. $60 to $75 are paid per month for operators' wages and $30 to $45 per month for helpers. This concern does its own storing. The cars are figured to depreciate one-third in value each year, or in other words are expected to last about three years.

In regards to improvements needed in motor cars, this company states they are two numerous to mention. It seems this company is having all kinds of trouble in securing competent drivers, its usual luck being to get persons who are careless, indifferent, and lacking in sufficient moral principle to properly care for a car. This concern considers the horse more reliable than the motor car, and the help more efficient and careful, perhaps on account of caring more for actual life, but thinks the car better for distance and speed. The 4-cylinder Ford touring car is rented out at $4 to $5 per hour, but in the past 6 months not a cent of profit could be figured all due it is said to the driver's indifference, carelessness and to tire expenses.

Motor 'busses now run through the night in Paris, as all night street car service has been suspended. The machines do considerable business.

Max Gabrowsky has resigned his position as manager and designer of the Rapid Motor Vehicle Co. and has organized the Gabrowsky Power Wagon Co., at Detroit, Mich., with which he holds a similar position. His first model will be ready May 10 and will be described in an early issue of the Journal.

be assembled. For the present the entire out is being sent to Chicago, where Mr. n H. Fay intends to install the first icab service to be put in operation in the ly city.

hese Taxicabs are built over the same truction used in the Elmore Thirty, h is the three cylinder, two cycle valve- car built by the Elmore Manufacturing pany. The cab is an exceedingly light weighing less than 2,300 pounds. The ne develops 24 horse power and is geared o 1, so that a speed of from 4 to 30 miles hour is easily obtained. It is claimed e one of the roomiest cabs yet put out. ne inside height of the body is 60 inches the inside width is 40 inches. From

New Two-Cycle Elmore Taxicab. The chassis is practically the same as that of the Elmore 30 and is fitted with ylinder, 2 cycle engine of 24 H. P. The wheel base is 102 inches. The front and door windows are of drop patter e finish is in dark green. Either leather or cloth upholstery is applied. The top, of laudaulet pattern lets dow an open body.

ront seat to the back cushion is 45 inches. loor is 22 inches wide and 54 inches high. distance between the back of the front nd the front of the rear seat is 27 inches he extreme height of the body from the d is 90 inches. Three people can be conveniently seated in the cab, while eople have plenty of room and to spare. top, of landaulet pattern, lets down, g an open car.

e upholstering is furnished either plain biscuit pattern, in either cloth or leather. quality of both covering material and l hair is used. The cushions are all length and are built on the best quality

Taxicab and the regular stock chassis is fact that the wheel base has been shorten slightly, it being but 102 inches. This mak the car very easy to handle as it can be turn around in the average street without havi to back.

Demonstration of Alcohol as Fuel f Heavy Trucks

The Hewitt Motor Co., recently made demonstration of alcohol as fuel in one of 5-ton gasoline trucks, from its salesrooms East Thirty-first St., New York City. N changes were made to the vehicle with th exception of placing a hot water jacket aroun the intake manifold, and raising the com pression of the motor from 78 to 112 pound by using longer pistons with dome shape heads. The motor is rated at 32 H. P. an has four cylinders $4\frac{1}{4} \times 5\frac{1}{2}$ inches. The firs day's run with a 1000 lb. load demonstrate the flexibility of the motor, which could b run fast or slow with as much ease as if gaso line were used. Other runs made later with full 5-ton loads showed that the change o fuel did not lessen the capacity of the truck

Motor Cars Better for Hauling Gas Tanks

The Prest-O-Lite Co. of Indianapolis, Ind., well known as the makers of the famous "Prest-O-Lite" comprest gas tanks, find it advantageous to use motor cars in place of horse drawn vehicles and they now have one Premier, 4-cylinder, gasoline car doing the work of four horses and two wagons previously used. The car has a carrying capacity of 1,500 pounds and makes a daily average mileage of 45 which includes about 25 short trips within a radius of four miles. They care for the car in their own garage and they pay the operator $80 per month. No separate account of lubricating oil and gasoline has been kept, hence no definite figures covering these items are available. Repairs

cost of caring for and feeding, $12 to $ per month for each of the four hors $3 per month for shoeing each horse a $45 per month for each of the two drive The depreciation of horse value was re oned at 20 per cent per year and of vehicles at 10 per cent per year.

"That there are not yet enough types cars, particularly commercial vehicles, the market, is every day more evide said Mr. Harry Levey, a young busin man of large interests, who has beco identified with motor racing. "I am in market for thirty-two light, gasoline de ery cars, capable of a carrying capacity fifty-four cubic feet, but of not necessa more than 200 pounds, besides the driv The ideal car for my purpose would h

MOTOR CYCLE DEPARTMENT

No "Exhibition" Motorcycle Races

The Federation of American Motocyclists thru the chairman of its Competition Committee, Roland Douglas, has very clearly expressed itself in the matter of so-called "exhibition races," such as the "contest" perpetrated at Kansas City at the close of the recent six-day bicycle racing.

"There is no such race as an 'exhibition race,' " says Mr. Douglas. "In such events the results are fixed and prearranged, and are therefore dishonest. Such a race is a fraud on the public. As an 'exhibition race' is a fixed race, that form of sport must be stopped, and we mean that it shall be stopped, whether the men involved are amateur riders, professional pace-makers, or plain, ordinary, every day fakers."

New York and the F. A. M. Meet

It seems a foregone conclusion that the 1908 annual meet of the Federation of American Motorcyclists will be held in New York, during a week to be determined later, but which will doubtless either be the week of July 4th or the final week in July.

No other competitor for this honor has made an earnest effort for recognition, so New York is likely to get the sanction by default. The metropolis, in the persons of its motorcyclist enthusiasts, is preparing to make the meet the greatest in the history of the new sport.

Motorcycles and the Post Office

While many motorcycles are used by the carriers on Rural Free routes the post office department requires each carrier to apply for permission before buying or using a machine. It seems that the department regards a carrier's time schedule as something that is almost sacred. A man may jog over his route in five hours with a horse, and cover the same distance in two with a motorcycle. But the department wants to be certain that the schedule, whichever it is, will be religiously maintained. For that reason, the use of motorcycles is ordinarily permitted only when they can be in operation at least eight months in the year.

Motorcycles for Fire Chiefs?

Judging from the letters of inquiry received by an eastern manufacturer of motorcycles, at least one fire department in the United States is seriously considering the purchase of one or more machines. It is believed that for the use of a chief, or assistant chief, much better time can be made in getting a commanding officer on the scene of a fire than is now possible with a swift steed and chief's buggy. Experience with motorcycles and automobiles for fire service has proved a complete success in several foreign cities.

Motor Cycles for War Purposes

A most unique bequest is reported from Denmark, to the effect that a wealthy citizen has left his entire fortune to the government, for the purpose of forming a motor cycle corps, which shall be an adjunct to the Danish Army. It is proposed to equip the new contingent with one hundred motor cycles, each of which will carry a light machine gun capable of firing 500 shots per minute. This will be the first regular army motor cycle corps in the world.

Irvington Race to be Again Run

According to the announcement made by the Bay View wheelmen, the historic Irvington-Milburn 25-mile bicycle road race will be held on Decoration day, May 30. Wm Rouff is chairman of the race committee. The race will be started at 11 o'clock in the morning as usual.

1908 F. A. M. Meet

At the first meeting of New York motor cyclists in Parlor A of the Grand Union Hotel, New York City, held for the purpose of bringing the Federation of American Motor Cyclists' national meet to the metropolis, great enthusiasm was shown, workers were chosen, officers elected, and money subscribed. Nearly $1,000 was raised before the meeting adjourned. The officers of the F. A. M. meet club are as follows: President, R. G. Betts, of the New York, Brooklyn, Boston and Providence motorcycle clubs; vice-president, L. H. Guterman, Harlem Motorcycle Club; secretary, Henry J. Wehman, Brooklyn Motorcycle Club; treasurer, David Dessau, New York and F. N. Motorcycle Clubs.

nticipating some time ago the proba-
y of a big demand for two-cylinder
orcycles, Hendee Mfg. Co., of Spring-
, Mass., makers of the well-known In-
machines, as early as 1904 began de-
ing and testing out twin-cylinder In-
s and are therefore well equipt to meet
big demand that has developed this
on. The Hendee Company have fac-
facilities for turning out 100 twin-
nder Indians per week and are offer-
two models of this type, one a 5 H. P.
hine listing at $250, here shown with
neto attached, and the other a 7 H. P.
r.

elieving the term horse-power, as com-
ly used in claiming engine ratings, to
deceptive, the Hendee Company has
ugurated the practice of rating its en-

be depended upon nor any varying sprin
to alter the proportion of the charge. Th
feature can readily be applied to all prev
ous Indian models, and at slight cost.

Another feature of the 1908 Indians
an oil gage in the motor base, enabling th
operator to know exactly how much oil
in the base and guarding against runnin
the engine dry.

In response to a popular demand f
magneto ignition, the Hendee Compan
gives an option on this form of ignitio
on all 1908 Indians. The extra cost f
magneto ignition is $40 and the Bos
magneto is used. It is placed on a sp
cially designed platform directly in fro
of the motor base, and connected to th
make and break shaft by three enclos
gears. The accompanying cut shows th

One of the chief features of the latest "Erie" bicycle attachment is the fact that he motor is of the 2-cycle type, which, ecause of its lightness and simplicity, nakes it an ideal means for converting he ordinary bicycle into a power-driven nachine. This attachment is the product f the Motorcycle Equipment and Supply Company, 3 Lake St., Hammondsport, N. Y., nd is sold either separately, all ready for ttaching to the bicycle frame, or in the hape of a complete motorcycle. The atachment fits any size or make of frame nd is attached without a particle of alteraion to the bicycle frame, except slightly ending the narrow makes of cranks. The Erie attachment gives a speed of from 4 to 0 miles, and is controlled by means of one ever, the movement of which increases or ecreases the speed as desired. The tank s made of heavy tin and holds gasoline for 0 to 110 miles, and enough oil for 100 to 50 miles. The battery case is made to old three standard dry cells. The drive

The accompanying cut shows the Ec belt pulley idler for motorcycles, manu tured by the Eclipse Machine Comp Elmira, N. Y.

868	Returned by News Company, to May 16th, 1908.
16,892	Net total paid.

We print on this page each month an exact statement of the number of copies printed and distributed of the preceding issue of "The Cycle and Automobile Trade Journal."

The bindery count of actual complete copies produced of the May issue was 20,436.

Of these, 21,536 pounds were mailed at pound rates, as shown by post office receipts. Each copy weighs 24 ounces, representing 14,357 copies, and 777 copies of back numbers and copies returned by news companies are accounted for, in addition to the total for the month.

We will be pleased to verify the above figures at any time to any one interested.

Forcing the officials to postpone the Algonquin Hill Climb three times on account of rain, the weather man finally won a victory over Chicago motorists and caused them to set the contest for August 14. The entry list will be kept closed and no other contestants will be allowed to enter other than those who had qualified for the original date, May 15.

Coming Events

American.

June 6—Second Annual Hill Climb, Williamsport, Pa., Williamsport Automobile Club.

June 6—Hill Climb on Dead Horse Hill, Worcester Automobile Club, Worcester, Mass.

June 13—Annual Hill Climb of the Cleveland Automobile Club, Cleveland, Ohio.

June 20-26—McClure Cup Contest in conjunction with annual run of the Albany, N Y., Automobile Club, John Randerson, chairman of committee in charge.

June 24-27—1200-Mile Reliability Run, Chicago to outlying points and return. Chicago Motor Club, C. P. Root, chairman contest committee.

June 25-27—Third Annual Summer Meeting of the Society of Automobile Engineers at Detroit, Mich.

June 27—Hill Climbing Contest on Skippack Hill, Norristown, Pa., Automobile Club.

June 29-30—New York City, Federation of American Motorcyclists' Annual Endurance Contest.

July 1-4—Federation of American Motorcyclists' Annual Meet, at New York City.

July 4—200 mile stock car race, in Lowell, Mass.

July 6-8—National Convention of the A. A A., at Buffalo, N. Y.

July 8—Start of Glidden Trophy Tour from Buffalo. N. Y. American Automobile Association, F. B. Hower, Buffalo, N. Y., manager.

September 5-9—San Francisco-Los Angeles Reliability Run, under auspices of the Automobile Dealers' Association

September 14—Annual Economy Run. Chicago Motor Club.

December 31-January 7—A. M. C. M. A. Annual Automobile Show at Grand Central Palace, New York City.

1909.

January 18-23—Annual Automobile Show in Madison Square Garden, under auspices of Association of Licensed Automobile Manufacturers, 7 E. 42d St., N. Y. City.

February 1-6—Chicago National Automobile Show; National Association Automobile Manufacturers, N. Y. City, S. A. Miles, manager.

Foreign.

June 1—Beginning of Alcohol Engine Competition, under auspices of Automobile Club of France.

June 1-8—Pleasure Car Reliability Trials. Automobile Club of Great Britain, London, England.

June 9-17—Touring Competition for Prince Henry of Prussia Cup, Germany, Imperial Automobile Club of Germany.

June 14—Mount Cenis Hill Climb, for Voiturettes.

June 15-19—Scottish Reliability Trials for Touring Cars.

June 18-21—Reliability run under direction of the Austrian Automobile Club.

July 7—Grand Prix Contest, Dieppe Circuit, France, A. C. of F.

July 13-17—International Race Meet, Ostend, Belgium, Automobile Club of Ostend.

July 20-30—Ardennes Circuit Races and Coup de Liederkirke, Automobile Club of Belgium.

August 29-30—Mont Ventoux Hill Climb, France, Vauclusien Automobile Club.

September 1-8—L'Auto's Contest for Voiturettes, Paris.

September 6—Bologne, Italy, Florio Cup Race, Automobile Club of Bologne.

October 2—Speed Trials of Royal Automobile Club, Isle of Man.

October 11—Third International Balloon Contest, to start from Berlin, Germany.

December ——Eleventh Annual Salon de l'Automobile Grand Palais, Automobile Club of France, Paris.

Hosted by Google

Glidden Route Altered

Buffalo, Pittsburg, Philadelphia, Albany and Boston will be the four largest cities touched by the American Automobile Association's touring contest for the Glidden trophy this year and they will be reached in the order named. New York City will not be entered and New Jersey soil will not be touched during the tour. The route has been changed so as to include Philadelphia and avoid New Jersey. The reason for eliminating New Jersey from the route of this year's tour is the sand-bagging motor law of the state. It was originally planned to run from Philadelphia to Atlantic City and spend Sunday at that resort, but as it would have cost the contestants about $13 license fee for each car, for the two days the state was avoided altogether. From Philadelphia the route of the tour will be through the Delaware Water Gap and by way of Port Jervis into New York and up to Albany. Thence it will go thru the most interesting parts of New England.

The work of laying out the route of the A. A. A. touring contest is now more than half finished and the reports from Dai Lewis, secretary of the A. A. A. touring board, who is mapping out the route are to the effect that generally speaking, the roads are better, the scenery finer and the night accommodations more satisfactory than on former tours. The roads lead over more mountainous country, however, and the time schedule being planned will make the contest a closer one than ever before, which has been the chief aim of Chairman Hower, of the touring board.

The run for each day and the stopping places at night and Sunday, as thus far arranged, are: July 9, Buffalo, N. Y., to Cambridge Springs, Pa., 117.4 miles; July 10, Cambridge Springs to Pittsburg, Pa., 110.2 miles; July 11, Pittsburg to Bedford Springs, Pa., 106.4 miles; July 12, (Sunday) at Bedford Springs; July 13, Bedford Springs to Harrisburg, 107.3 miles; July 14, Harrisburg, Pa., to Philadelphia, 133.5 miles; July 15, Philadelphia to Milford, Pa.; July 16, Milford to Albany; July 17, Albany to Boston.

From Boston the tour will go up into Maine, back into the White mountains and probably disband at Saratoga on July 22 or 23. The details beyond Boston will not be settled until after the pathfinding trip is completed.

Entries for the A.A.A. reliability contest for the Glidden trophy can be made at any time now, giving only the fee, the name of the car and the entrant. It will not be necessary for entrants to give the names of drivers and observers until the entries close on July 3. Entries are made with Chairman F. B. Hower, 760 Main St., Buffalo. Blanks may be had from him, from Arthur Jervis, 29 West 42d St., N. Y., or from any of the principal dealers.

Buffalo Good Roads Convention

Buffalo will be "wide open" to automobilists during the good roads convention to be held there July 6, 7, 8, under the auspices of the American Automobile Association. Mayor J. N. Adam will formally hand over the key of the city. A lively interest is being taken in this convention all over the country and the attendance is expected to be well up in the thousands. The governors of New York, Pennsylvania and Ohio, the highway commissioners and state engineers of Pennsylvania, Massachusetts and New York, and a long list of other notables will participate in the doings, educational and social. Road runs, speech making, smokers, vaudeville entertainments and highway inspections will vary the program.

A delegation from each of the different state organizations of the American Automobile Association will be sent to attend the National Good Roads Convention, and as there are now twenty-four state divisions, the event will probably be the most truly national, as well as the biggest good roads convention ever held in this country.

Among the demonstrations, entertainments, banquets and oratorical sessions at Buffalo during the National Good Roads and Legislative Convention will be a series of experiments with various dust preventives, such as Westrumite, Tarvia, oil, etc. In these, a 3½ mile stretch of dusty road will be divided into seven sections, on each of which a different mixture will be applied. About two hundred automobiles will be used to test the efficacy of the various dust medicines. Governors, state engineers and various highway officials will be present to learn what they can of subjugating dusty roads.

Under the new rules a state organization of the American Automobile Association can be formed in any state, by 100 individual members of the national body. Applications for an individual membership should be made to Secretary F. H. Elliott, at the executive headquarters, 437 Fifth Ave., N. Y.

The location of the Vanderbilt Cup course is still an open question. Representatives of the Savannah Automobile Club gave it up after numerous conferences with members of the Cup Commission, which appears to be long on agnosticism. The Savannah enthusiasts have not despaired, but state that they are much overcome with A. A. A. red tape. Connecticut is said to be an impossibility, and St. Louis is said to be out of the running. The light upon which the Racing Board's eyes are fixed appears to be the Long Island will-o'-the-wisp.

Hosted by Google

A. M. C. M. A. 1909 Show Date Set for New Year's Eve

After a careful consideration of the interests of the automobile and accessory manufacturers, dealers and the public who buy cars, the American Motor Car Manufacturers' Association has definitely decided upon the dates for its show next winter in Grand Central Palace, New York. The big exhibition will open on New Year's Eve, a gala occasion in New York. This will make the show dates December 31, 1908 to January 7, 1909.

The Importers Automobile Salon this coming December 31 to January 7 will exhibit with the A.M.C.M.A. in the Grand Central Palace, New York, instead of separately at the Madison Square Garden as they did last winter.

E. R. Hollander will represent the Importers' Association to serve on the A.M.C.M.A. Show Committee which consists of H. O. Smith, Chairman; S. H. Mora, R. M. Owen, Benjamin Briscoe, and Alfred Reeves, General Manager.

A. M. C. M. A. Chicago Show in February

At a recent meeting of the Committee of Management of the American Motor Car Manufacturers' Association, held at its headquarters in New York, the Show Committee was empowered to make arrangements for an automobile show under the auspices of the association, to be conducted in Chicago some time during February. This is in line with the policy of the association of promoting its own shows, as in the case of the Grand Central Palace show to be held in New York next winter.

According to present plans, the Chicago Automobile Club and the Chicago Motor Club will be associated with the A. M. C. M. A. in the western show.

Meeting of the Mechanical Branch in Cleveland

In accordance with the policy suggested at the meeting of the Mechanical Branch of the Association of Licensed Automobile Manufacturers, in Chicago, in December, to the effect that the Branch meetings be held at different points thruout the country, in order to give the engineers an opportunity to inspect and study the different factory methods of its members, a meeting of the Mechanical Branch was held at the Hollanden Hotel in Cleveland, Friday, May 22d.

The morning session was opened at nine o'clock, taking up the subjects of proposed standard brake and clutch levers which has been given a certain amount of attention by the engineers and especially the Test Committe for the past three or four months. A full and very interesting report of data gathered by the Test Committee relative to the dynamometer of the Automobile Club of America was given and discussed. There was a paper on the two-cycle motor by E. W. Roberts and A. W. Thompson of the Electric Welding Products Company gave an illustrated lecture on the advantages of combination valves, nickel steel heads and carbon steel ends.

Some of the local factories were visited by the engineers in a body, and factory and shop methods closely studied.

46 in Grand Prix

There are 46 cars in all entered in the Grand Prix, the classic French auto derby. Of these the Bayard-Clement, Brasier, Lorraine-Dietrich, Motobloc, Panhard, Renault represent France; the Fiat and Itala are the Italian entries; the Austin and Weigel are the English entries; the Germain, Ben, Mercedes, Opel and Porthos are the German entries, and the Thomas the American. It will be seen that the American car is to compete against 15 teams of three cars each, of which six are French, two Italian, two English and five German. Preparations are being made with the entrants of cars in the Grand Prix race to have the drivers of the machines familiarize themselves with the circuit at Dieppe to the greatest possible extent. Some of those who will drive in the race were competitors a year ago and this means that the knowledge gained by practice and through the 1907 race ought to make the cars these men will drive minutes faster. The Grand Prix race ought to be more prominent than ever this season. Strang sails from New York on May 10, and will arrive on the course about May 17, and will thus have about two months of practice work upon the course, which will give him a greater advantage than has been the lot of American drivers who have entered the foreign events in the past.

Boston 1909 Show to be in March

It has been decided by the directors of the Boston Automobile Dealers' Association to hold the 1909 show during the second week in March as on previous years. The Mechanics building will be leased as usual, altho there was some talk of another location.

The Fairmount Park Commission, Philadelphia, Pa., has directed Superintendent Vogdes to begin the regular use of terracolio over all the principal driveways in the park. This liquid, which is a composition of asphaltum oil and water, will be sprinkled liberally over the roads once every week or ten days throughout the summer. It is stated experiments have shown that the treatment which costs only a half cent per square yard will save the city money as well as add to the comfort of the public.

Automobile Club of France Protests Vanderbilt Cup Race Rules

The Automobile Club of America received the following letter from Honorable Chv. Rene de Knyff, President of the Commission Sportive, Automobile Club of France, protesting against the proposed rules for the Vanderbilt Cup Race to be held in the year 1908.

AUTOMOBILE CLUB OF FRANCE,
8 Place de la Concorde, Paris, France.
April 18th, 1908.

President of The Automobile Club of America, New York.

Mr. President.

The Contest Committee at their meeting on the 17th instant took notice of the proposed rules for the Vanderbilt Cup Race for 1908, as same were published in the different journals. I believe it is proper to call your attention to the fact that the basis of these rules is in disaccord with those adopted at the meetings at Ostende on the 14th of July, 1907, at the reunion of the delegates to the International Association of Recognized Automobile Clubs, at which the following formula was unanimously adopted:

"All cars taking part in the 1908 Race should have a 4-cylinder motor, with a bore of 155 mm. 6.1 inches maximum, or its equivalent in effective surface, whatever number of cylinders it may have.

Cars ready to start, but without water, without gasoline, without tools, and without extra tires, should weigh a minimum of 1100 kgs. (2425.06 lbs.).

In this weight of 1100 kgs. should be included the oil for the motor and the transmission."

Consequently French car builders have this year built their types of racing cars according to the rules above given, and the rules for the Grand Prix of the Automobile Club of France have been worked out on this same basis.

If the rules for the Vanderbilt Cup Race are as printed in the journals the car builders find themselves in the position of not being able to take part in this race, or to construct new types, which would be in opposition to the decision taken at Ostende.

I would be very much obliged, Mr. President, if you would be good enough to lay this before the Contest Committee of your Club, in order that the rules for the Vanderbilt Cup Race, which have not yet been definitely adopted, should be reconstructed so as to allow vehicles built according to the rules adopted at Ostende, to participate in this contest.

Will you please accept, Mr. President, the assurances of my most distinguished consideration.

President of the Commission Sportive,
(Signed) Chev. Rene de Knyff.

This letter was forwarded at once to Jefferson De Mont Thompson, chairman of the Racing Board of the A. A. A. and of the Vanderbilt Cup Commission by Robert Lee Morrell, of the A. C. A., with the request that the matter be presented at once. In this letter Mr. Morrell says:

"As the sole representative of all the national European Automobile Clubs and as the ony American member of the International Association of Recognized Automobile Clubs, the Automobile Club of America feels itself bound by the rules adopted at the Ostend Congress on the 14th of July, 1907, as set forth in said protest, and further that these rules are binding for any international race to be held in America."

At the time of going to press it is reported the A. A. A. will not change the Vanderbilt Cup rules and that the A. C. A. has proposed to the directors of the Savannah Club to conduct an international race there under the Ostend conditions.

The New York-Paris Race

According to latest reports, the competing cars in the New York-Paris race have departed from Vladivostock according to their finish in San Francisco. At a meeting recently held in Paris it was decided to send the Thomas Flyer away fifteen days ahead of the De Dion and the Zust, and thirty days ahead of the Protos car of Germany. The action of the committee having the race in charge is fair to the American car and this action has been approved generally throughout this country. George Schuster, who has been on the Thomas car ever since it left New York, will drive the car from Vladivostock to Paris and will not be replaced, according to rumors, by Monty Roberts or any other driver. George Miller will be his mechanician.

To be sold at auction for $1,650 was the fate of the Moto-bloc, driven by Goddard, who was telegraphed to abandon the race, sell the car and come home. The car was valued at $10,000. While the sale was proceeding an attorney engaged by an Iowa farmer made his appearance with a bill of $600 for hauling the car thru the mud half way across the State of San Francisco, foundering several mules on the job. After the bill was paid Goddard took the remaining $1050. Last but not least the U. S. Customs officials demand payment of $4,500 duty, which will probably be collected from the bondsmen in New York.

The Baltimore News Sealed Bonnet contest came to a successful close with seventeen contestants making perfect scores. It was originally intended by the Baltimore News when the contest was planned to give three cups to the first three cars in best condition after the contest, but with so many perfect scores the judges were in a quandary as to selection of the best three, so that after leaving the affair in the hands of the committee it was decided in favor of giving a small silver cup to each of the successful contestants. The contest was a success in every way. The large number of successful entrants who piloted their cars over the worst roads in the State, crossing mountains of the Blue Ridge, demonstrated the strength and durability of the automobile. Not only the big cars came through successfully, but the little Ford roadster, a 15-horse power car, surmounted all the difficulties of the way, and ended the run with a perfect score.

A. S. M. E. and S. A. E. to Meet

The Society of Automobile Engineers will hold their third annual summer meeting in connection with the semi-annual meeting of the American Society of Mechanical Engineers at Detroit, Mich., June 25-27. The meeting of the A. S. M. E. will open June 23d and close June 26th, the dates overlapping so that the members of both organizations may have the benefit of papers to be read at each.

Harrisburg Endurance Contest

Twenty-six cars were entered in the second annual endurance run of the Harrisburg Automobile Club over the route from Harrisburg to Philadelphia and back, a distance of 186 miles. All of the cars entered started except a Rambler entered by I. L. Brown. The Philadelphia control was at the White Garage, and the first competing car arrived there at 3.57 P. M., nearly an hour ahead of time. The cars came thru to Philadelphia in good shape, with the exception of two. A Stoddard-Dayton, driven by Howard Hodson, skidded and ran into a wall while turning a corner near Doylestown, throwing its occupants out, but without injuring anyone, and C. C. Cocklin lost twenty-five minutes thru a broken water connection. Another car is said to have broken a steering knuckle. The perfect score winners were as follows: Jackson (J. S. Trego); Pullman (E. G. Irvin); Pullman (J. S. Kline); Pullman (Stuart B. Lafean); Pierce Arrow (H. F. Rawle); Mitchell (W. M. Cram); Cadillac (S. Thorley); Ford (A. A. Jones); Rambler (A. H. Bitner); Pennsylvania (R. H. Croninger); White (Walter C. White).

At the regular monthly meeting of the Executive Committee of the A. A. A., New York, the Virginia State Automobile Association was elected to membership making the twenty-fourth affiliated State organization.

A resolution was adopted designating the second week in June next as the period during which the outings to the orphans by the A. A. A. clubs should be given and it is expected that a large majority of the automobile clubs thruout the country will conform to this action.

BUILT AND TESTED IN THE MOUNTAINS.

"R-S" Motorcycles

(AMERICA'S BEST)

THE first and only real Mechanical Intake Valve Motorcycle made and marketed in the United States. Thousands in successful use. The only Motorcycle to climb Pike's Peak. Full of practical features and improvements.

The "R-S" line comprises Single and Twin Cylinder machines, Tandems, Tricycles, Tri-Cars and Delivery Vans, and represents the most value as well as the most advanced motorcycle construction.

Hundreds of testimonials from every part of United States showing "R-S" achievements in racing, record making, hill climbing and endurance tests sent **FREE** with complete illustrated catalogue.

An American Motordrome Needed

The automobile racing season is now well opened and plans for numerous economy tests, road and track events have been arranged in all parts of the country.

This publication has consistently advocated all such events as would tend either by their character or owing to the rules governing them to increase the fund of information so zealously guarded by the designer, or to promote in other ways the welfare of the industry. Stock touring car contests unquestionably are of material help not only to the makers of the cars entered, but as a means of enlightening the general public as to comparative car performance. Even highly specialized racing machines when entered for long distance competitions have added their quota to the general fund of useful motor car information.

That there is an element of danger in all such competitive events not only to those actually engaged in operating the cars but to the spectators we fully appreciate, and for that reason advocate as far as possible the use of such courses as can be adequately guarded. Racing over unnecessarily tortuous or difficult routes is certainly not to be encouraged nor is it necessary, and events held on short circular flat tracks, the curves of which are not banked, are also dangerous. There seems to be but one remedy, namely, to provide a properly protected and safe place for such contests.

Automobile races of one form or another will probably be held as long as the public has use for such a vehicle. If this view is correct there is unquestionably a growing need in this country for a specially constructed motordrome such as Brooklands in England. A course of this kind provides a suitable place for holding not only high speed tests but for carrying out under favorable conditions mechanical and special efficiency investigations, which are now attempted under extremely adverse conditions and usually without authoritative supervision. The results of these nondescript performances very seldom supply dependable data. The lesson of Brooklands has shown that even as an advertising medium such a track can be made extremely useful to manufacturers who take advantage of the facilities and supervision offered. If centrally located the grounds might also be made the site of an immense exhibition hall in which each year could be held a truly representative show, as the enclosure would provide ample facilities for parking visitors' cars and the track a place for gymkhanas and competitive events. Such a course, if located at a large automobile manufacturing center in our country could be largely used by manufacturers and would relieve the public roads in these districts of much of the testing car nuisance. At the same time much valuable and reliable information would result.

Taking everything into consideration it would seem wise to have such a track built in this country, as undoubtedly the American industry is now, and will continue to be sufficiently in need of a protected course of this kind, to make its construction advisable and its use profitable.

Demand for Convertible Bodies

As the mechanism of the automobile draws nearer and nearer to perfection and standardization of its parts progresses, the variation in the construction of the bodies becomes more evident. For some time past there has been evinced a growing tendency of the public for convertible bodies. This demand is being met by several of the best known makers by supplying two or even three bodies with a single chassis, the whole at a comparatively reasonable figure, and it is evident that this enlarging of the field of usefulness of the individual chassis is a feature which will play an important part in motor car sales in the next few years.

Cars are not as apt to be turned in at the end of each season as formerly and pur-

Hosted by Google

chasers expect several years' uninterrupted service from their machines. The convertible body really supplies several cars in one and makes it possible and profitable to use a single car several years. The extremely heavy car is gradually giving way to lighter forms which are less expensive to maintain. This is shown in the demand for cars of runabout type, yet capable of carrying at least four, or even five passengers. The result has been the development of what is known as the tourabout, or a car having two individual removable seats at the rear or an open surrey seat capable of carrying three persons. Compare this modern vehicle with the previous heavy touring car capable of seating the same number of persons. It is lighter and much more graceful in appearance. Furthermore, in many instances the rear seat arrangements are of a convertible nature and can be folded up, making a sightly runabout for two, or the seats can be arranged to carry two or three persons at the rear or can be even completely removed, providing a rear deck for baggage. In other cases the entire body above the frame and to the rear of the dash can be removed and replaced by an enclosed body or bodies of landaulette type for winter use, but these changes very often necessitate considerable expenditure of time and strength and are not yet as thoroly perfected as could be desired.

We believe that a type of body would meet largely with public approval, in which the upper portion only need be converted instead of its being necessary to change the complete body. Such a convertible type could be arranged so that it would form a unit, which could be easily suspended in the garage and almost instantly lowered into position somewhat after the manner of the suspended harness for fire engine horses, thus materially reducing the labor of converting the car.

The convertible body certainly offers a ready solution of the problem which confronts the average purchaser. If a car is desired for business purposes, a seating capacity of two is ample, yet the purchaser also desires occasionally to take his family or friends for a drive, but he does not care to lug this extra seating capacity arrangement around in his business drives. Again, he may wish to make a tour, and, under these circumstances, it is extremely difficult to choose a car which can successfully supply these various needs. The convertible body, however, does fill these needs and makes it possible to rapidly change a single car into two or three different types, and all this can be done without having an excessively heavy chassis. Body building has reached such a state of perfection that substantial constructions are now made which are comparatively light, and these are nearly always so arranged that windows can be lowered, fronts lifted, etc., giving additional comfort to the occupant.

That the convertible body is now and will continue to be a live factor in connection with the sale of cars we are firmly convinced and therefore suggest improvement along the lines of lighter convertible types, particularly the design of such bodies that only the upper portion need be changed rather than the complete body.

Somewhat of a Nuisance

We have several times mentioned in these columns the need for two-speed and free engine devices on up-to-date motor cycles of American manufacture. The advantages of a machine fitted in this way are very numerous and can be appreciated by all riders. Many of these features have been pointed out, but recently we have had our attention called to still another matter connected with motor cycle use which would be greatly improved were free engine devices more generally used. We refer particularly to the disagreeable muffler explosions which are so apt to take place whenever the rider slows down by cutting off the spark. These explosions riders are accustomed to and they do not mind them, but how about the skittish horse or the unsophisticated pedestrian? The unfortunate part of this matter is the fact that nearly always these explosions occur just at the most inopportune time. For example, the motorcyclist, in threading his way thru traffic, notices a restive horse and naturally slows down somewhat as he approaches, very often cutting off his engine altogether just as he gets under the horse's head, and, of course, at this instant two or three terrific muffler explosions take place, and in some cases runaways have been caused in this manner. In one instance, the Court even censured the rider, which was manifestly unjust as he had done everything in his power to conform to traffic regulations, the entire fault lying with the mechanical arrangements of the machine.

Aside from the actual damage which may be caused by such unexpected explosions in the muffler there is also another phase of the question to be considered, that is, the effect upon the feelings of pedestrians in regard to motor cycles in general when machines make these disagreeable and startling reports. It is not uncommon to hear a person say after such an occurrence, "Well, I wouldn't ride one of those gattling guns if I had to walk the rest of my life," or some such equally uncomplimentary remark all of which goes to show the effect that such crudities, for they are crudities, have upon the portion of our community who are not users.

Running with the muffler open is another matter which can be classed as regards its

Hosted by Google

effect in the same category, but is, of course, within the control of the operator, while the muffler explosion is not completely so.

If for no other reasons than those mentioned in the foregoing, it would be worth while for makers to supply some form of free engine device by means of which it would be possible to slow down without the engine continuing to run, ejecting charges of unburned gas into the heated muffler. The more refinements which can be incorporated in the design of these machines the more rapidly they will be taken up and used by the public. The same sequence of events can be traced in the history of the automobile, for in the early days nearly every auto sounded more or less like a threshing machine, particularly when on the intermediate or low gear, and this fact created considerable prejudice against them. However, as the cars were perfected and more efficient mufflers supplied, these defects gradually disappeared and to-day it is very unusual to hear a machine making such an uproar as was the common occurrence but a few years past.

We do not mean to say that the motor cycle is at present in such a bad state but there are still a number of improvements which can be made and none will insure their taking up and sanctioning by the public any more speedily than those which produce absolutely quiet running.

Plenty of Events for 1908

There is a seeming unanimity of opinion in regard to the advantages to be gained from competing in open events and all of the great contests, touring, hill climbing and racing, of 1908, will probably have record breaking entry lists. The season's prospects are therefore of the very best and the hill climbing events, the economy and endurance runs and track races of May with the events of similar nature in June and the A. A. A. tour of July will be well entered. The entry list for the A. A. A. tour is already open and entries are being received. The month of August will see a number of twenty-four hour races and some time in the Fall the first race for the J. De Mont Thomson trophy for stripped stock cars will be run. Then will come the elimination trials for the Vanderbilt Cup Race and then the Vanderbilt itself with hill climbs and touring contest until snow flies. Nor are these contests going to be easy going affairs when of the touring nature, for the promoters plan to bring forth winners this year by an increase in the stringency of the rules as was the case last Fall.

Suicide of R. Hale Smith

R. Hale Smith, president and treasurer of the R. H. Smith Manufacturing Company, Springfield, Mass., well known maker of the Springfield Motometer, shot himself while sitting at his office desk. Brooding over the fact that his speed indicating device had not been the financial success anticipated, is given as the reason for his action.

Before taking his life, he called up his brother and a doctor and requested them to come to the office as soon as possible. He also called up an intimate lady friend of his wife and told her to hasten to his home as she was needed. He then sent a messenger boy to his house with a note to his wife, saying that he contemplated suicide and another to her friend asking her to look after and console his wife. He lived but 55 minutes after the ball entered his temple.

Mr. R. H. Smith was one of the best known men of Springfield having been a member of the common council and board of public works on which his knowledge of engineering made him of much practical value to the city.

He leaves a son, Henry Pratt Smith, a successful business man of Guanajuato, Mex., a brother, Henry M., of Springfield, vice-president of the R. H. Smith Manufacturing Company, and two sisters, Mrs. Emily McCall of Lebanon, Conn., and Miss Ellen M. Smith of Springfield.

A New Route Between New York and Philadelphia

As many tourists have declared their intention of keeping out of New Jersey because of the drastic and unreasonable provisions of the new automobile law which goes into effect on June 1, the announcement of R. H. Johnston, Chairman of the Good Roads Committee of the New York State Automobile Association, that he has found a very desirable touring route between New York and Philadelphia which does not enter New Jersey, will be hailed with interest. The new route skirts the northern boundary line of New Jersey and then, crossing from Port Jervis, New York into Matamoras, Pa., follows almost a straight line down the Delaware valley to Philadelphia. The distance is about 225 miles only about 30 of which are not first class—and the scenery is said to be excellent.

In connection with the Subway celebrations at Jamaica, L. I. automobile time trials will be held on June 5, on Hillside Ave. They will be run in classes with an interesting free-for-all to top off the day's events. Three miles of splendid roadway will be fenced off and adequately guarded by the police. Hillside Avenue will be rolled and specially prepared for the events and there will be a thorough oiling of the course.

Two-Cycle Engine Considerations

By E. S. FOLJAMBE

LACK OF FUEL ECONOMY.

With the recent revival of the 2-cycle engine and its growing use for automobile propulsion, the question of fuel losses or lack of economy in this type of motor is again brought up for careful consideration. That the small 2-cycle motor as ordinarily designed, or, more accurately speaking, as ordinarily built, for many specimens of this type seem never to have been designed, is wasteful of fuel is conceded. It will be understood that this discussion has no reference to the large and complicated stationary 2-cycle engines, the efficient performance of many of which is all that can be desired.

Much of the general impression in regard to the low fuel efficiency of small motors is doubtless due to the action of illy designed and crudely built marine engines of early type. Nevertheless, it may here be said that these same crude constructions were and even now are used, because they run and continue to run, with practically no care or attention, and this characteristic is a well-known asset of the simple 2-cycle engine. More modern 2-stroke motors are now being designed which approach much more closely the economy of the 4-cycle engine, and startling statements are occasionally heard from inventors that their engine is just as efficient as the 4-cycle, yet the writer has never had the pleasure of seeing any of these marvels under test.

There are many inherent reasons why the 2-cycle engine is somewhat wasteful of fuel, but much has been and can yet be done by careful designing to improve and possibly correct this principal defect without losing the simplicity of the type. In attempting to attain the goal of maximum fuel economy and consequent power production, many designers have been led unwittingly into the construction of motors fully as complicated and almost as heavy as the 4-cycle models, which naturally defeats the very end desired.

Losses are due to such causes as incomplete scavenging and consequent fouling of the working charge, direct losses to the exhaust, back firing, crank case losses. incorrect mixture, four cycling, etc., all these conditions being more or less intimately associated with 2-cycle action.

THE TIME ELEMENT.

Completely expelling the burned gases has been and is yet the greatest obstacle to be overcome. Time enters largely into this problem, for it must be remembered that actions which can be made to take place at moderate speeds cannot be carried out successfully at higher speeds. The almost infinitesimal port opening duration of the 2-cycle engine can be appreciated when it is stated that the entire sequence of exhaust, scavenging and intake in an engine of ordinary construction running at 1000 R. P. M. does not exceed 2-100 of a second and yet engines have been known to turn up light, between two and three thousand revolutions per minute. Experiments have shown that in the De Dion type 4-cycle engine it is impossible to get a charge of more than 60 per cent. of the actual piston displacement into the cylinder when the speed exceeds 1500 R. P. M. This same difficulty exists with the 2-cycle, only to a greater extent. The maximum working speed or that at which the engine will continuously carry a load is therefore much less than it can attain when running light. This working speed, of course, is determined by the balancing of two opposing factors, namely, decreased power at high speeds, due to insufficient charge, and increased power due to the larger number of impulses in a unit of time.

SCAVENGING.

Extreme and opposing views in regard to the scavenging of the combustion chamber are apparently held by designers. On one hand it is claimed that the residual gases must be forcibly driven out and on the other that as the exhaust port is uncovered while the gases are still under pressure, they rush out of their own accord without external assistance. Both of these assumptions are doubtless partially true, but the best action is obtained in a design based on a combination of these assumptions. If the stroke is too short or the exhaust port too high in the direction of the cylinder length, and the gases are liberated at considerable pressure, they will doubtless rush out of the exhaust, and at high motor speeds it is conceivable that due to inertia effects the resulting pressure in the cylinder might even be reduced to less than atmospheric. However, unless the new charge is forced into the cylinder or the exhaust otherwise assisted, high motor speeds cannot be obtained, and manograph records almost invariably show that when working under load the pressure in the cylinder never falls as low as the atmospheric line. Furthermore, exhausting at too great pressure is also wasteful of fuel. On the other hand, when the exhaust action is assisted by an inrush of either mixture or air, altho the scavenging is accomplished more rapidly, it will be seen from the foregoing that the action is not due entirely to the driving out of the old charge by the new, as sometimes stated.

Hosted by Google

The greater the pressure of the new charge at the time of its expansion into the combustion space the more rapid will its transfer be, and, of course, this rapidity bears a direct functional relation to the amount which will enter the cylinder during the very limited time the intake port is open, and therefore to the resultant greatest speed and power obtainable from the motor. Again, however, opposing forces are at work limiting the advantages to be derived from highly compressing the charge before its transfer, for it must be understood that all the work done on the charge before it enters the cylinder, is negative. Furthermore, compressing it also heats the entering charge, which is not advantageous when carried beyond the temperature necessary to insure sufficient vaporization of the fuel to form a good mixture, and when a good mixture has been obtained the cooler it is when entering the cylinder the larger the quantity of fuel that can be made to enter and the great will be its useful rise in temperature when fired. The larger the volume of charge transferred, other features being similar, the more complete will be the scavenging, and it is even possible, by means of differential pistons and auxiliary pumps to more than fill the entire space swept by the piston and that represented by the clearance, in which case there is, of course, a direct loss to the exhaust port. But even under these conditions there is no certainty that all the exhaust has been expelled and the actual proportions of the mixture depend almost entirely upon the location, form and area of the port openings, the shape and size of the deflector or baffle plate and the form of the cylinder head.

THE PORTS.

Both the intake and exhaust ports of the ordinary 2-cycle type motor in which the piston acts as a valve should be made as large as possible in a circumferential direction rather than in height. This gives a larger port area close to the end of the stroke, where the motion of the piston is slowest, therefore this port area is open during a longer period than when the same area is obtained by making the ports taller. In no case, if 4-cycle engine performance is to be approximated, should the exhaust open earlier than it does in 4-cycle engines, the limit being about 45 deg. on the crank circle before the crank end dead point is reached. Opening earlier simply cuts down the actual length of the working stroke, wastes fuel and is not necessary if sufficient port area is gained circumferentially. In this direction the ports can be extended almost to touching, leaving simply sufficient wall space between to carry the piston ring openings, three fourths of an inch being about the minimum that can be allowed. There is one objection to this arrangement. In engines with high compression in which the available space above the piston is small, say less than 20 per cent of the total cylinder volume, and in which the cylinder head is considerably curved, the baffle plate must necessarily be rounded at each end, and if not very tall this may almost cut away the baffle plate at the cylinder walls as shown in the sketch at A, Fig. 1. Under these conditions, when the intake port is fully open a small amount of charge might pass over to the exhaust port. However, as 2-cycle motors do not ordinarily have high compressions and small clearance, the baffle plates are usually high enough to prevent this action. The end of the baffle plate should, of course, be as close a fit to the cylinder walls as possible, but this is a matter which will be considered in connection with different forms of baffle plates.

THE BRIDGES

The axial height of the intake is usually from half to two thirds that of the exhaust in order that the cylinder may be relieved of a considerable part of the waste products of combustion before the entry of the new charge and is made about 1-6 to ⅛ the stroke, depending on its circumferential dimension and the width of the bridges, two of which are ordinarily placed to prevent the rings catching in the ports. These bridges should be as narrow as possible in order not to interfere with the incoming gas, ¼ inch being about as narrow as practicable. They should be placed diagonally, that is, not parallel to the cylinder axis, as shown in Fig. 1 at B, in order to bear on a larger part of the circumference of the piston rings and thus

Hosted by Google

prevent the wearing of a groove in the rings which, being pinned, always bear at the same place on the bridges. This arrangement of bridges also permits the entering charge to successively sweep every part of the cylinder.

On the down stroke this height arrangement of the ports can be made to give exactly the relative time of exhaust and intake port opening, but on the up stroke it gives just what is not desired. In other words, the intake is closed first while the exhaust still remains open allowing a loss. The best action would be had if these conditions were just reversed, allowing the intake to remain open slightly after the closing of the exhaust. Some designs obviate this difficulty by providing an intake valve, usually automatic, or by the use of an auxiliary sliding sleeve in the cylinder in which in turn the piston slides, the differential motion between the piston and sleeve being arranged to close the ports as desired, but these forms are apt to introduce complications.

It might appear that as the intake is open during the first part of the up stroke of the piston some of the charge might be forced back, but this does not take place, as the motion of the piston is so slow at this portion of the stroke and the gas is rushing in under pressure. Furthermore, the inertia of the gas would tend to keep up the flow into the cylinder and out of the exhaust, even if the pressure in the crank case or other charge compress chamber was down to atmospheric, and this can be taken advantage of as will be pointed out later. But during all this time the exhaust is still open and a continuous flow of either burned charge, fresh air, or, more likely, a mixture of both, has been passing out, thus wasting fuel. It is contended by some that it is impossible for any fuel to thus pass out, as it is assumed that the maximum amount entering the cylinder is only equal to the piston displacement and this volume would only be sufficient to fill the clearance space and the upper part of the cylinder down to the top of the exhaust port.

This view of the matter is evidently hypothetical, as it is certain the entire cylinder from the head to the top of the piston is filled with something and it is inconceivable that any clearly defined horizontal plane of demarkation should exist across the cylinder at the height of the exhaust port, with entirely fresh gas above and burned gas below. The fresh charge certainly mixes to a greater or less extent with the residual gas and largely reduces the resultant power of the explosion. Yet it must be borne in mind that even in the best 4-cycle motors the clearance space contains waste products of combustion which mix with the fresh charge. This being true, a 2-cycle engine in which there is a minimum amount of old gas diluting the new charge and in which sufficient charge can be introduced, to completely fill the cylinder, including the clearance space without complicated and power consuming mechanism, this engine should develop more than double the power of a four-cycle engine of equal dimensions at the same number of revolutions and is the ideal internal combustion engine for which designers are striving.

(To be continued).

Creditable Performances

A Woods electric car was recently driven up a steep hill on 21st Street, Kansas City, Missouri, said to have a grade of 22 per cent., the hill at the time being covered with a hard glaze of ice. This climb was made as a demonstration and three blocks including the hill were covered in 1 minute 10⅔ seconds.

H. E. Frederickson drove a Thomas Flyer from Cheyenne, Wyo. to Omaha, Neb., at an average speed of 17 miles per hour, breaking the record, it is said, for the run between these two cities. He left Cheyenne at 7 A. M. March 10 and arrived in Omaha Tuesday afternoon, having ridden night and day without stopping except for food and supplies. He slept four hours curled up on the rear seat while his mechanic drove, but drove the car all the rest of the time himself. Between Cheyenne and Sidney (Neb.) he averaged 30 miles per hour but after leaving Sidney struck softer roads.

A Reo 2-cylinder car recently made a new non-stop record of 4,992 miles, this distance having been covered in twelve days continuous running from 6 A. M., April 4, to 8.35 A. M. April 16, with representatives of the Los Angeles (Cal.) Times as observers. The average speed was 415 miles per day and the best day's running was 503 miles covered the first day. Only 4½ gallons of water were used in the cooling system and altho a full load of passengers was carried, the car averaged 17 miles on each gallon of gasoline.

Using a demonstrating car from stock, Mr. H. B. Odell, one of the salesmen of the Buffalo Mora Car Agency, had the power plant securely sealed by Dia. H. Lewis, Secretary of the Buffalo Automobile Club, and arranged for representatives of the press and club members to act as continuous observers in a 1,000-mile reliability test of a 6-cylinder Mora Racytype. The test was made on the streets of Buffalo and on roads 30 to 35 miles outside the city where actual road conditions were encountered at all times. The run was completed in 47½ hours actual running time, or an average of better than 21 miles an hour, allowance being made for tire repairs.

FRANKLIN

Before you buy any automobile see it weighed and test its strength.

Look at the running-cost of a light-weight automobile compared with a heavy one.

You can carry seven passengers in the Franklin Type H automobile cheaper than you can run the ordinary 5-passenger machine. And Type H has six cylinders with all the smoothness and speed and perfect balance they give. Think of it!—a powerful roomy touring-car refined and strong and capable of 55 miles an hour; yet weighing only 2600 pounds, and actually costing less to own and run than the average 5-passenger 4-cylinder machine.

Other seven-passenger machines both 4 and 6 cylinders, weigh on the average, a thousand pounds more than type H, and cost over 40 per cent more to run besides depreciating faster.

All the Franklin models are on the same principle—high power with strength and light weight.

The Franklin doesn't bump itself to pieces nor jolt its passengers. The laminated wood-frame and four full-elliptic springs absorb road-shocks. There are no water-cooling troubles. What water-cooled motor could run a solid week with the automobile standing still in a warm salesroom, as the air-cooled Franklin did at Chicago? What heavy automobile could run from Chicago to New York in less than 40 hours?

You can't drive a heavy, steel-frame, hard-riding automobile at speed safely and comfortably on American roads.

You're sure of comfort and safety in a light-weight Franklin.

Fires, Failures, Judgments, etc.

A petition in involuntary bankruptcy has been filed against the American Gasoline Motor Company of Baldwinsville, N. Y.; liabilities $12,000, and assets $8,000.

The Detroit Trust Co., trustee in bankruptcy for the Aerocar Car Co., Detroit, Mich., is sending out checks to creditors to the amount of $22,000. This is the second dividend, which is 10 per cent. making with the first dividend a total of 22½ per cent.

The Brockton Motor Exchange, Brockton, Mass., has been bought by a new concern named the Gay Automobile Co. The new company has been incorporated with a capital of $10,000, and will continue the general automobile business at the same location, 351 Belmont avenue.

Fire in the basement of the Central Auto Garage, 67 Fountain street, Providence, R I., did very little damage, it being promptly discovered by Frank Reid who immediately turned in the alarm.

Schedules in bankruptcy of the Darracq Motor Car Company, No. 1,989 Broadway, show liabilities $61,219 and nominal assets $85,232, consisting of 12 automobiles, $44,867, covered by a bill of sale to the New Amsterdam National Bank as security for a debt of $11,500; one other automobile not in the bill of sale, parts and accessories, $16,-571; furniture and fixtures, $1,226; machinery, $1,421; accounts and notes, $20,762; cash $35; fire insurance $350.

The creditors of the Empire State Engineering Company, 149 Broadway, New York City, have filed a petition in bankruptcy against the concern.

James T. Graff, a garage owner of Spring Lake, N. J. has filed a petition in bankruptcy with assets of $315 and liabilities of $93,699.52.

The Kolb & Berger Mfg. Co., of 530 East Seventy-second street, New York City, filed petition in bankruptcy; liabilities $7,764 and nominal assets $4,825.

Eight separate suits to recover an aggregate amount of damages of $35,000 and to enjoin what is declared to be a wholesale fraud in the sale of automobile oils were filed by attorney Joseph R. Wilson, retained by Chas. F. Kellom, a pioneer manufacturer of lubricants in Philadelphia, Pa., against all garages and automobile supply people, who are and have been for several months, selling an alleged spurious concoction for the plaintiff's product, "Invader" oil.

The Manhattan Storage Battery Company of New York City, was fined $100, on May 13th for violating the injunction issued against it restraining it from selling imitations of the Rushmore lights.

A petition in bankruptcy has been filed against the Martini Import Company, dealer in automobiles, 239 West Fiftieth Street, by Epstein Brothers for these creditors: Frank Presbrey Company, $505 for advertising; Ernest Edwards, $371, advertising, and Pneu. L'Electric Company $226, merchandise.

In the case of F. S. Dickinson against the Matheson Motor Co. of Kingston, Judge R. W. Archbald recently decided for the defendant notwithstanding the verdict given the plaintiff for the amount of his claim $16,000, with $3000 interest, in the last session of the United States court in Scranton, Pa.

Schedules in bankruptcy of the Mercedes Import Company, wholesale dealers in automobiles, formerly 590 Fifth avenue, New York City, which was backed by Charles W. Morse, show liabilities $228,755 and nominal assets $261,514.

The National Cement and Rubber Co., of Toledo, Ohio, well known manufacturer of bicycle cement and rubber specialties, is in the receiver's hands.

Albert L. Perkins, a dealer at 1437 North Second street, St. Louis, has filed a petition in bankruptcy; liabilities are $29,525.73 and assets, $14,057.

The Prest-O-Lite Co., of Indianapolis, has filed a complaint against the Post & Lester Co., of Hartford, alleging infringement of its trade mark.

A dividend of 25 per cent. is soon to be paid creditors of the Pope Mfg. Co as soon as the court in New Jersey approves of the order to pay the dividend. Authority has also been granted by federal judge Robert W. Taylor to reduce the equipment of the company.

The schedules in bankruptcy in the case of Leon Rubay, 1697 Broadway, N. Y., show liabilities of $25,186 and assets of $19,562.

The Stepheny Spare Motor Wheel, Ltd and the Spare Motor Wheel of America, is bringing suit against the Black Mfg. Co., of Ft. Wayne, Ind., alleging infringement of patents and asking an injunction.

The Elkhart County Trust Company of Gohen, was recently named as trustee for the bankrupt Shoemaker Automobile Company of Elkhart, Ind.

Eugene Turton has been appointed receiver for the Star Motor Car Company, of 226 Halsey street, Newark, N. J. The liabilities of the company are estimated at $14,000 and the assets $3300.

The Winchester Speedometer Co., of New York City, was recently sold out at public auction.

In direct contradiction to all reports, Strang is still in the employ of Mr. John H. Tyson and is simply on a leave of absence while with the Thomas car at the Grand Prix.

Trade Changes

Mr. C. F. Green, formerly with the Automobile Equipment Company, has severed his connections with that concern, and purchased its top factory, and has combined his interests with the Motor Specialty Company, 239 Jefferson Ave., E Detroit, Mich.

The Auto Tire Company, agents for Morgan & Wright tires in Kansas City, have removed to 605-607 Fifteenth St.

Auto Supply and Storage Co. of Baltimore, Md. which had agencies for a number of popular cars, has changed its name to the Auto Accessories and Storage Mfg. Co. and has given up the car agencies and will devote its time to manufacturing specialties.

The Auto Parts Company of Chicago, Ill., dealer in engine parts has moved from 27 South Clinton Street to larger quarters at 99 West Monroe Street.

The R. F. Boda Co's. garage, located on East Rich street, Columbus, Ohio, will soon be removed to West Main street.

The Cleveland Cap Screw Company of Cleveland, Ohio, has changed its name to the Electric Welding Products Company

The Chicago Branch of the E. R. Thomas Detroit Company has been removed from the salesroom of C. A. Coey & Co. on Michigan Avenue to the salesroom of Levy & Fanning, 390-392 Wabash Avenue. Mr. Geo. W. Hipple will continue as manager.

The Commercial Motor Car Co. has moved its offices from Room 708 Times Building, New York City to Room 403.

The Empire Tire Repair Company of Chicago, has moved from 1301 Michigan avenue to 1615 Michigan avenue.

The Electric Garage Company, of Utica, New York, recently moved from 7 Court street to the building on Cornelia street known as "Dr. Watson's stables."

The Holmes-Booth Co's. establishment on Euclid avenue, Cleveland, has been bought out by M. E. and H. A. Steere, who were formerly employed by the Cleveland Elmore branch. They will conduct a garage and repair place.

The Hamilton Garage, of Allentown, Pa., will in the future be known as the New York Garage, with Mr. J. Harold Thomas as manager.

The Isotta Import Company, will move from its present quarters at 12 West Thirty-third street, New York City, and be established in the Palmer & Singer building, 1620 Broadway.

Will Johnson, of the Johnson Auto Company, of Boone, Iowa, has disposed of his interests in the business to G. D Johnson, the senior member.

Chas. Jobson's garage at Macon, Mo., was recently bought by Bert Allen and John Thomas, who will sell in addition to automobile extras a supply of electrical fixtures.

Marshfield Auto Garage, of Marshfield, Wisconsin, has been moved from the Adler Block to the Baumann Building.

The Milwaukee Automobile Livery Company, of Madison, Wisconsin, filed an amendment to its charter, changing its name to the Bland-Mueller Auto Co.

F. R. Parker, Boston agent for the Elmore, has moved into new quarters at 243 Columbus avenue.

S. S. Pierce, a young business man from Boston, has succeeded the Western Automobile and Supply Company, at Colorado Springs, Colorado.

A. J. Ray, one of the members of the firm of the Ray-Wortham Auto Garage Co., succeeded by the Hamilton Clough Auto Co. recently, will remain with the new concern and will have charge of the same branches of work formerly under his supervision.

The Swinehart Clincher Tire and Rubber Co's. New York office is being moved to 875 7th avenue, where a three story building has been leased and the Chicago branch will remove about July 1st to a new three story building at 1720 Michigan avenue.

The Triumph Gear Company, of Detroit, Michigan, moved from Sixth and Congress streets to Seventh and Abbott streets.

The Fraser Blowout Patch Company has moved to its new quarters in the Thoroughfare building, 1779 Broadway, New York City.

Tincher Motor Car Co., of South Bend, Ind., has removed its Chicago branch from the Chicago Automobile Club building to 1220 Michigan avenue.

Geo. H. Terry & Co., 92 Chambers Street, New York City has been succeeded by the Terry Engine Co., Bryant Park Bldg., 42nd and 6th avenue, New York City.

Chas. S. Taylor, Great Barrington, Mass., sold his garage to James Crotty and John P. Viola, owners of the building in which the garage is located. Ellis Holbrook will manage the business.

E. D. Verstraete, manufacturer of automobile parts, etc., has removed from 421 Clinton street, Milwaukee, to Burlington, Wis., where larger quarters have been secured.

The Weldon and Bauer Company, successors to the F. E. Boland Co., agents for the National and Correja cars, recently moved from 239 Halsey street to the new building at 200-202 Halsey street.

The Zacharias Garage Co., of Asbury Park, N. J., was recently incorporated by Chas. R. Zacharias, Leonard Hutis, and Frank C. Martin with $100,000 capital.

Hosted by Google

Legislative and Legal

OHIO MOTOR VEHICLE BILL.

The motor vehicle bill which has interested automobilists of Ohio for some time was recently passed by the state legislature and will become a law thirty days after its signing by the governor. Speed traps are done away with but very fast driving is considered prima facie evidence of recklessness. All cars must be registered with the secretary of state in Columbus who in turn notifies every county clerk in the state.

The registration fee for gasoline and steam automobiles is $5 under the new law, while electric vehicles will be obliged to pay but $3. Commercial vehicles are not included in this bill and there will be no charge for them, they being classed as business and not pleasure vehicles. Dealers will be required to deposit $10 for each make of car handled and pay a fee of $2 for each license.

AUTO TAX MEASURE DEFECTIVE.

Senator Armstrong's automobile tax measure in New York has been found defective. Altho machines weighing 2500 pounds would be taxed $10 and those weighing 3000 pounds $15, machines of 2600, 2700 or 2800 pounds would not have to pay any tax at all. It may be remedied at the extra session.

Legal Notes

Charles F. Kellom, lubricant maker of Philadelphia and well known as the originator of 'Invader" oils, on April 30 brought suit against eight different concerns for fraudulent sale of oils under his trade name "Invader."

The New Jersey Automobile Trade Association and other New Jersey organizations are raising a fund to test the constitutionality of the new amendment to the New Jersey automobile law, under which high license fees are to be exacted for road improvement purposes.

Magistrate Butts, of New York, in the Yorkville Court recently decided that physicians may speed their cars in city streets in driving to emergency cases.

Probably the most important legislation recently enacted in New York in connection with roads is the joint highway commission bill, which virtually takes the control of the state highways from the State Engineer and vests it in a commission.

For the purpose of determining whether or not a speeding motor car could be stopped in time to avert an accident if certain large coal bins did not hide an approaching train from view, Coroner Southeimer of Atlantic City, N. J., recently made official tests at a railway crossing at May's Landing, where Samuel Bailey of Camden had been killed, and found that a car going at the rate of 25 miles per hour could be brought to a stand 12 feet from the crossing if the brakes were applied 60 feet from the same. The matter is of general interest as an authentic and unprejudiced test of stopping abilities of motor cars and as proof that such a speed is not necessarily dangerous.

Suit has been brought against the New York Taxicab Co. and the New York Motor Cab Co. by the Association of Licensed Automobile Manufacturers for the alleged infringement of the Selden patent.

Prince Henry Cup Race

The Prince Henry Cup Race will be run in six stages as follows: First, June 9, Berlin to Stettin; 2nd, June 10, Stettin to Kiel. On June 11 there will be a rest at Kiel. 3rd, June 12, Kiel to Hamburg. Speed contest on a level between Rendsburg and Itzchoe. June 13, rest at Hamburg and exhibition of the competing cars. 4th, June 14, Hamburg to Hanover. 5th, June 15, from Hanover to Cologne; 6th, June 16th, Cologne to Treves; 7th, June 17, Treves to Frankfort-on-the-Main. Mountain speed contest between Bacharach and Rheinboellen.

Trade and News Items

E. J. Bartlett, who was formerly connected with the engineering staff of the Electric Vehicle Company, has recently accepted the position of chief engineer of the Long Arm System Co., Cleveland, Ohio.

The Dayton Electrical Mfg. Co., of Dayton, Ohio, has elected Major R. L. Hubler as secretary and general manager of the company. W. D. Brown will continue to act as sales manager and R. F. Sutliffe as purchasing agent.

The Webster extension gauge described on page 168 of our May issue is made by Webster Mfg. Co., 251 Causeway street, Boston, Mass., and 149 Jefferson Ave., Detroit, Mich. There are a number of concerns with the same name and by mistake we gave the address of another Webster Mfg. Co. in our description of this new gauge.

The recent 123-mile endurance run made by the Norristown (Pa.) Automobile Club to Lancaster and Reading and return resulted in the finishing with perfect scores of sixteen cars. A rather novel disposition of the silver cup was made by the club. At a subsequent meeting of the sixteen winners it was decided not to run over again and instead of disposing of the silver cup by lot as was previously announced by the club, it was decided to melt it and make it into medals. These are to be given to the owners and drivers who made perfect scores.

Thirteen cars finished with perfect scores in the Detroit Automobile Dealers' Reliability Contest, which incidentally has stirred up more automobile interest than any event ever known in the State. The lucky thirteen cars and drivers are as follows: Franklin (Davis); Thomas (Grant); Peerless (Bemb); Northern (E. J. Chapin); Maxwell (Kelsey); Thomas (Mochesky); White (Sheridan); Northern (House); Pierce-Arrow (Day); Oldsmobile (Aubel); Stoddard-Dayton (Lane); Thomas (Lorimer), and Oldsmobile (F. E. Crum). The success of this contest will no doubt result in an annual repetition of the event, and even now there is talk of a non-stop run over the same course this summer.

The Auto-Meter Is Believed

Talk about speed indicators that are believed—that have figured largely in famous events! Here are a few right off the reel—just jotted down from memory! The reviewing of big motor events is nothing more or less than a history of the successful career of the Auto-Meter.

Glidden Tour, 1906, 38 Warners used; All other makes, 23.

Memorial Day Races, Denver, 1906. Thomas "40" won 1st; Stevens-Duryea 2nd; both Warner-equipped.

Mudlark, 1906, from New York to Daytona, Warner-equipped; big tour afterward.

Memorial Day, 1906, non-stop run, New York-Boston-Springfield; Knox Waterless made record, Warner-equipped.

Franklin car, San Francisco-New York, 4,500 mile run, August, 1906; Warner-equipped.

Percy Megargle with Reo Mountaineer, across continent and back, 12,000 miles, 1906, Warner-equipped.

Military Message Run, Chicago-New York, June, 1906, Buick car, Warner Auto-Meter.

Military Run, New York-San Francisco, Aug., 1906, a Warner was used.

Red Cloud, Olds, trans-continental run, 1907, Warner-equipped.

Glidden Tour, 1907, 75 cars started, 53 used Warners; 21 used all other makes.

Detroit Reliability Run, 1907, winner used Warner.

New York-Chicago Sealed Bonnet Contest, winner Warner-equipped.

Long Island Economy Run, Frayer-Miller, winner, was Warner-equipped.

In New York-Paris Race only speed indicator in the run is a Warner Auto-Meter.

Ralph Owen, driver of Mudlark, 1908, bought a Warner for this car though offered another as a gift.

Winning Haynes car in Chicago Reliability Race, December, 1908, was Warner-equipped.

Charles J. Glidden has piled up 42,367 miles in 35 countries with a Warner Auto-Meter.

The fire departments of the following cities use the Auto-Meter: New York, Boston, Detroit, Chicago, Denver, Joplin, Mo., and Seattle, Wash.

All the reliable maps of the country have been laid out with Auto-Meters: The Blue Book, White's Route Books, all Canadian maps, Michael's Pictorial maps, all Glidden Tour courses, King's maps, Briarcliff Course, etc.

Nearly all the automobile makers of the country use the Auto-Meter to test their cars before leaving the factory.

The E. R. Thomas Motor Co. and the Olds Motor Car Co., furnish the Warner as part of the regular equipment.

tween the cylinder heads, where it ge
some of the heat therefrom, but if desir
it can be placed much higher for use
the South, where deep fords are frequent

Digitized by Google

aving grooves on its outer circumference hile the larger is grooved interiorly.

In front of the ear axle hangs the otor with a long ank shaft, each end which telescopes to ermit either of two three grooved roll-s on the ends to be rought into line with e grooved rings by anipulating of the hange pedal. When ese rollers are in e desired alignment e whole power plant swung bodily for-ard or back to en-age them with the rooved rings and the ehicle is propelled by e friction of the rooved rollers in the rooved rings. It is vident that these rooves may wedge ghtly together with-ut undue pressure on e speed lever and so ive perfectly with-ut great strain on e bearings. The rol-r shafts are provid-d with roller bearings their outer ends nd so are able to ke any roller strain ithout undue fric-on.

The rings are so laced that the high peed forward and low peed reverse are in ignment at the same me, so the vehicle ay be driven for-ard or back at will by e simple movement of e speed lever in the sired direction just like ifting the current of an electric and without y shifting of the position of the rollers by e change pedal. This simplifies and sweetens e handling of the vehicle and adapts it to dies' use.

Powerful metal brake shoes rub in the rooves of the large rings and being rooved present large surface and great olding power. They hold even better

unless ordered wider are made the s dard gauge of 56 inches. The wheel b

Fig. 2. Plan of Duryea Buggyaut chassis showing the extreme simplicity o mechanism. Everything is he e shown ready to run with the exception of the The power plant consists of a two cylinder, two cycle air cooled motor mounted wi grooved friction, driving rolle s on a three point suspension. Inclined steering are used on the front wheels which are 37 inches in diameter. The rear wheel 43 inches. Wheel base is 80 for the two passenger and 84 for the four pass carriage. The rig complete weighs only 800 lbs. For details of the driving mech see text.

is 80 to 84 inches, depending on the n ber of passengers carried. The gaso tank, the battery and coil are placed in body under the seat, leaving the w bonnet for an excellent parcel box.

The weight of the mechanism bein the rear permits the passengers to carried in the most comfortable posi which is between the wheels.

Digitized by Google

chassis is sold separately for this purpose to those preferring a body different from the standard, or to the carriage trade who prefer to do the body fitting and finishing.

DIFFERENTIAL NOT NECESSARY.

Since there is no balance gear, some question its performance in turning corners, but Mr. Duryea calls attention to the common railway construction where the wheels must slip on the rails, and says that no balance gear is necessary because the driving rollers will slip as much as needed, but rather than expose the tires to any unnecessary friction he provides a method whereby the inner roller is releast in turning a corner and the outer wheel does all the driving. This device consists of an eccentric on the steering post and connection to the frame of the motor so that the front end of this frame is thrown toward the inner side of the turn. This is both simpler and superior to a balance gear.

Some have questioned the correctness of mounting the motor so rigidly, claiming that it will take damage from the road shocks to which the rear axle is exposed. However, according to Mr. Duryea's experience with motors, both spring mounted and otherwise, the simpler method is best. The motor and its shaft is so simple and so well trussed that it is practically a single piece, and far better able to resist shocks than are electric motors which are so mounted. Further it must be rigid enuf to take the explosion shocks and so is amply able to stand the road vibrations which are much less frequent and violent. While a starting crank may be applied to either end of the motor shaft, a ratchet starter is provided with cord to the floor of the vehicle, and thus the motor is easily started from the seat.

LUBRICATION.

There are but two bearings other than the wheel and motor bearings, and these being rollers need little oil other than what may reach them from the engine shaft. The wheels are ball-bearing and need oil but once per year. The engine shaft is lubricated by compression cups four in number, while the pistons and rods are oiled by a high test cylinder oil mixed with the fuel in the proportion of one gill of oil to a gallon of gasoline. This quantity is less than common to this method because of the superior lubricating qualities of the special oil used.

The entire absence of cams, gears, chains, gimbal joints, transmissions, clutches, pumps, fans and lubricating mechanism renders the vehicle quite free from noise and wear. The grooved rings wear faster than the hardened rollers, but being of large size are of long life and much cheaper to replace than a chain or pair of gears.

Mr. Duryea believes that this vehicle marks an era of simplicity of construction and it certainly seems to have taken a most advanced position in that direction.

A matter of interest to those living in the Far West is that the Buggyauts can be crated small enuf to ship at 2000 lbs. weight with corresponding reduction in the freight as compared with the usual vehicle which must pay on a minimum weight of 5000 to 8000 lbs.

Altho designed primarily for high wheels, smaller wheels and air tires can be used, making a natty little runabout. With a single seat for two passengers the buggyaut sells for $700. With folding rear seat, making the capacity four, the price is $750.

Former Sales Manager Ernest H. Brandt of the Corbin Motor Vehicle Corporation, has been appointed general eastern manager of the Cadillac Motor Car Co., with headquarters at 59th and Broadway, New York City.

Thomas H. McNevin, who has for seven months acted as Chicago representa tive of the Breeze Carburetor Company, Newark, N. J., was recently placed in full charge of the company's sales department and will remove to Newark. Fulton & Zinke, 1256 Michigan Ave., Chicago, will conduct the future business of the Breeze Carburetor Company in the west.

Hopewell Bros. of Cambridge, Mass., has opened in New York and will sell its tire cases and fabric line at 1900 Broadway, and has withdrawn its New York agency from the Allen Auto Specialty Co. and will maintain that territory through its own branch office, which is in charge at the present time of Mr. C. A. Russell, who formerly represented the company in the New England territory.

The Acme Spring Check Company, maker of the "Shocsorber," has recently been incorporated with a capital stock of $250,000. The company will have its headquarters in New York City, but will manufacture the Shocsorber in a Connecticut city.

Robert Burman, who for the past four years has been driving the Jackson racing machines for the Jackson Automobile Co., has joined the forces of the Geo. Jackson Motor Co., of 1720 Broadway, New York, local agents for the Jackson, and will drive for them in all the races in which the Jackson will be entered the coming season.

The Lockport Rubber Works, is the name of a new concern recently organized in Lockport, N. Y., under the New York State laws, with $300,000 capital. Chas. F. N. Kelley is President, J. Edwin Davis, Vice-President, and H. M. Wood, Secretary. This concern is at present building bicycle tires and sundries, but expects to build automobile and motorcycle tires, etc., later.

THE HESS-BRIGHT BEARINGS

Practically every automobile builder will admit that through the use of HB and DWF Bearings the running qualities of the car are brought to the highest possible standard, and perfect running is assured.

PROTECTION THROUGH HESS-BRIGHT GUARANTEE

Our guarantee to replace or repair, without cost, all damaged Bearings for one full year; to replace or repair, at pro rata cost for the second and third year, means that we assume all responsibility as regards the up-keep of HB and DWF Bearings for three full years. We supply the car builder with a printed Guarantee for each car—these to be distributed to Dealer or Owner. We supply brass Guarantee plates for attachment to each car.

To the Car Dealer our guarantee means *complete protection,* as he is relieved of all responsibility.

To the Car Owner our Guarantee means exemption from cost for repair, and protection for three full years against all bearing troubles.

Write for a copy of the Hess-Bright Journal.

Locomotive Automobile Company, of ch the first hundred are now being put service by the Waldorf-Astoria hotel New York, is found a new attitude to- d the economic aspect of the tariff cab city use. This attitude is the habitual of this company which believes that lding for long service is most economic the end, even at a slightly greater in- l cost.

Iaving decided to enter the field the erican Locomotive Automobile Company de an exhaustive investigation of the ious makes of cabs and the conditions

resistance to wear was the prime cons eration and the expense of material a construction secondary. Generally spea ing, the motor cab is built on the sa lines and of the same material and wi the same exacting methods as the Lo motive Company's touring car, the ch feature of difference being in the fi transmission of power from the gear ca to the rear wheels, which, in the case the cab, is not by chains, but by a sh drive. Imported materials are used in su important parts as cylinders, crank sha springs, frames, etc.

Fig. 1. The American Locomotive Co.'s Motor Cab. Motor 4-cylinder vertical 3 15-16 inches x 4¾ inches. 1 P. at 800 R. P. M., multiple disc clutch, low tension ignition Simms-Bosch magneto, no spark advance. En e speed controlled by governor. Wheel base 103 inches, tread 55 inches, weight complete 2600 lbs. Top conver le.

ler which they are operated, both here l abroad. The results of this indicated t the requirements of the service are ex- ing in such a way that a cheaply con- ucted vehicle is unlikely to be lucra- e. It was found to be the experience some companies that while the gross eipts were ample the net profit was nil, ing to the vehicles being in commission y about 50 per cent of the time, and that be finally profitable such vehicles should so constructed that they can be kept commission about 85 per cent of the

SPECIFICATIONS.

The general specifications of the cab a as follows. Wheel base 103 inches; tre 55 inches; height of frame from grou 24 inches; weight of cab complete 2,0 pounds; tires 32x4 inches all around; av able body space from dash to rear of fra 98 inches; width of frame 34 inches.

POWER PLANT.

The motor is of the four-cylinder ve cal type, placed forward of the dash un the usual form of bonnet, bore and str being 3 15-16-inch x 4¾-inch; nominal

peed of the motor is limited to 800 R. P. . This control it is claimed is extremely nsitive and absolutely reliable. It is beeved by the makers that it is desirable om the standpoint of maintenance and peration to not only limit the motor speed, ut the speed of the vehicle, as by so dog the life of the powerplant is increased nd the liability of accidents decreased.

The lubrication of the motor is effected ntirely by splash, oil being fed to the rank case by means of gravity thru a ight feed oiler. As a guarantee against ex-

Fig. 2. Front view of American Locomotive Co.'s Cab. H. P. Motor. Tires 34 x 4. Special spring suspension l luxuriously appointed body. The frame is dropped at middle giving easy entrance or exit.

ss of oil and consequent smoky exhaust, ollow plugs are provided in the bottom of e crank case to maintain a constant oil vel, any excess of oil being carried off to overflow tank thru these plugs.

Cooling is effected by an extremely efcient honeycomb radiator, the water beg circulated by centrifugal type of pump, hich has ample capacity to cool under ost trying conditions.

The transmission is of the sliding gear pe "selective," providing three speeds nd reverse, the high gear being direct. he reduction on the high gear is 3.8 to giving a vehicle speed of 20 miles per our with the maximum motor speed as ove indicated.

SPECIAL REAR AXLE.

The rear axle, a new design, is, perhaps, e most novel feature of the cab. The le proper, or the load supporting mem-

therefore transmitting the braking tor thru springs to the frame. A forward ho ing registered within the central ring ries the rear end of the driving shaft the differential mechanism, and being unit within itself, permits a reliable and curate means of securing proper alignme This housing terminates in a torsion carried at its forward end in a fork tively mounted on the tube, the functio which is merely to counteract the dri torque from the motor, and to keep rear axle in proper alignment with transmission. It is assisted in this w by radius rods joining the forward sid the brake anchor with brackets on frame, the centers of which are in a lute alignment with the torsion-tube ends and the center of the universal j carried on the rear end of the main ing shaft of the transmission. A li cover on the rear of the axle comple encloses all the gearing, bearings, etc., protects them from foreign matter of kind. This axle is of the well-known f ing type in which the wheels are mou on the outer ends. The weight suppor portion of the axle and the driving sh from the differential transmit their po to the ends of the hubs by means of clutches, therefore imposing upon t none but torsion stresses.

BRAKES.

Two separate and distinct sets of bra are provided, both acting directly on rear wheels, the one set expanding wi a large drum, and the other contrac on the outside of the same drum, the o one being the service brake and oper by a pedal, while the internal brakes the emergency brakes and are operate hand lever.

Special attention has been given to spring suspension as that feature ma so much for the comfort of the pass gers, and in addition, affects to a grea or less extent the life of the power pl The front springs are semi-elliptic, and rear are semi-elliptic on the sides wit platform spring joining the rear ends placed directly under the rear cross m ber of the frame.

The frame itself is raised at the rea provide sufficient clearance over the axle, and at the same time bring the portion near the ground, making it tremely easy for passengers to enter alight.

Hess-Bright, (D. W. F.) bearings

sible to replace any of the importan ments, such as front or rear axle, trans sion, motor, steering gear, etc., from ck without having to specially fit or up this part. Accessibility is an- er important feature in the design. It possible to examine practically all of working parts individually without dis- bing other adjacent parts. For example, clutch may be removed without disturb- either the motor or transmission; the nsmission may be removed as a unit in omparatively short time; and the same rue of the motor and rear axle.

LUXURIOUSLY EQUIPT.

Besides seeking to produce a cab to stand racking of tariff service in the city it been the aim to provide a vehicle which ll have the luxurious riding qualities of for the W. H. Seaich Company, which s plies the Waldorf-Astoria cab service, a not only handsome exteriorly, with th bodies finished in dark brown and the ru ning gear in yellow, but they are bu thruout of finest material and upholster and trimmed sumptuously. The wood wo is seasoned ash, with panels of sheet ste The door mouldings and glass frame fend are of metal, the door flappers being t Company's special pattern to hold t frames securely. The front, partition a the inside of the doors are lined with fancy wood veneer and the glass frames a of polished mahogany. The seat cushio etc., are upholstered in hand-buffed pebb leather, the floor is carpeted, the windo fitted with silk curtains and the door ha dles and other fixtures are of brass.

he 1908 Thomas Detroit Tourabout

The latest and one of the most attrac- e models turned out from the factory the E. R. Thomas Detroit Company is new tourabout. The car combines the ntness and speed of the Thomas-Detroit about with something near the carry- capacity of a touring car.

The rear seat, which accommodates two sengers, can easily be removed and a lected type equipt with Timken roll bearings and gives three speeds forwa and reverse.

The clutch is a leather-faced aluminu cone 16 inches in diameter with sen elliptic springs beneath the leather to sure easy engagement.

Ignition is by jump spark, current bei generated by double batteries. Provisi is made for the attachment of a magnet The tourabout weighs about 2400 poun and is flexible and easy to control.

The New Thomas Detroit Tourabout. Altho as light and speedy as a runabout, this car has almost th rying capacity of a touring car. Its motor is the standard 5x4¾ inch 40 H. P., as used in the other models e change speed gear is of the three-speed selective sliding type.

gle rumble seat with tool box or a trunk stituted.

The motor is a standard Thomas-Detroit ty with four cylinders 5 inches x 4¾ hes. Timken Roller and Hess-Bright l bearings are used throughout except the crank journals and on the connect- rods, where die pressed tin babbitt rings are used. Unusually long and

Stilson Hydraulic Clutch

The Stilson Motor Car Company, of Pittsfield, Mass., has brought out a clutch of the hydraulic type, of which the following is a brief description. The accompanying drawing shows an axial and transverse section of the new clutch. The Spider A is fast to the engine shaft and carries the two spur pinions B, B. These are in constant mesh with the spur gear C, which is fast to the driven shaft. The spaces H H H H are sections of a liquid casing, which is filled with oil. The arrangement is such that the gears and the oil spaces constitute a gear pump tending to circulate the surrounding oil. Several valves, one of which is shown at D, when opened, allow of the free circulation of the fluid through passages not shown, but when D is closed the oil is impounded and practically no relative motion is possible between the pump members. When the valves are opened and oil is by-passed freely the pinions B on the engine shaft simply run idly around the central gear C and no torque is transmitted to the driven shaft. When, however, the oil valves are partially closed the resistance between the pump members becomes considerable to the gear C and the pinions B drive the gear C and the driven shaft with only a slight amount of slip due to oil leakage.

The clutch is operated in the conventional manner by the release of a pedal. The spring F then acts and brings the ring K into contact with the ball bearing heads of the oil valves D, which have previously been held fully open by their springs. As the valves are more or less closed by the release of the pedals, the clutch torque increases, due to the pump work consequent upon the impounding of the oil, until they are entirely closed, when the clutch shaft revolves at about 90 per cent. of the engine speed. A still further motion of the clutch causes engagement of the leather-faced conical surface G and locks the clutch to the engine mechanically.

AUTOMOBILE TRADE JOURNAL

Stilson Hydraulic Clutch, operated in the usual manner by foot lever. This clutch is for use in starting and is not intended to do away with the change gears. It gives gradual starting at all engine speeds and is mechanically engaged when fully in.

Asbestos Wood

Professor Charles L. Norton, of the Massachusetts Institute of Technology, after several years of laborious research has succeeded in producing an asbestos wood which, while being fire proof, is harder than ordinary wood and takes a higher polish. In the motor car field this material will find many uses such as in the construction of garages, of compartments in factories, fire proof doors, etc.

Its uses in the electrical field are almost unlimited and for these purposes an ebony asbestos wood is furnishel which is of somewhat similar structure, but is saturated with a special insulating compound which causes it to take on the appearance of ebony. Ebony asbestos wood has a smooth, hard surface similar to hard rubber and takes a polish equal to hard rubber or marble. It is therefore well adapted to use in the manufacture of switch and panel boards, fuse bases, insulating barriers, duct linings, rheostat tops, etc. Both kinds can be worked with ordinary wood working tools. Prices on the plain asbestos wood range from 20 cents per square foot for the ¼-in. material to $1 per square foot for the 2-inch thick. The ebony wood lists at 40 cents to $1.60 per square foot according to thickness. This material is made by H. W. Johns-Manville Co., 100 William street, New York City.

The Dayton Electrical Mfg. Co. of Dayton, Ohio, the well known manufactures of Apple Ignition Apparatus and Storage Batteries, has found it necessary on account of the phenomenal growth of the lead burning and assembling departments of its Storage Battery equipment to enlarge and improve its old quarters.

The "Cowles" Carbureter

The Cowles carbureter, which is here shown in sectional view, is manufactured by E. P. H. Cowles, 131-135 Belmont street, Warren, Ohio. This carbureter is of the automatic type, and will be made in a number of sizes, determined by the maximum area of the air valve opening. At present only one size is being made, and that with a one square inch opening. This is known as No. 1 and lists at $25.

The carbureter consists of an improved nozzle, air valve, oil valve and combinations of the same. 6 is the mixing chamber and 7 the valve chamber or base. Air enters at 8, gasoline at 9, while the mixture is taken out at 10. The gasoline that enters at 9 passes into the vertical tubular chamber 11, where its passage to the nozzle 12 is gauged by the needle valve 13. This valve consists of a cylindrical stem sliding, oil tight, through a bushing, 14. A head on the lower end of the valve rod seats in the lower end of bushing 14, so that when it is drawn up it cuts off the flow of gasoline.

One or more V-shaped grooves, 13, are cut in the valve rod, their upper ends being ⅛ in. above the upper end of bushing 14, when the valve rod is down. Their lower ends are V-shaped, the point of the longest terminates just above the head on valve rod, the points of the others terminating successively where the straight part of next longer one begins, thus the flow of oil increases gradually as the valve rod moves down or decreases as it moves up, so that when the stream is fine its section is an equilateral triangle with outwardly curving sides, making practically a solid round stream. This admits of gauging the liquid with extreme accuracy, particularly when the quantity is small. The reason for more than one groove is to better balance the valve rod.

The nozzle consists of a cone-shaped annular chamber, 15, connected to the tubular chamber, 11, by radial arms, 16, conduits through these arms allowing the gasoline after passing through valve 13 to flow into annular chamber 15, where it is discharged in an annular film at the top of nozzle, 12.

The air after entering chamber 7 is divided into two blasts, an annular blast at 17 passing outside the chamber 15 and an inner blast passing thru 18. Their passage is controlled and regulated by a double valve, one annular, 19, sliding air-tight thru the base of mixing chamber 6, and seating on the upper outside part of chamber 15, the other cone-shaped, 20, seating in the upper inside part of 15. Its stem, 20, is bored out to admit valve stem, 13, by which it is operated, and both extend up thru the lid of mixing chamber 6. These two valves are operated by the arms of a rocker shaft, 21, one arm lowering 19 and the other raising 20, or vice versa, their lengths being inversely proportioned to the area of the valves so that they balance each other under any pressure. One end of rocker shaft, 21, passes outside of chamber 6, and has an arm, 22, to operate it. Valves 19 and 20 and chamber 15 are shaped to cause the two air blasts to converge and meet with great force, catching the gasoline between them directly over the nozzle, as shown by the arrows, forming a cyclone which effectually wipes up

Sectional view of the "Cowles" carbureter; numbers explained in text.

and atomizes the gasoline and thoroly mixing it with the air, after which the mixture is projected up in the centre against the lid, 37, where it is deflected down the sides of mixing chamber 6, passing under their lower edge at 38, all around into the annular passage, 40, and out at 10. Optional with the purchaser an auxiliary air valve 41 is provided, which when raised, admits air from chamber 7 thru passages 42, cut in the outside of main air valve, 19, into the mixture as it passes under the edge at 38. This valve is operated by links 43-44, connected to the arms of a rock shaft, 45, passing centrally thru 21. The lower end of outside link, 4, is connected to the pivot of plates 34 by a

Hosted by Google

slot which permits these plates to move half way down before operating link 44 and valve 41. Thus valve 41 remains tightly closed and inoperative, except when main valve 19 is about half closed from excessive speed and light load, but when it closes from slow speed and heavy load valve 41 is inoperative.

The shelves along the inner edge of the chamber 6 are for the purpose of catching any unatomized globules of gasoline and conducting them down into the sump, 23, from which they are drawn back into the chamber 15 thru passage 24. Nozzle 12 extends beyond the air valves into chamber 6 and is consequently always fully exposed to the vacuum therein. The two converging blasts of air meeting with great force directly over nozzle 12, produces an induced suction on this line which causes the vacuum in chamber 15 to be greater than in chamber 6 or passage 10. This produces a current from sump 23 thru passage 24 into chamber 15, and carries any gasoline in 23 with it. The air drawn thru passage 24 only serves to assist in more perfectly atomizing the gasoline that passes thru nozzle 12. This feature, in connection with the vigorous and extended action of the double air blast makes it possible to use a much heavier gasoline with this carbureter. Nozzle 12 is practically 2½ in. long, with a thin air blast on each side which converge and meet directly over it, catching the gasoline between them.

To counteract the varying proportion between the air and oil drawn in by vacuums in chamber 6 of different degrees of intensity, a diaphragm, 26, is attached by its lower side to the end of valve rod 13. The upper side of the diaphragm is loosely held in a cage, 28, which is connected to the upper end of the tubular stem of air valve 20, by a quick motion screw secured by a jam nut, 29. A passage, 27, communicates between chamber 6 and diaphragm 26, so that it is always exposed to the same vacuum that exists in the former. Thus the relative positions of oil valve and air valve varies with the vacuum in chamber 6, keeping the proportions of oil and air correct at all times. By turning knob 30, the jam nut 29 is slacked and diaphragm cage, 28, can be turned to vary the richness of the mixture.

Preferably lever 22 would be operated by a centrifugal governor with a spring tension to regulate speed so arranged that normal speed would maintain it about half open, when the speed fell below this by reason of the motor being overloaded, or from any other cause, the air valve would remain wide open and the air blasts might become too weak to properly atomize the oil. To obviate this, a device shown on the lower right side is placed between the governor and arm 22. It consists of a plate, 31, permanently attached to any part having parallel slots, 32, 33, in which two plates, 34, on either side, slide parallel with the connecting rod by means of rollers running in said slots. Diametrically opposite the pivot roller two links are attached to plates 34; one, 35, leading to the governor; one, 36, leading to arm 22. When the speed is normal or above, plates 34 travel along slots 32 and 33, and with 35, 36 act as an unbroken rod, but when speed falls below the normal, the pivot roller abuts against the end of slot 32 and acts as a pivot about which plates 34 turn and reverses the motion of rod 36 and the valves, causing them to gradually choke the air blasts and maintain sufficient force to atomize the gasoline at all speeds. When the motor is stopped it automatically closes all valves tightly. Any surplus gasoline, as from leakages or other cause, fall to closed receptacle, 25, from which it can be removed as desired.

The entire assets of the bankrupt Shoemaker Automobile Co., of Elkhart, Ind., have been purchased by St. Joe Motor Car Co., which will continue the manufacture of Cars, both pleasure and commercial, at Elkhart, marketing its product under the name "St. Joe." The leading model will be a 40 H. P. car listing at $2,500, fully equipt. C. S. Conover is president of the St. Joe Company; O. G. Sellers, vice-president; M. L. Feckler, secretary and treasurer; Scott Van Ettan, superintendent.

In order to save American tourists the trouble of filing a bond and making a deposit of $25 on entering Canada, A. J. Chester of 110 Cromwell street, Sarnia, Ontario, Canada has made arrangements to relieve Americans of these details for the small fee of $3.50. He has filed a Surety Company's bond with the collector of customs at the port of Sarnia and a tourist can avail himself of the benefits of this bond by mailing Mr. Chester details regarding his car together with the required fee. A bond filed at Sarnia permits a car to enter any port in Canada.

Iver Johnson Sporting Goods Co., one of the largest jobbers and retail dealers of sporting goods and automobile supplies in New England and now located at 163 and 165 Washington street, Boston, has in course of erection an eight-story, fireproof building at Washington and Summer streets which it expects to occupy June 1. This company also markets a fuel strainer-funnel for automobilists and an anti-skid device of its own manufacture. The new building has foundations of sufficient strength to carry two additional floors, which will no doubt be needed in the near future. Besides the basement, there is a sub-basement, to be used for storage and the heating and ventilating apparatus.

GOODRICH TIRES

will carry more cars in 1908 than they did in 1907—possibly more cars than any other make of tires in America. The fact is of no interest to the individual motorist except as an indication of the experience of a very large number of other motorists. No one sticks to a certain make of tire through sentiment;—no product receives such cold-blooded testing as the automobile tire. Hence, the fact that Goodrich Tires are being chosen by the majority simply means that their merit has been *proved* by experience.

The outcome of almost every important road test for 1907 is an invitation to specify Goodrich Tires.

"Steamtite Cement" for Cracks

"Steamtite cement" is a specially pre
pared compound made by the Clark Cast
Steel Cement Company of Shelton, Con
necticut, for the purpose of repairing
cracked cylinders, radiators, tanks, etc. It
consists of a fine metallic powder which
when mixed with a liquid chemical fur-
nished with the outfit forms a cement
which is absolutely unaffected by water,
steam or oil. In fact it is claimed it will
set hard in boiling water. In setting it
expands so much that it will stop a crack
or leak absolutely tight against a water
pressure of 3000 lbs. To apply the cement
some metallic powder is mixed with the
liquid chemical until the mixture is the
consistency of a very dry stiff putty or
dough. The cylinder is then heated to
about its temperature when the engine is
running, when the cement is forced very
tightly and carefully into the crack so that
if possible it will protrude on the inside
and when it expands in setting it forms a
shoulder on the inside to better resist the
pressure of the water from within. In the
New York to Paris race each car carries
a quantity of this cement, which has al-
ready proved its usefulness in one case.
It happened that during the first few days
of the race the Zust car cracked a cylinder,
which was promptly repaired by means of
this cement. The effectiveness of the
cement so impressed the owner of the car

The 1908 "Ross" Windshield

The Ross windshield is designed to fold toward the wheel on any style car, and can be folded up or down from the seat. A special brass double hinge is provided for folding, which holds the frame rigid when up by means of angle brackets on opposite sides. These angle brackets being slightly tipped, allow the use of a knurled hand-wheel. By removing the two hand-wheels, the top section is folded toward the wheel operating at the two centre hinges the same as the single hinge type, but the auxiliary hinge above the centre allows top section to extend out over the lower section clearing the wheel, and then the top section is folded down and fastened to bottom section by the same two hand-wheels by the same method as used on the single hinge type. By this method the glass in upper section is supported when folded down by the wide part of the frame at the top. The corners of the top section are rounded to conform to the rounded corners of bottom section where it is fitted to dash. The hinges and brackets are bolted together through the frame by brass machine screws. Three-sixteenth selected polished plate glass is used exclusively. The glass is set in grooves and filled around with felt, making it impossible to crack it thru jarring. The windshield is manufactured by H. S. Ross, 5607 South Halsted street, Chicago, Ill.

The standard sizes are 42 in. wide by 32 in. high for the plain type front without filler board, and 42 in. wide by 36 in. high, using a 6 in. board at the bottom to be cut to fit the dash of car. On cars of round dash or other form requiring it, the frame is made with a filler board wide enough to fill in the corners of the dash. The frames are made in either quarter-sawed oak or mahogany finish. All trimmings are made of brass, highly polished. The price of the single hinge type without filler board is $35.00, and with filler board $37.00. The price of the double hinge type with filler board cut to fit the dash is $40.00.

The 1908 "Ross" Windshield.

The "Rex" T Socket Wrench

The Rex wrench is made particularly for automobiles and launches, and has the particular advantage of allowing the user to tighten nuts in out-of-the-way places in which they could not be reached by the ordinary wrench. The outfit consists of a full set of interchangeable steel sockets of special form and a handle to which the sockets may be firmly and instantaneously locked at any desired angle. The sockets are in a series comprising the standard sizes of nuts. The cross-bar in the handle may be set firmly in any position that gives the best hold for getting into corners. A screw-driver and spanner wrench attachment is also furnished, the same being fastened to the handle in the same way.

The wrench is manufactured by the Rex Wrench Co., Boston, Mass., in blue mottled steel finish, listing at $5.00, and in nickel-plated finish at $6.00.

The "Rex" T Socket Wrench.

We are informed that eighteen out of the twenty-two cars entered in the recent Briarcliff Trophy Race, and the entire American crew used Bosch Magnetos and that in the race from New York to Paris, the Thomas, Zust and Protos cars are using the Bosch.

An addition will be made to the factory of Mason Motor Car Co. of Des Moines, Iowa, this summer, to consist of a 2-story structure measuring 44x150 feet. It will enable the company to increase its output from 10 to 16 machines per week. The assemblying, painting and upholstering departments will be installed in the addition and about 40 more employes added to the force.

BIGGEST THING ON THE HIGHWAY

WOODWORTH

ADJUSTABLE **TREAD** DETACHABLE

The Woodworth Tread is not a new untried novelty or a mere theory, but a ensible practical useful tire protector that has been thoroughly tested for years on housands of cars running millions of miles on all kinds of roads in all parts of the ountry and under all possible conditions.

Woodworth Treads are made of three thicknesses of chrome leather that will not tretch or crack in any kind of weather or hard usage. They put an end to tire troubles nd save more than half the tire bill. Positively will not chafe or heat the tire.

Puncture-proof against nails, sharp stones or glass. With rational care make kidding practically impossible.

WOODWORTH SPECIAL TREAD. For rocky and rutty roads we make a pecial tread with oval-headed steel rivets set closely along the sides.

izes and rices as follows:	26x2½ $10.00	28x3 ..... $12 00	30x4 ..... $16.00	34x4 ..... $19.00	36x3½ $19.00

The "American" 20-Inch Lathe

The 20-inch, 3-step cone lathe here i lustrated is the product of The America Tool Works Company of Cincinnati, Ohi who manufacture a number of machin tools that are particularly adapted to th requirements of automobile factories an repair shops. No one type of engine lath is of course adapted to all classes of wor and the automobile trade requires machine of great power and capable of rapid handling heavy cuts on nickel steel an other tough material as well as being a curate and productive of highly finishe machined parts. To meet these requir ments The American Tool Works Com pany has brought out a line of doub back geared lathes with 3-step cone pulle like the one here shown, these machine being made in 14, 16, 18, 20, 24, 27, 30 an 36-inch sizes.

This lathe is of very heavy constru tion, and is liberally supplied with ste gears. The double back gears are quick engaged or disengaged thru a convenien eccentric lever and with the three-ste cone pulley afford a nicely graded rang of spindle speeds, particularly valuable fo manufacturing purposes.

The three step cone pulley permits eac

ber covered webbing. This battery is made in nine sizes as follows: 4, 6, and 8 volts, 40 amperes; 4, 6 and 8 volts, 60 amperes; and 4, 6 and 8 volts, 90 amperes. The 6 volt, 40 ampere battery is particularly adapted for two cylinder engines. It is 7¼ inches long, 4¾ inches wide and 7⅜ inches high, weighs 19 lbs. and lists at $15.00. The 6 volt, 60 ampere cell is recommended for 4-cylinder motors. The size is 7¼ inches x 6⅝ by 7⅜ inches. The weight is 29 lbs. and the price $25.00.

"Perfection" and "Standard" License Number Indicators

The accompanying cuts show two types of adjustable automobile license number indicators manufactured by the Automobile License Indicator Co., Lewisburg, Tennessee. The main feature of these indicators is that they can be used in any state and can be instantly changed to any number from 1 to 99,999.

The "Perfection" indicator consists of a metal casing, made of brass or aluminum. The front of the indicator is provided with a sight opening, which is covered against the access of dirt and water by a sheet of transparent celluloid or mica, held in

Method of operating the "Perfection" Automobile License Number Indicator.

place by a skeleton frame riveted to the casing. The casing is formed with tubes at each side in which are mounted on a shaft a series of telescoping tubes, to the outer ends of which are secured milled disks, and to the inner end of each tube is fitted a spool to which ribbons are fastened. On the first five ribbons are printed in type 4 in. high and 1½ in. face. the ten numerals, and on the sixth, or right hand, is printed the name or abbreviation of all the States of the Union. Under each name is printed "Official No. ——," in which can be inserted the license number of the State to facilitate the proper adjustment of the numbers before the sight opening. The indicator shaft is provided with a stationary disk at the central division, thus permitting a change of any of the characters displayed on either side of the division without disturbing the adjustment of the opposite side. The ribbons of the indicator are made from good, serviceable white opaque fabric, non-stretchable and waterproof. The size of the indicator is 16½ in. long by 5½ in. wide.

The "Standard" indicator is constructed similar to a card index file. The indicator consists of a removable cap cover made from brass or aluminum, with the front having a large opening cut therein and covered with a sheet of transparent celluloid, and with the cap fitting closely over the top the indicator is dust and waterproof. The back section of the casing is formed with inwardly extending folds dividing the case into seven divisions or pockets. Each of the five central pockets contain ten

Method of changing the figures of the "Standard" Automobile License Number Indicator.

cards of celluloid or parafine-coated cardboard, properly indexed and showing on the face the ten numerals. In the end pockets are carried also a series of cards, showing on the front face names or abbreviations of all the states. A blank for a Certificate of Registration, which provides a means of citing authority for the license number displayed and means to distinguish numbers of one year from another, is also provided.

The Kimball Tire Tongs

Kimball Tire Case Co., 163 Broadway, Council Bluffs, Iowa, maker of the Kimball steel tire protector, is furnishing a pair of tongs for applying the Kimball tire clasps or armor on a tire. With these tongs the flat steel sections of which the Kimball protector consists, can be put on without deflating the tire. This tool is intended more especially for use where

The Kimball Tire Tongs.

only a few of these clasps are to be applied as in the case of a weak spot to be protected. Where more than four or five clasps are to be put on it is better to deflate the tire and press the clasps in place on the clinch by the use of a screw driver. The tongs list at $1. The latest Kimball tire case was described in our November, 1907, number, page 266.

Alexander Winton, President of the Winton Motor Carriage Co., announces that his company will continue the manufacture of six-cylinder cars exclusively in 1909.

Oxy-Acetylene Welding by Philadelphia Company

Probably the most interesting department of the American Ferrofix Brazing Company, 2024 Cuthbert street, Philadelphia, where large numbers of broken automobile castings and parts are repaired, is that where the new Oxy-Acetylene welding work is done. This company, with the Davis-Bournonville Acetylene Development Company, had their representatives visit the various welding centers of England, France and Germany, and from the experience obtained designed an Oxy-Acetylene welding equipment, which, it is claimed, embodies all the advantages of the various systems without their defects. As this system is very little known in the United States, a brief description of the method is herewith given:

The acetylene is generated in a specially designed and patented pressure generator. The oxygen is generated from chemicals which may be bought in the open market, in an exceedingly simple manner, and is passed through washers to be purified, and then into a gas holder. From the gas holder it is compressed into steel cylinders, holding fifty or one hundred cubic feet. The complete oxygen generating apparatus and compressor can be installed in a room 6 ft. by 8 ft. by 8 ft. high.

The oxygen is taken from the tanks through a reducing valve to a blow-pipe, as is also the acetylene, and the two gases are thoroughly mixed in the nozzle, so that they do not come in contact with each other until almost at the point where the combustion takes place. After the acetylene is generated and the oxygen turned on at the proper pressure, a flame is obtained having a temperature of about 6300 degrees F.

When it is remembered that the melting point of steel is about 2570 degrees F., and that of copper 1929 degrees F., some idea of the welding possibilities of this flame may be obtained.

One of the greatest advantages of the flame is that it can be made oxidizing, carbonizing or neutral, as desired, and when set will remain unchanged. As the inner cone is protected by an outer envelope of hydrogen, the metal fused by this intense heat is protected from the atmosphere.

This method of welding will undoubtedly revolutionize automobile construction, for with it many parts heretofore riveted or brazed may be welded at not only less cost, but with greater strength. Auto frames may now be assembled without rivets. Tanks can be constructed at less cost than by riveting, and without the slightest danger of ever leaking along the seams.

While metals of practically any thickness may be welded by this flame, at the present cost of oxygen and acetylene, it is not found economical to weld thicker than three-fourths inch metal, but under three-fourth of an inch all of the commercial metals, it is said, can be united, not only neater and stronger, but in almost every instance cheaper than riveting.

Full particulars regarding this system of welding and cost of installation of plants may be obtained from The American Ferrofix Brazing Company, 1515 Sansom street, Philadelphia, Pa., or the Davis-Bournonville Acetylene Development Co., 90 West street, New York City.

"Godfrey" Camping Outfit for Tourists

Charles J. Godfrey Co., 10 Warren street, New York City, is marketing a camping outfit gotten up especially for the use of automobilists. The outfit is packed in a strong fiber case measuring 30 x 11 x 10 inches, which can be carried on the running board of the car without causing any inconvenience, as it can be used as a step, being practically indestructible. In the camp it can be used as seats for the tourists.

The camp outfit includes a tent, ground cloth, pole and stakes, pair of blankets, 2 steel folding stools with canvas seats, "Jewel" kerosene stove, water bottle, folding bucket and a complete aluminum cooking outfit. The cooking outfit comprises 7 and 10-pint cooking pots, 9-inch frying pan, 4-pint coffee pot, two 9-inch plates, two 1-pint soup bowls, 2 dessert spoons, 2 cups, 2 knives, 2 forks, 2 teaspoons and a waterproof bag to hold the set. Each utensil is formed of one piece of aluminum, and there are, therefore, no seams or joints. All the pieces nest snugly in the large cooking pot which is carried in the waterproof bag.

The tent is made of waterproof silk and the ground cloth of waterproof duck sewed to the tent. A single, jointed pole is used fitted with brass ferrules, which make it easy to put the pole parts together or take them apart. The blankets are of wool and measure 72 x 84 inches. The folding seats each measures 8 x 12 x 18 inches, open, and folds into a package 8 x 11 x 1½ inches. The stove can be "knocked down" for packing and when packed occupies a space 8½x8½x5½ inches. The burner can be unscrewed and a plug screwed into the tank. The water bottle and folding bucket are made of waterproof duck. The bucket holds 3 gallons and folds to less than ½ inch in thickness. Price of this outfit for two persons as described is $60. A larger outfit for 5 persons is furnished for $100. The tent is 6x7½ ft.

Willard R. Miller, President of the Miller Motor Company, Bridgeport, Conn., died suddenly with apoplexy at his home in Stratford.

For Town Cars No Engine Can Ever Compare With The Valveless Two Cycle

Elmore
VALVELESS 2 CYCLE

The inherent faults of the four cycle car—intermittent application of power, valve trouble, complication and cost—are **emphasized** in the four cycle enclosed car.

They are likewise eliminated—entirely—in the Elmore two cycle, valveless Taxicabs and town cars.

In drastic street, park and hill emergency tests in New York, with the best other town cars built, the Elmore literally ran away from competition.

The same thing happened in Boston—the same thing will happen in every city in the country in which the valveless, two cycle engines of the Elmore Town Cars and Taxicabs come in active comparison with other types.

The valveless, two cycle Elmore has come into its own—in point of steady sales, success and owners' enthusiasm, it is the foremost car in America today.

A ten-minute talk with your agent and a twenty-minute demonstration will make you marvel that you have ever rested content with any car less perfect and more expensive to operate.

1908 literature if you wish it.

Gasoline Vehicles

CHAS. E. DURYEA

ENGINE PERFORMANCE AT 14,500 FEET ABOVE SEA LEVEL.

LA PAZ, BOLIVIA.

La Paz, Bolivia, is situated about 14,500 feet above sea level, and I calculate that at this altitude the average gasoline engine loses almost 50% of its efficiency, and that a steam engine loses almost as much.

At 14,500 feet the air is very rare and in consequence of the lack of oxygen in the atmosphere the mixture which enters the cylinders is naturally very heavy and the explosion, when it occurs, is very feeble as the component parts of the mixture are not proportionate. An automobile rated at 40 H. P. will not perform the functions claimed by the manufacturers and will not climb a hill having a gradient of 20% even when equipped with special gearing.

What formula could be used to compute the loss in efficiency on account of altitude? 2% for every thousand feet is all very well for altitudes as high as 8 or 10 thousand feet, but above that my calculations have "gang aglay." What formula could I use to calculate the loss in efficiency of steam-driven vehicles, and in fact all classes of steam engines? D. M.

You are mistaken in supposing that the composition of the air has changed at the height you mention. Many accurate analyses have been made of samples of air brought down from heights beyond those attained by living beings and they all show the same composition as pure air near the earth. You may be quite right that the mixture is not correct. It seems to be quite certain that a carburetor which has been developed to handle a dense atmosphere will not properly mix the same gasoline with a light atmosphere. It is probably true that the liquid while of the same weight will vaporize much more readily and that this further tends to throw the mixture out of proportion.

I have had no high altitude experience myself and writers seem to differ as to what happens and what is needed to get the power. There is air and fuel there and they can be made to do work properly and economically if the engine is right. The comparative pressures are best shown by a barometer and you can get at the air pressure in pounds per sq. in. by multiplying the barometric inches by .49. The power you ought to get out of a gas engine will be less than at the sea level as the air pressure is less. In fact it ought to vary just as does the barometric pressure. But since the engine has been built for one level and not changed for another, the power actually developt probably is less than proportional. It is well known that engines are slightly less efficient as the compression spaces are made larger. Reducing the density of the charge not only lessens the amount of working material but it decreases the compression and the working pressure and so reduces the economy of such charge as can be drawn in. It ought to be possible to increase the compression by filling the compression space about half full of iron and so avoid the loss of economy mentioned. Then the engine should give power compared with the sea level in proportion to the barometer. You are nearly 3 miles high and as the pressure decreases roughly ½ pound for each thousand feet, your barometer will indicate about 8 pounds. At 3½ miles the pressure is but half of the sea level pressure and an engine built for that level can only develop ½ as much power as the cubic contents would indicate. Your belief is therefore not far from right so far as it applies to the gas engine. To figure the loss, we must assume the engine to be built for the altitude and then the decrease will be 1-30 or 3⅓% per thousand feet.

But the steam engine is a different problem. Here you have to consider grate surface, flue sizes and stack capacity. These will handle less air as the pressure is less and the same percentage will apply. But if you get the steam in the boiler, the engine will do its duty better than at a lower level for it can exhaust into a partial vacuum without using a condenser. The remedy would seem to be the use of forced drafts and by faster speeds get the same quantity of air thru the fire.—C. E. D.

BACK FIRING INTO CARBURETOR.

PITTSBURG, PA.

Would be greatly obliged if you would explain, through the columns of your next issue, the cause of a gasoline engine firing back into the carburetor. WESLEY HOWELL.

The usual cause of backfiring is a mixture too lean. A proper mixture burns explosively and the fire goes out as soon as the gas is allowed to expand. If lean or over fat, it will burn very slowly and exhaust as flame and some of it will still be burning as the next charge enters. This fires the fresh mixture and it fires back toward the carburetor. Other things may cause this. If your spark occurs in one cylinder at the time the charge is passing in, it would backfire practically every time. A hot bit of carbon too small to hold heat enuf to cause what is called preignition may remain hot till the suction begins and do this mischief. If an inlet valve does not close, the charge will escape and the spark will fire what remains of it and communicate it to the pipe. But making the mixture richer is the first thing to try.—C. E. D.

ON GRAPHITE LUBRICATION.

ELGIN ILL.

would greatly appreciate, a full expression of Mr. Duryea's ideas, in regard to graphite, as an aid to the lubrication of auto, gasoline engine cylinders. How should it be used with 4-cylinder vertical engine splash feed? Should it be mixed with oil put in crank case or passed through force feed oiler? What are graphite's greatest advantages and disadvantages as regards cylinders and valves? E. J. VAILL, M. D.

Graphite seems to me to be an ideal lubricant because it will not burn, smoke, carbonize or get gummy. Further it seems to fill up the pores of the iron and then the friction is that of graphite against graphite instead of metal against metal. Of course it is the intent to have always a film of oil between the two metal surfaces but oil in a hot engine gets very thin and either squeezes out or evaporates and leaves the walls dry. I have driven up to a stopping place with oil flowing freely and smoking a cloud but with the engine turning freely, only to be unable to start ten minutes later because the oil had all evaporated from the walls leaving them so dry and sticky the engine could not be cranked fast enuf to make a magneto spark. Graphite would not disappear like that. I have used graphite lined bushings for thousands of miles with no attention whatever and altho they did not run quite so freely as an oiled bearing, they more than made up by their freedom from attention and dirt. I have experimented with an engine having no oil about it and secured fairly good results. I am not sure but that some day we will have that kind. The fault I found was that with no oil on the rings, it would not hold compression so well as an oiled engine and this stopped the experiment for the present. So much for the advantages. The thorn of the rose lies in the fact that it is difficult to feed if mixt with oil. It settles to the bottom of the oil cups and clogs them. It goes to the bottom of the crank case along with the grit one prefers not to stir up. If fed thickly mixed with oil the oil disappears leaving the graphite as a paste which may be too thick to flow and one part of the bearing will get dry and cut while another will be all right. My experience indicates that you want an all graphite lubrication or else practically an all oil one but that a little graphite will greatly improve the latter. I like to squirt a little graphite into each bearing and cylinder every morning. Also a little into the crank case on top of the oil. In this way there is a little graphite each day hunting for a rough spot it may fill up. The Dixion Co. recommends dropping the oil into a cup containing graphite and letting it flow from the cup into the part to be lubricated. They claim this oil will stir up and carry with it a little graphite and that this little is all that is needed.

A new prophet in this field has lately arisen. The International Graphite Co. of Niagara Falls are putting out an artificial graphite so fine that it remains suspended in oil or even in water and so can be fed as is oil. I have not tried this but will do so in the near future. They say it is so fine that the best American filter paper will not clarify the water. It is claimed by some that the artificial and the natural amorphous graphites are not so slippery as the natural flakes.—C. E. D.

LONGER STROKE MORE POWER AT SAME NUMBER OF REVOLUTIONS.

INMAN, KAN.

How much power could we expect a 5 x 7 motor to develop at 1,000 R. P. M.? What advantage if any or what increase in power between 5 inch stroke and one of seven inches, bore being equal? O. W. S.

1000 R. P. M. is a pretty high piston speed. It is not common to run an engine of that size more than about ¾ this fast and in fact most of them run much slower. So long as there is not some limiting feature like the piston speed, the power will increase as the stroke is increased because the quantity of mixture taken in is increased in this same proportion and it is what makes the power.—C. E. D.

PROBABLY A SUPPOSITION CASE

CLEVELAND, O.

With a car standing on a hill steep enough to slide down, with the rear wheels locked tight, will it climb up with sufficient power to revolve the wheels forward on a dry road? H. KNUDSEN.

the hill is so steep that the car slides with locked wheels it is certain that applying the power will not make them stick and propel. Ordinarily applying power will start wheels to slipping if nearly at that point.—C. E. D.

PISTON SPEEDS LONG AND SHORT STROKE MOTORS.

FREDERIKA, IOWA.

I would be much pleased if you would enlighten me on the following:

In a catalog of a very popular motor car manufacturer, I find the following statement:

"A piston having a six (6) inch stroke travels only half as fast as one having a three (3) inch stroke on a shaft making the same number of revolutions."

On what principles is the theory based? C. E. CARR.

This statement as it stands is self evidently wrong. Probably what was intended to be stated was, that at the same R. P. M. a 6 in. stroke piston travels twice as fast as one having a 3 in. stroke, instead of half as fast.—C. E. D.

SHALL I CHANGE THE ARRANGEMENT.

I have a car with 4½x7 inch two cylinder opposed engine which should develop about 18 H. P. The engine seems to be in good condition, yet I cannot get enough power out of it. Could you tell me what might be the cause of it. The carburetor is about 18 inches above the intake and about two feet away. The oil feed is on top of the crank case and the exhaust from cylinder 2 comes straight into a tee. In your opinion would it benefit any to lower the carburetor and bring it closer to the intake, or would the changing of exhaust pipe at the tee help? How much H. P. do you figure this 4½x7 should give?—J. P. M.

It is a safe guess that the makers of the car had as good an arrangement as can be found and that if there is trouble it is not in the original arrangement. The best thing is always to bring the mechanism back into its original form and efficiency; and then, having it as good as it ever was, if you feel that it can be improved by making a change, try it but do not burn the bridge behind you. Leave it so you can put it back if it is not an improvement. I have seen so many cases where an owner at once went to "improving the rig" with the result that he never was happy and the maker got the blame. I do not favor a high carburetor but the only objection to it is the tendency for the liquid to flow into the cylinders. A small vent hole or cock in the pipe will fix this. The engine ought to give 15 H. P. Make sure the valves are timed right and that the compression is good. Try it with the muffler off. There is probably something not as the maker designed it and if you will find and fix that you will be all right.—C. E. D.

WANTS RIG FOR TRAVELING SANDY ROAD.

I have the contract for carrying the mail 24 miles and return daily on a route in Florida. The road is very sandy and during seven months of the year is quite bad on ordinary vehicles. The other five months it is wet and pulls much easier. I wish to know if it would be practical to handle this route with a light runabout or some kind of a gasoline vehicle. There are no automobiles here and I am advised by some that they would be entirely impractical on this road, and others say just the reverse. I would be pleased to have you set me right in this matter, either in the C. & A. Journal, or by private letter if you do not think the subject worth space in your paper.—T. P. GAY.

I feel sure a light but strong auto can traverse that sand better than a horse vehicle. It should be as light as possible in front. Try pushing a loaded wheelbarrow in sand if you wish proof of this. Just what tires should be used is a matter for experiment. I would suggest wide iron tires such as are used to fit single tube or hose pipe tires. These rims would not carry sand on their inner circumference and they would grip the sand and support the load rather than cut thru it. The wheels should be large so as to get a long support. Little wheels cut into the sand easily.—C. E. D.

A HYDRAULIC STEERING DEVICE.

I have enclosed a blue print of a hydraulic controller with description which embodies some unique and valuable features for automobile steering. I send you this for your consideration and opinion as mechanical expert with the object of having the same published in the Auto Journal. The following is a description of this Hydraulic Controller: 1st. It steers the vehicle automatically in the direction the steering handle (1) points, and locks piston automatically and positively. 2nd. Its action in steering is quick depending only on the size of ports, and the pressure maintained from the pump. 3rd. The added weight of controller and the required quantity of water would not add materially to the weight of a machine. 4th. The principle of operation is this: The steering lever (A) operates through segment of pinion (B) to rack cut in valve rod (C) thereby moving valve (D) in either direction as is desired. The piston (E) being shouldered to port rod (F) whenever through movement of the valve the ports

are opened the piston and port rod immediately follow the direction of valve movement and centering with the valve closes ports automatically, retaining water on each side of piston, hence locking piston until valve is again moved through action of steering handle. When it is desired to change the course of the machine the steering handle is pointed in the direction it is desired to travel. The corresponding movement of the valve has opened the proper port for the inlet of water to one side of the piston, and causes the piston and port rod to move in the same direction that the valve itself is moving, meanwhile the water on the opposite side of the piston has been flowing through the other port into the valve chamber within the valve, and from there out through valve rod. As soon as piston and port rod have moved to a position directly beneath the valve all ports are closed by the valve and the piston will be locked in position. A pressure gauge is placed on the dash board showing operator the pressure in air chamber at all times. This is certainly a positive steering action not complicated, and suitable for heavy touring automobiles and commercial trucks, and for other purposes.—J. W. ANDERSON.

Your hydraulic controller or steering device is ingenious and as simple as any I remember seeing for the purpose. That there is need for a power device for steering the large vehicles does not need argument. Patents have been taken out on a number of power steering devices years ago but none seem to have come into common use. The commercial vehicle itself has been surprisingly slow coming into its field, but as autos are simplified and as drivers get acquainted with them, they will do their work better and be used more widely and then devices such as yours will find a market. The weak spot of your device is the need for a pump to maintain the pressure necessary to do the work. I look to see pumps abandoned before many years as an unnecessary nuisance and gravity circulation or air cooling used instead. —C. E. D.

H. P. OF FOUR 2⅜-INCH CYLINDERS.

North Tonawanda, N. Y.

Kindly answer through the Cycle & Auto. Trade Journal.

About what Brake horse power would a 4-cylinder, 4-cycle gasoline engine give with 2⅜-inch bore and 3¼-inch stroke, at 800 revolutions, also at 1200 revolutions per minute.—ROBERT STEINHAUS.

The power any engine will give depends much on the design. Good makers have mastered the art pretty fully so one will get out of a given size about as much power as another and the output of the factory will run pretty even; but an experimenter will fall down frequently and not get the power due him. To get at the power of an engine square the bore and divide by 2.5 for 1000 ft. piston speed per minute. If the piston speed is less take a correspondingly less amount of the quotient. Then multiply by the number of cylinders of course. Your engine ought to give about 5 H. P. at the highest speed and 3½ at the other.—C. E. D.

DESIRES CARBURETOR INFORMATION.

Please answer thru your Mechanical and Technical Department where I could get valuable printed information other than given in your Trade Journal about carburetors, their construction, advantages and defects. Also please state which in your estimation are the four most used float feed carburetors and the two most used valve carburetors.—F. E. D.

Most any book on gas engines devotes a number of pages to carburetors. Hiscox on Air, Oil and Gas Engines has twenty-two pages and describes about a dozen. Price, $2.50. This Journal has more than a score of carburetor advertisers and they will gladly send catalogs on receipt of a postal card request. If you had given your address, I would gladly have sent a paper on "Carburetors and their functions" prepared by me for reading at the last August meeting of the Society of Automobile Engineers. This free on receipt of postage. It is difficult to say which carburetors are most used. Many auto makers have their own while others have a special one built for them. Probably the older forms are most used because best known. Schebler, Kingston, Buffalo, Holley and others come in this list. Of the generator valves, Lunkenheimer is probably best known because sold by an old house. Many of these are in use on launches and I have no way to get at the number. The mere fact that a large number of any device are used does not prove that device superior to a later or more costly device.—C. E. D.

SUGGESTIONS FOR CRANK CASE BREATHING.

Philadelphia, Pa.

I am very much indebted to you for your opinion on the spring piston in the April issue.

It was simply a coincidence that I should hit on the same idea at about the same time as some one else. Your suggestion of using gases in place of springs is good in that instance.

Your reply to Fred. B. Fay, of Worcester, Mass., in regard to front wheel drive is also very much to the point and I don't see why the weight is not placed where it belongs as you suggest on the drivers.

I can imagine a car designed with the engine in the rear. Take a touring car for instance; place the engine over the driving wheels. Then instead of the usual rounded hood have a flat deck over the engine embellished with a railing. On top baggage, grips, extra shoes, etc., could be carried, as there is no place now to put anything on the touring cars of the present design, except passengers. The engine would be get-at-able through panel sides, and in case of serious trouble the whole rear deck could be hinged so as to raise and leave the engine and mechanism practically bare.

I will also ask you to kindly give your opinion on the enclosed sketch to help get over the trouble of my 2-cylinder opposed engine pumping all the oil out of the crank case around the various bearings. It is due to the pressure being greater in the crank case than outside. I presume that there is some leakage past the piston rings, although the compression seems O. K. The scheme as per sketch was submitted by a friend as being a satisfactory way out of the difficulty. There has been no breathing tubes on this engine. So I tried an ordinary swinging check valve on top of the crank case, so set as to let air out of the crank case when the pistons approached each other, and when the pistons reversed there would be a partial vacuum and drain the oil into the crank case again from around the bearings, which worked well, only I lost more oil out of the check than I ever did out of the bearings.

What's the answer?

I wiped the pistons and cylinder walls dry and tried the compression and with my weight they simply acted like cushions, so there is not much leak.—SYD. VERTS.

Simultaneous work on the same problem by different men far apart and with no knowledge of each other is not uncommon. It may be that recognized need explains it or it may be that brains telepathicly influence each other. I have seen instances that seemed to indicate the latter. Your suggestion for a body has some good points in my opinion. It does two valuable things. Gets the passengers between the wheels where the easiest riding is and the weight where the driving is to be done.

The breather problem worries many people. Ordinarily they make the bearings and case tight as possible and let it go at that. If you let air into the crank case you let in dirt and this is not good for the bearings, but it is done on most 2-cycle engines and no kicking.

The carburetor plan can be worked out all right and have some advantages. You can get larger charges this way, for the pressure in the case will insure a full cylinder no matter what the speed. In fact the charge could be under several pounds pressure. You could throttle at the inlet check and so not let in much air if little power was wanted. This would not be so positive a throttle as nearer the engine but if the case was tight there would be little trouble from this source. I would use a small out check and protect it from the oil as much as possible. This will cause a little more vacuum than pressure in the case and so tend to draw in the oil. Your check was likely too big. You let out the air too freely.—C. E. D.

ADVICE ABOUT PATENTS.

Cleveland, Ohio.

I have invented a simple mechanism for producing a make-and-break spark. The arrangement is operated from a cam on the camshaft, it is controllable and has very few bearings and parts to cause trouble. An engineer and inventor told me the device was practical but said that he was not in position to say how it would be received. Do you think the device is worth a patent and if I secured a patent do you think I could get a manufacturer to use it.—A SUBSCRIBER.

The contact spark is the simplest and finest kind but it requires some designing to get it onto an engine and makers usually prefer to buy all such parts and to make as few as possible. If your device is such that it can be applied to engines easily, there is a good chance for it; but if it has to be built into the engine then it will be of use only to the maker who decides to use it. In that case, better find your user before spending much money on it. I find that there is not much danger of a device being stolen. Get it made up and show it to friends and then you will have proof that you did invent it at such a date. Drawings dated and witnessed are splendid evidence. After you have those things you need not fear losing it and can hunt for a market even before you apply for a patent. If you wish you can have a patent attorney ready to take it up as soon as there is good reason to believe that you have a market. Many inventors think the only thing necessary is to get a patent. This is the least thing of all. Get the market and patents can usually be had. Submit the device to a few practical makers and they will tell you its faults and whether it has been used before and you will learn enuf about it to be able to get a good patent. I have used make-and-break sparks for years but am now using the jump and looking toward the time when I will be in position to again sup- [illegible] contact spark.—C. E. D.

HAVE REVOLVING CYLINDER DATA.

New York.

In the current issue of the C. & A. T. J. a Mr. Webster of Sparta, Ont., seeks information about "Revolving Cylinder Motors." As we have accumulated a large amount of data, about such motors, we would like to get in communication with him, with a view to helping him along. So if you can kindly furnish us his house and street number, we would deem it a great favor. We are the successors to the Balzer Motor Co., mentioned in your reply to Mr. Webster.—REV. CYL. MOTOR CO., THOS. O'BRIEN.

We have no address other than the one given, but think you can reach Mr. Webster by using this address as given. If you have data of interest I feel sure it would interest other readers and suggest that you furnish us with a copy.—C. E. D.

HIGH WHEEL AUTO BUGGY DESIGN.

After carefully reading your valued journal for the last four or five years noting carefully what you have said in reference to air cooled, two-cycle engines and also what you have said in reference to high wheeled buggy type machines; the writer has designed the enclosed buggy type automobile.

We would thank you very much if you would criticise the enclosed blue print for us through the columns of your journal, and return blue print to us.

We would like to ask you the following questions: (1) Do you see any way that we could make this rig more simple? (2) Do you see any part of it that seems to be out of proportion or not strong enough or too strong? (3) Do you think we can get along without a differential by allowing the cables to slip a little, or would you recommend the more complicated drive of chain and differential? (4) Do you see any objection to the steering apparatus? This was adopted on account of its simplicity and cheapness. Also because you can take up lost motion. (5) What is your opinion on our friction drive scheme? (6) Do you agree with us as to the position of the brakes?

We expect to put these rigs on the market for about $400 to $450. Thanking you in advance for your criticisms, we remain.—H. A. B. CO.

Your plan in general is good. The cables will slip enough to permit getting along without a balance gear. This wears them out a little faster, but the American buyer likes new things and short life does not worry him. Low first cost is all important so leave out the balance gear. When you remember that all cars and locomotives are built with positively fastened wheels on their axles and no balance gears and found best that way you will see here is a good precedent.

The steering is not so good. The cable will give trouble if the small pulley is very small and if not the steering will be jerky. I do not think the public will long accept this form of steering. A few can be sold till they learn their defects. If you wish to use this method use a chain around a very small pulley. Your friction drive is all right except that the reverse bevel will not be needed and the small rollers will most certainly be noisy. Better leave them off and use a stiff wheel and shaft. You have room for a long hub to the wheel and it can be mounted on balls or roller bearings.

Your double gimbal joint in the steering post ought to be simplified. One is surely enough. The brakes look all right. Give them ample leverage for they will require considerable pressure—C. E. D.

CHARGING BATTERIES.

Being a subscriber of the Cycle and Automobile Trade Journal, I would ask you to kindly answer the following through the Mechanical and Technical Department. I wish to rig up to charge storage batteries. I have the dynamo. What I want to know is how to connect up same. Will I have to have an ammeter to know the rate of charging, or can I use lamps in the circuit? Please give me full directions.—J. P. WILSON.

You ought to have both volt and ammeter. It is not wise to be in the dark in these matters. Better write the makers of storage batteries for full instructions. There are many little things to be watched for and I do not feel we should use our limited space to give you full instructions. A light circuit must be of the direct current kind and you cannot get much quantity thru a single light. Several lights in multiple will keep down the voltage and increase the amperage, but you need a meter to know what you are doing. Many batteries are damaged by improper charging. Sick cells must be doctored. The quality of the liquid must be watched. This is why you had better get directions from battery makers who are usually glad to supply them.—C. E. D.

AVERAGE GEAR RATIOS.

For a 45 H. P. water cooled, shaft drive, heavy touring car having 3 forward speeds and 1 reverse, direct drive on the high with 2½ to 1 axle, what would be generally considered as standard ratio of gear reduction for the intermediate, low, and reverse.—L. V.

I do not think anyone has ever tried to compile a table of the gear ratios used. They certainly vary widely. And it is well that they should. Not only are weights and powers different but the roads and grades demand different gears in different localities. Personally I have no use for high speed and so believe in low gears. You can decide this better yourself than any one else. Intermediate, 4; low, 10 and reverse 12 will be somewhere near the average I imagine.—C. E. D.

TROUBLE PROBABLY WITH THE CARBURETOR.

Iola, Kansas.

Will you please try and enlighten me on the following questions, I am a reader of your valuable magazine, I am in trouble with my 2-cylinder opposed motor, nothing but trouble all the time. The cylinders are 5½ by 5 9-16 inch, in good shape, the inlet and exhaust valves are ground to a perfect fit, the inlet valves are automatic. The motor at times seems to develop its maximum power, but at other times it does not. At first my trouble seemed to be in the coil which was not the best in the world so I put on a new vibrating coil. The old one was non-vibrating. After putting on the new coil the trouble seemed to be in the timer which was not very good, so I put on a new one. The old timer had a single brush and a two point commutator, while the new timer has a double brush with a single pointed commutator. My battery system is exceedingly good, 7 volts, 18-25 amperes, the motor seems to start very easily. I use the very best of cylinder lubricant obtainable. The motor seems to run very good on low speed and seems to develop more power on low speed than she does on high speed, just as soon as the throttle is open motor lays down but by closing throttle quick back to slow speed point motor will strike up the old slow speed all O. K. Motor will not stand for the throttle being opened at all from setting point after this trouble commenced. I thought the trouble was in the mixture but after trying out 20 or 30 different mixtures I came to the conclusion the mixture and carburetor were all O. K. The carburetor is of the Schebler make; I also tried a spraying nozzle at end of intake pipe but without any good results at all, I am positive that the exhaust pipes are not stopped up. As to the valve timing, I think it is all O. K. The exhaust valves close a trifle past dead center and of course I need not speak about the opening and closing points of the inlets as they are automatic and actuated by the piston, the inlet valve springs are good and stiff, the former inlet spring was weak. By experience I found out the stiff inlet spring for automatic inlet valves to be the best. Where the piston is good and tight in the cylinders the motor's water jackets get good and hot just as soon as the motor has run a few minutes. This trouble at slow speed I cannot account for, as the water circulation is good, the cooling system holds 9 gallons, all the bearings on motor run perfectly cool, as to alignment of motor all is O. K. Could it be possible that there is liquid gasoline getting into the cylinders? The trouble is the most freakish I ever saw on a motor car. The cylinders have about six inches to the charge, do you think the lift too great for the size of the cylinders? The carburetor sets about 11 inches below the gasoline tank and the float in the carburetor is not large enough to stand full tank pressure from the gasoline tank without the aid of a regulating valve on gasoline line. Both cylinders fire evenly, but the explosions are very weak. At about what speed should this motor run for high speed and about what H. P. should it develop? This motor has run and run well, so why can it not be made to run well all the time or at least a part of the time under the same conditions as it did before?—A. M. K.

You seem to have tried most of the things that should be tried, so your case is a little puzzling. But I have many times put my finger on the trouble at the first jump only to be told that it could not be there for that had been tested; and relying on that assurance I have gone over the whole rig only to come back and test for myself the first point and find the trouble. I feel that your test of the carburetor was not conclusive. The engine gets too much liquid fuel. When you open the throttle some liquid waiting in the pipes is drawn into the cylinder and this is what causes the trouble. Close the carburetor until the engine will not run very well and you know you are not getting too much gasoline; then try heating the pipe near the carburetor or else heating the air and see if that does not act as a richer and better mixture should. If so it will be evidence that the gasoline does not properly vaporize. In many parts of the country the fuel is heavier than it was a few years ago and this makes it harder to get a good mixture with the carburetors then in use.

I do not understand what you mean by a regulating valve in the gasoline pipe. Surely the carburetor float is able to take care of a head of a foot or two. If not then your float is bad and it may be responsible for a flood as soon as you open the throttle. A strangle valve in the fuel pipe will certainly give trouble by not admitting fuel enuf at high speed if it is adjusted to admit the right quantity at low speed. If you have a pressure governor in the pipe you may be able to get along without a float but I do not advise anything but a good float for it is about the best thing known for the purpose to-day. The stiffness of inlet springs depends on the valve weight. Many suction valves have been so heavy that they had to have heavy springs and so have not done their duty in the best manner.—C. E. D.

PROPOSED HIGH WHEEL AUTO PLANS.

As I have been a reader of The Cycle and Automobile Trade Journal I take the liberty of asking you a few questions. I am thinking of building an automobile of the following description, and it would be a great favor to me if you will give me your opinion of such an automobile. Wheels 36 inches, 1¼-inch spokes, 1¼-inch solid tires, Timken roller bearings, front and rear axles I-beam, 4 elliptic springs, 34x1¼ inch, 5 leaves rear, 4 leaves front, angle steel frame 1½x1½x¼ in., 2 angle steel braces to connect front and rear axles. Wheel base 84 inches, tread 56 inches, seat for two passengers, also folding seat to carry more. Engine double opposed, air cooled, 12 H. P., with fan flywheel, engine in front under hood, where it can get draft of air from motion of car. Double side chain drive from countershaft, differential on countershaft, friction drive, 18-in. friction wheel on countershaft. fibre face, which slides on countershaft across the face of an 18-in. friction wheel, which is at right angle to it. Shaft from engine to 18-inch friction wheel, side lever to move wheel on counter-shaft across face of the wheel on shaft from engine, foot lever to increase friction if desired, wheel steering, weight of engine 250 lbs. Weight of automobile about 800 or 900 lbs. Throttle and spark levers on steering column. Please advise me if you think that the engine would keep cool enough to make continual runs for five or six hours, also advise me what parts I could make a change in to better the machine. I also wish to know what size sprockets to use on rear wheels and countershaft to give the car a speed of about 30 miles per hour. The countershaft will turn at same revolution as the engine on high speed.—GUY HAMILTON.

Your specifications look pretty well. It is not possible to pass a valuable judgment on specifications so limited. Your frame should have more depth, unless it is trussed. I doubt if you will be able to keep it as light as you think. I would gear it about 4 to 1. Many would say higher but more cars have been geared too high than too low. You need not fear air cooling. Well-designed air coolers are the best there are for auto work. The more I see of them the more certain I am they will be the final form. Make the friction wheels as large as you can. This saves power. The friction drive is another thing that is all right when it is built right. —C. E. D.

BUILDING SPECIAL CAR.

Union, S. C.

I am anticipating the building of a special car for my own use, please give the names of some manufacturers who build cars to order, where I can get first-class workmanship at a reasonable price.

I want to use a three-cylinder 2-cycle air cooled motor, of about 25 or 30 H. P. Would like to have your opinion as to the best motor of this kind on the market.

I am thinking of using the Manning Double Friction Transmission, Shaft Drive to rear axle, with a ratio of 4½ to one on direct, or high gear using 56-inch wheels.

Also of using the Midgley steel wheels with 3-inch Motz Solid Rubber tires, triple action springs, and aluminum coupe top.

What do you think of a car of this makeup? About what would be the cost of a car of this kind?—H. T. YATES.

The first advice to give to a man contemplating building his own car is "Don't." It costs money to build a single rig and it cannot be done as well as a regular job because all the workmen are not familiar with just what is wanted and so are likely to go wrong unless supplied with the most accurate drawings and even then they will not do the work as well as if it were a regular, for their hands get skillful by practice. If however you do not see fit to accept this pertinent suggestion, I can recommend the engine that I use in my own product which is of the type you desire and is built in Reading. I feel sure it will please you. Your wheel sizes are right and I think you will get a good car. It is better to have the work done at your own place if you are anxious to get everything as you want it. Many of the concerns who supply parts to the trade will do special jobs such as you want. The cost will depend on so many things that it is not possible to estimate unless specifications more complete are at hand. But it will cost very much more than a similar car can be bought for in the open market. We often hear how a friend bought all the parts for his car for a fraction of the price of a new car but we seldom hear about the price of assembling these parts which usually do not fit each other. It is strange that, if autos can be assembled so cheaply, every one does not build them that way and a big price reduction occur. The fact is, an auto is a complicated unit and must first exist in the mind of the designer and then be built according to his plan and experience. If it is to be better than others, it must have every little detail better, for the whole is made of details, and this explains why the best autos cannot be simply assembled from open market parts.—C. E. D.

ABOUT DRIPPING CARBURETORS.

In your February issue you kindly gave me your opinion in regard to a puzzling case of missing in my 2-cycle, 22 H. P. motor. I have found since that the trouble was in the carburetor, and wish to obtain your opinion further.

On taking off the dust pan underneath the car I discovered that whenever I stopped the motor, that there was a very noticeable leaking or dripping of gasoline from a small pin hole at the bottom of the union of the individual intake pipes leading to each cylinder. In order to make the matter clear will say that there is a pipe from the carburetor leading to a point equidistant from each cylinder, and it is at the bottom of this common union that the pin hole for the escape of excess gasoline exists. I lose so much gasoline that my mileage per gallon is actually cut down.

I sent my carburetor to the factory and they claim they put it in perfect condition, and tested it out thoroly, yet when I used it again, the leakage was as bad as before, and opening the throttle the engine missed explosions and was too slow in picking up.

My ignition, gasoline (quality), valves, compression and all other essential features being O. K. I determined to lower the float in the carburetor and now I have more power, the engine has fine pulling power on slow speeds and there is no missing. But the engine is still a little slow in picking up speed and cannot be forced to exhibit the power it had last summer, and I do not like the excessive dripping of gasoline which still takes place at each stopping of the motor.

Is the float still too high and would I do well to lower it further? It is now at least ¼-inch below the needle valve outlet into the mixing chamber. What other explanation can you offer for the excessive gasoline dripping and slowness of picking up on hard pulls and high speeds?—H. H. FRUDENFELD.

Your trouble is one common to all carburetors with few exceptions. They do not make a perfect mixture and the larger particles of the liquid drop on to the pipe walls and will run out thru any opening when the engine stops. Generally there is enuf suction when the engine is running to prevent this leak but there is a little stream of liquid when a stop is made. Lowering the float makes the engine suck harder to get its fuel and so makes a finer spray but it is not so easy to get started and will not allow charges quite so large at speed. This may account for your loss of speed but before blaming it all on the carburetor, I would look at the various bearings and see that everything ran as easy as it should. Many a time the poor engine is blamed for not doing its duty when it is working itself to death trying to wear out a dragging brake. On this account I favor controlling by engine rather than by brake and find it makes a sweeter running rig as well as a more economical one.

Put a drip cock at the hole and you will avoid loss there except when you feel that you may have an excess, as in starting, and this can be let out by opening the cock. There are some carburetors arranged to hold this excess gasoline till the next start when it serves instead of priming; but there is a chance that it will evaporate and fill the pipes full of vapor too rich to start so no method seems quite so good as fresh liquid at each start.

The old gas tank carburetors did not allow any liquid to get to the pipes and they were the most economical by far but they constantly were affected by the road surface and the temperature of the air and so had to be constantly adjusted. It seems to me that the most nearly perfect carburetor is one that has a constant gasoline level and means for varying the openings of the air and liquid passages according to the suction. By such an arrangement the amount of vacuum is practically constant and the quality of the spray is the same but the quantity varies as the needs of the engine vary.—C. E. D.

CABLE OR CHAIN FOR HIGH WHEEL AUTO.

St. Joseph, Mo.

Being a regular reader of the Cycle and Automobile Trade Journal, you would greatly oblige me by informing me on the following subjects: (1). For cable drive what do you consider the best cable? A chain wrapped with cotton belt or the wire cable sometimes used. (2). Who manufactures these cables and also Sheave wheels to be used in connection with same? A. KARRER.

I have had no experience with cable drives and so my opinion is that of an observer. I would be afraid a wire cable would not have a long life because of the small driving pulley it must run over and so would favor a chain. This if provided with fabric or leather friction surfaces ought to serve you well. Write the High Wheel Auto Parts Co. for them. They can also supply you with the sheaves.—C. E. D.

ABOUT LUBRICATING A TWO-CYLINDER OPPOSED ENGINE.

Janesville, Wis.

The automatic oiler on the opposed engine of my 1905 Yale car has given me considerable trouble, as I believe any automatic oiler will, and I would like your opinion thru the columns of the C. & A. Trade Journal as to the installation of some new system. There seems to be no place for pulley to drive a mechanical oiler.

As the engine is of moderate speed, it seems to me that a single-feed gravity oiler, feeding about 30 drops a minute into the crank chamber, with grease cups for the end bearings, should be sufficient. Such a gravity oiler could be placed in view on the dash.

Or a method that I might like better would be to have a large reservoir, and a hand pump between it and the crank chamber. A stroke of the pump every five or ten miles should give enough oil.—EARL T. BROWN.

You seem to grasp the matter fully. Many racing machines are fitted with the hand oil pump and the mechanic gives the engine a pumpful whenever he thinks it needs it. The mechanical oilers are beautiful to look at but they add so many pieces that I do not think they should be on an auto for use by the average man. My theory is that an auto should have simplicity as its main feature and that only the simplest forms will survive. Gravity oilers will do the work and splash lubrication is hard to beat; and why a more complicated system should find favor is too hard for me. In an opposed engine some provision is needed to keep more oil from being thrown into one cylinder than into the other but this can be secured by using a slotted plate which covers the open cylinder end leaving room for the connecting rod to move in the slot. The principal advantage of the mechanical oiler is that it feeds a given quantity of oil per revolution. Gravity feeds depend on the amount of time passing, while the perfect oiler would feed according to the work done. This can be secured in a two-cycle engine by mixing the oil with the fuel. —C. E. D.

(Splash lubrication is good enough but the oil level should be maintained as nearly constant as possible. Gravity feed can be made to work satisfactorily if the oil tank is near enough the engine to keep the oil fluid in all kinds of weather and overflows which determine the crank case level are used. A hand pump is all right for an emergency but should not be the only means of oiling, for if it is, the engine is sure to have either a feast or a famine.—Ed.)

ABOUT MAKING PISTON RINGS.

Can you give me a formula for turning the rings for a gas and gasoline engine and oblige.—SIDNEY TURNER, JR.

There is no specific formula for rings. Engineers differ as to how large they should be. Some make them but slightly larger than the cylinder, while others make them much larger. Some makers use steel, but others use cast iron and this is the most common material. The iron varies much and the size of the ring should be made with reference to its stiffness. If the iron is not of stiff quality it is necessary to get the proper spring by making the ring larger than if the iron is stiff. My own practice has been to make the rings about ⅛ inch larger diameter than the piston and this is a quite common practice especially where the step joint is used. If the cylinder is parallel when hot as few cylinders are, there is no need to have the ring much larger than the bore, for it will hold just as well and make less wall friction and so require less horse power. One of the secrets of getting the most out of an engine is to have little things like the fit of the rings just right. Having decided on the size of the ring and its thickness, which must be considered at the same time, turn it off center so as to thin it at the points. If it is much larger than the bore it will need to be brought quite thin at the place where it is to be cut. Next cut it either by a single diagonal cut or by milling two notches on opposite sides so their corners just meet. This kind of a cut will make a step or lap joint. The width of the notches is just enuf to make the ring a little larger than the bore when the cut is closed together. Next tie a flexible string or strap around the ring so as to hold the joint closed and inspect the shape. It will be found to have sprung unequally. Some spots will be high and others low. It is then gripped on a mandrel by its edges so as to leave the outer surface free for turning or grinding and brought to the cylinder bore size or slightly under. If exactly to size and the walls remain cooler than the ring it may expand and bind. As it wears it gets more space between the ends so it is therefore customary to start with only 1-32 or thereabouts. The outer surface will true itself to the cylinder pretty well by usage but the edges of the ring do not get this opportunity to better themselves and so should be ground. This is commonly done by placing the ring on a magnetic face plate and grinding the exposed edge. It is nearly as important to have the rings tight on their edges and faces as it is to have tight valves. The only difference is that the oil helps to pack the rings but does not help with the valves.

The practice of turning or grinding off the high spots does not seem to be just the right one, for the high spot is the place where it bends easiest and so the place that ought to be thickest. Grinding off the inside of the low spots would thin them and let them bend more easily. I have never heard of this being done however. It is quite customary to put the cut ring into a larger ring preparatory to gripping for grinding. This rather forces it to be round independently of the natural spring of the iron. Two or three settings and grindings will get it so it fits all around if a single one does not.

The surface of the ring does little packing but simply takes the wear. A wide ring will wear longer than a narrow one but two narrow ones will pack better than one wide one.—C. E. D.

WANTS SPARK PLUGS MADE.

As a subscriber to the C. & A. Trade Journal may I ask for some information? I have gotten up a spark plug which I think will prove of merit, and I desire to get the name and address of some firm that make a specialty of making the parts for plugs. I want to get a model as I am preparing to have same patented. I would prefer some firm that would build the entire plug for me. Thanking you for this information, I beg to remain.—J. W. BROWN, JR.

I do not know who might make the plugs for you. Most any shop making screws could do so. Write those of our advertisers that seem to be in this line, as given in the January Buyers' Guide number.—C. E. D.

METAL PROTECTION OVER AIR STEM OF INNER TUBE.

Custar, Ohio.

I have a question which I desire to have answered in your Journal. What is the use and benefit of the metal saddle over the air stem in an inner tube and why do they stand crooked with the tube?—H. MANNHARDT, M.D.

The usual purpose is to make sure the air tube does not blow down into the hole provided for the valve stem. This hole in the rim is often larger than it ought to be and the soft rubber stretches till it finds every possible path of escape and if a large hole is left uncovered it will extend into it till cut by the sharp edge and deflated.—C. E. D.

SMALL GASOLINE ENGINE PATTERNS.

Newark, Delaware.

In looking through several books on patternmaking, I find nothing which enlightens me on what I wish most to know of the subject. First. I wish to know how the pattern is made for a small gasoline engine cylinder, four-cycle, air cooled; overhead inlet valve, with integral head and valve chamber; cooling flanges radiating horizontally from sides of cylinder and valve chamber—vertical flanges on top radiating from spark plug hole in center of head:—in short, similar to a few such motor-cycle motors now on the market. Could the pattern for such a cylinder be moulded in a two part flask, or if not, how then? Second. In designing a crank case for four of such cylinders, I am in the dark as to the making of the pattern. On page 187 of the March issue is illustrated a crank case somewhat similar to my needs, and a sketch and explanation showing the patternmaking and moulding of such a crank case would be greatly appreciated. I am afraid that I have asked too much and that you cannot spare the space this would require, but if you cannot publish what I have asked, will you kindly inform me as to where I could obtain such knowledge.—W. V. DERBY.

Most of the light air cooled cylinders are not cast in green sand, but in sand that is baked as is common for cores. To get the sand in shape, boxes like core boxes are made, often of metal, and the various sand parts are afterward assembled to make the complete mold. The precise shape of the boxes and their number depends on the specific casting and we cannot go into details of interest only to you in this department. You will readily see that longitudinal ribs radiating from the cylinder on all sides with a different set of ribs on the head cannot be cast by using the common two part flask method. If the sand is not too thin between the ribs it is possible to lift the cylinder pattern body leaving the ribs in the sand and then pick out each rib separately. This requires the cylinder pattern to be made in halves and means for holding the ribs in place till ready to lift the half cylinder. The head is usually cast by the use of a third part to the flask or core box. The crank case is largely core work also. The concern which makes the castings can best advise how to make the patterns. You may think their way not so good as your own but if they think differently you will get better work by doing it their way for their way based on experience is probably best.—C. E. D.

MOTOR TOO SMALL AND TAPPETS NEED ADJUSTING.

I have a two-cylinder opposed horizontal water-cooled motor, 4½x4½. The valves are on the bottom of the motor; this motor loses its compression, grinding the valves puts the compression back and it is so strong, can hardly be turned over. But the compression does not last and is gone in a short time. I put in new valves and ground them and the compression was all that anyone could ask, but it would not last. You can move the end of the valve stem where the push rod strikes about one-eighth of an inch play. These valves are 7-16 in. diameter and are 8 in. long, and the car has only been used two summers (no winter driving). Do you think that there is enough lost motion in the guides to cause the loss of compression? About how many drops of Mobile A oil should be fed to these cylinders? Car weighs 1700 pounds and carries four people. I set the intake valve to open 3 inches after dead center on flywheel and close about 5 inches after dead center; exhaust opens 8 inches before and closes about 2 inches after. Don't you think that this timing should give good speed and power to the car with load of four people? Should an Autocoil made at Jersey City, N. J., give much of a spark at the points on the coil, the way this car is wired, one single coil sparking both cylinders? What speed should this car make with load? It is geared 4 to 1 on high with 30-inch tire. Thanking you very kindly for an answer thru the columns of the Journal.—A. C. K.

You do not give size of flywheel, so your measurements tell me but little. They impress me as being for speed rather than for power. I think the engine too small for the car. I have always had 3 cylinders of same size as yours in cars two-thirds as heavy. The speed it will make depends very largely on the road surface. If everything is in perfect order it ought to speed up to 1200 and turn the wheels 300 r. p. m. At this rate it would do a mile in 2 1-3 to 2½ minutes, or about 25 miles per hour. If both cylinders spark at once, the best results are not found. Use either a distributor to send the spark to the proper cylinder or use two coils. Different engines require different amounts of oil. Try it for yourself. Begin with 3 drops per minute, and watch it closely. If valves are to be durable they must seat true. If they strike on one side first, they wear or forge and soon leak. True the stems and bush the guides. Then fit carefully with about .003 inch play instead of .125 inch you now say you have.—C. E. D.

WANTS AUTO CHASSIS FOR R. R. TRUCK DUTY.

Grass Valley, Cal.

I am particularly interested in commercial cars with a view of using one or more for passenger travel on our railroad. We have a 3 ft. gauge road 23 miles in length, a 2 1-5% grade for about one-third of its length and numerous curves and would like to operate the passenger traffic with a gasoline motor train of two cars which, when loaded, will weigh about twelve tons together. the chassis to serve as the truck of one of the cars. Would you please give us information as to the most suitable equipment for this purpose such as to the size and kind of motor required and if friction, sliding gear, or planetary transmission would be the best. The friction gear, if suitable, would serve us best as we often would have to run backwards as rapidly as forwards.—JOHN GLASSON.

I would advise getting in touch with makers of heavy vehicles. They have the experience most nearly in your line. I have spent so little time on heavy work and none at all on rails so I do not feel competent to advise you. The friction drive is all right when made up properly; and with stiff shafts and anti-friction bearings to take the pressure, it is the best thing for the purpose. The commercial vehicles makers who advertise in our columns can undoubtedly serve you.—C. E. D.

IS LOOKING FOR 2-CYLINDER OPPOSED ENGINE OF 35-40 H. P.

As a last resort I have written you to ask you if you can furnish me with the name and address of some firm or person in a position to manufacture a two-cylinder opposed engine of 35 or 40 H. P. water cooled. If you know of any one manufacturing an engine of that H. P. and type will you kindly give me their address—HARRY A. CLARK.

There are more than thirty engine builders who advertise in this Journal and if you will write them you will get their catalogs and if they can not supply you they will be able to tell you who can. I am not able to give the address wanted just now altho at least two letters have been answered in these columns in the last six months pertaining to such engines. 25 to 28 H. P. however, is about as large as engines of this type are usually made. Look over the list of makers in the January Buyers' Guide.—C. E. D.

PUTTING THIN STEEL RINGS UNDER THE PISTON RINGS.

Would it improve the compression of a four-cycle gasoline engine to insert a thin sheet of metal in the grooves of the piston under the packing rings?—GEO. L. WHITAKER.

I consider it good practice to insert sheet steel as you suggest. I have frequently used clock springs for this purpose. If the ring is pinned, say one-quarter its length, from the ends, the joint in the spring can come at the pin. This gives a double ring with the joints not at the same place, and if the regular ring joint is of the lap or step variety there is no opening for the gas to go in at one side, under the lap and out at the opening on the other side. The spring also adds a little stiffness or elasticity to that of the ring and may be of value to weak rings.—C. E. D.

ORDER OF FIRING 6-CYLINDERS.

Montreal, Canada.

I will deem it a great favor if you will tell me the best correspondence school in designing gasoline engines both marine and automobile types.

Also please tell me in which order a 6-cylinder engine should fire and give me a sketch showing disposition of cranks. Which two cranks are at 0 deg. which two cranks are at 120 deg., which two cranks are at 240 deg., starting from fly-wheel end.—H. B.

I think the columns of this Journal are as good a school for engine designing as there is to be found. There have been publisht here many of the latest designs and these show all there is to be learned in this line at any school with the additional value that they are not ideal but are taken from vehicles in daily use. A technical education is of course valuable in this work but unless you can get actual experience with the engines and find for yourself their weak and good parts the technical study will likely do you little good. Next to doing the work yourself, is seeing how others do it. I do not feel like recommending any correspondence school until I know more of you. Better talk it over with any Professor or Engineer in your place who knowing you, will be able to advise better than I.

A six-cylinder motor may fire in any one of several ways. The firing will depend on how the crank shaft is made, also. The best method is to consider it as two three-cylinder engines, one having a right hand spiral shaft while the other has a left hand shaft. These shafts are so connected that the inner pistons move together, the outer ones together and the intermediates together. Now since there are six explosions in each two revolutions, we will get one each third of a revolution. They may therefore fire in 1, 3, 2, 6, 4, 5 order or 1, 3, 5, 6, 4, 2 or 1, 4, 2, 6, 3, 5 or 1, 4, 5, 6, 3, 2. A different setting of the crank shafts with respect to each other will give a different arrangement. Or if both shafts have the same spiral the firing will be different. It is a bit of easy mental exercise to follow these various settings and easily done with the aid of the sketches.—C. E. D.

2-Cycle Engines

HUGH DOLNAR

2 CYCLE ENGINE CATECHISM.

St. Alban, Vt.

Will the Journal please answer the following:

(r) A magazine description of the Premier Model 30 gives the pistons as "chilled" inside. What would be the object and what the effect?

(b) On some pistons why is the middle turned to a slightly smaller diameter?

(c) Does the snap oil ring on some pistons serve to retain the oil above it or prevent its working into the cylinder? Is it only used with splash oiling?

(d) What is the best point for cylinder oil lead with reference to piston rings, piston clear down?

(e) Mr. Dolnar replying to A. J. H. in February issue refers to "experiments by Purdy" as if the most homogeneous mixture may not be the most economical. Is this correct?

(f) Is it probable that the principle of fuel injection into compressed air is well adapted to high speed engines?

(g) Is it probable that if a portion of the charge of a 2-cycle engine escaped through the exhaust port and the exhaust was run through a surface condenser, any gasoline would be condensed with ordinary means of cooling? (For deflector experiments).

(h) How has the efficiency a tendency to differ in long and short stroke engines? The same fuel being used in each, compression carried to the practical limit which would seem to be the same, piston speeds the same, general design similar. The only difference would seem that caused by difference in radiating surface. I do not see how, as sometimes stated, compressions being equal, a long stroke lowers exhaust pressure. JAY A. CHAMBERLIN.

(a) The inside piston chilling is new to me. The effect would be to make the piston metal harder and "closer" on the outside, and as the friction of a trunk piston with a short rod is heavy, the close, hard piston might show to much advantage.

(b) Relieving any slide in the middle prevents wearing to a curve on the sliding face, and in the case of a trunk piston gives an oil and dirt chamber in the middle of the piston, which is advantageous.

(c) The bottom piston ring is placed to prevent over lubrication with splash oiling. Because the snap ring has a hole straight through it, the more rings there are on a piston the less leakage is likely.

(d) If reference is made to an oil groove around the cylinder inside, flooded with oil, this groove must of course be constantly covered by the piston, which approximately fixes the groove location, and makes one piston ring, at least, pass the oil groove.

(e) The ideal charge lights and burns quickly and completely. Hence a charge rich at the spark point and yet containing a surplus of oxygen is best. A rich charge around the spark could be fired when the same amount of fuel equally diffused through the entire charge volume could not be ignited. This was the condition produced by Purdy, at the Rambler test room, with highly favorable results.

(f) In my opinion, pump injection is the very best method of supplying liquid fuel to small internal combustion motors, because it is the only sure way to give the charge a defined quantity of fuel.

(g) As now constructed, the 2-cycle motor allows fuel to pass unburned out of the cylinder into the muffler before it can be caught by any mechanical expedient known to me. The good fuel supply is by jump, porcing the fuel into the pure air charge after the exhaust port is closed by the piston. The whole problem is extremely simple when the wholly uncertain carburetor is eliminated.

(h) With a uniform mixture of fuel and air, ordinary conditions, constant compression, length of stroke makes no difference in terminal pressure. But throttling varies compression and with high compression a small charge may be ignited, burned perfectly and expanded to below atmosphere in a small, quick gas engine.—H. D.

(In regard to question (g). It is very unlikely that sufficient gasoline vapor passes out of the exhaust to be successfully quantitatively determined by such crude means as the ordinary surface condenser. However, by subjecting the exhaust gases to an analysis, the relative amounts of unburned fuel can be determined and doubtless would, other conditions being equal, give a means of comparing one baffle plate with another.—Ed.)

Hosted by Google

ANOTHER DIFFERENTIAL PISTON IDEA.

E. Oakland, Calif.

Believing that better results can be obtained from a Gas Engine of the two-cycle type by doing away with the use of the crank case as a gas chamber, I have designed an engine to meet same, a sketch of which I herewith enclose. This piston has two different diameters giving a long length for good wearing surfaces. On the up stroke of the piston the mixture is drawn through a horizontal spring check valve into a receiving chamber which is all around the bottom half of the cylinder,

then on its down stroke these gases are compressed in the receiver until the port in the upper part of the piston is open to the cylinder or by pass port, then by-passed to the cylinder head and forced through an automatic inlet valve located in the center of the head to the combustion chamber, driving out all the burnt gases before it, then on its next up stroke the new charge is compressed and ignited.

All the valves and ports on this engine have large areas. I should be very well pleased to have your opinion on this type of Gas Engine through your columns.—R. N.

Your plan does not appeal to me for the reason that the amount of new charge is very small. The area decreases very rapidly as the diameter is lessened and so the most of the cylinder content is at the outside, but you must have quite a little room for the wrist pin and end of connecting rod and this takes away that much space for new mixture. Otherwise the device looks good but there seems to be nothing else new about it. Don't let this discourage you however. There is still much room to improve and you will strike valuable things when least expected if you keep hunting.—C. E. D.

2-CYCLE VS. 4-CYCLE?

Will you kindly inform me which will give the greatest horse power, regardless of the number of revolutions—a two-cycle engine or a four-cycle engine—both having the same piston area; also whether a two-cycle engine will give a greater efficiency than a four-cycle engine.—GEORGE C. MEYER.

The two-cycle engine will give the most power but will be less efficient. It fires twice as often as the four-cycle but it does not scavenge so fully and lets some of its fuel out thru the exhaust. For a given power it will often use 50% more fuel but for a given size it will sometimes do 50% more work. Many causes may affect either the power or the efficiency. Things such as valve timing, kind of spark, and port opening will have an appreciable effect.

This answer is general as most answers in these columns have to be. On the other hand there are those who maintain that a two-cycle can be more efficient as well as more powerful than a four-cycle. Mr. C. P. Malcolm stated in these columns a year ago, his intent to give us an article telling why this could be so but his sudden death prevented this. My own experience with two cycles for auto work, which has been more or less intermittent, has extended over about seventeen years and has finally found me converted to them as the engine of the near future for auto work. When right they show results that we characterize as "crazy" in that they develop great power and speed with very little fuel. The problem seems to be to get them so they will do this at all speeds and this seems to indicate either variable ports or valves.—C. E. D.

POINTS ABOUT 3-CYLINDER, 2-CYCLE MOTORS.

Richmond, Va.

I am planning a 3-cylinder, 2-cycle automobile engine. The cylinder is vertical—60 deg., bore 4½ inches, stroke 5 inches. I would very much appreciate your suggestions in regard to the following points:

(a) Clearance above piston in cubic inches.
(b) Shape of Baffle Plate.
(c) Size of Ports.
(d) Proper cubic contents of Crank Chamber.

I would like also for you to roughly let me know how much power this engine would be good for at a reasonable speed, say 800 to 1,000 R. P. M. Any suggestions on the method of construction would be appreciated and probably adopted.—EDWARD J. WILLIS.

As to (a), if you make your exhaust port 1 inch long you will have four inches compression, and if you compress four volumes of air into one volume of air, you have 60 lbs. pressure, temperature neglected. Somewhere from 4 to 5 volumes to one is common practice for compression.

(b) My choice is for a flat cylinder top, cut down at edges opposite the ports, cuts curved at the bottom, as this carries the coring past deflecting surface.

(c) Ports ¾ and ⅜ or 1 inch and ½ inch long, by 3¾ wide, with one bridge in the middle of each port.

(d) Give your crank box least clearance you can.

As to construction details, use 3 ring packing in one groove in piston only, and avoid fibrous packing.

You should get 15 to 18 H. P. at 1000 R. P. M.

I do not understand your "vertical" cylinders, "60 degrees."—H.D.

V TYPE OR VERTICAL CYLINDERS.

Boston, Mass.

I would like information as to a contemplated 2-cycle, 2-cylinder motor, bore and stroke to be 5½ inches each. (a) Would this motor have more perfect balance if the cylinders were set at an angle of 90 degrees. That is, a "V"-shaped motor. This practice seems to have been largely followed in the case of 2-cylinder motors in Europe, and is claimed to give very good results. (b) Also would the motor be better if I made the stroke a little longer than the bore; or the opposite—the bore longer than the stroke? The Ford runabout for instance, has the stroke shorter than the bore, the motor giving 1800 R. P. M. (c) How much flywheel would you put on, in accordance with these engine dimensions? I would be greatly indebted to you if you will publish the reply in your journal.—(No Signature.)

(a) I see no advantage in inclined cylinders, and much prefer vertical cylinders. (b) Short stroke motors respond more promptly to fuel variations than long stroke motors, and are preferred for that reason. (c) Fly wheel 60 to 100 lbs. as large diameter as you have room for.—H. D.

Hosted by Google

2-CYCLE QUESTIONS OF INTEREST.

Cleveland, O.

(a) What advantage is gained by preheating the charge after it has left the carbureter by combining the inlet and exhaust pipe? Will it add to the power of the engine? (b) What advantage has a flat piston head with a plain rib deflector plate over a piston where the head is formed to deflect the charge both in and out by means of easy curves and doing away with sharp corners where the spent gases lodge and preheat charge? (c) Can an engine with a plain deflector plate run with as high a compression as one with a deflector plate that is hollow on the inside and of equal thickness so that the piston is air cooled on the inside up to the point of the deflector plate? (d) What would be considered good economy in a two-cycle engine and a four-cycle as to the quantity of gasoline per horsepower hour for a two-cylinder auto type engine of say 20 H. P.? (e) How would you recommend keeping down the tendency to freeze in the intake header and what degree of heat would you consider the gases should have to get perfect combustion? (f) At what temperature should the air passing to a carbureter be, to use kerosene? (g) Will an engine that is satisfactory for gasoline run with kerosene? Does the compression have to be higher; if so, how much? (h) What is the advantage of feeding oil in the carbureter? Would you recommend it? (i) What is the best practice regarding the pressure in a crank case? Would you recommend a low crank case pressure and a high cylinder compression, or a relatively high crank case compression with a moderately high cylinder compression? (j) Can a two cycle engine be throttled to any extent so as to get flexibility for auto work? What ratio would you expect between high and low? (k) What H. P. can I expect out of a four-cylinder, two-cycle, three-port engine, 5x5 at 850 R. P. M. and approximately what will be the gasoline consumption per H. P. per hour I may expect with good design and proportion? What compression would you recommend?—HARRIE BERGER, M. E.

Replying to Mr. Berger, (a) I have not seen the charge heated after leaving the carbureter. The carbureter intake air is often heated by contact with the exhaust pipe which makes it pick up gasoline more readily than cold air. The charge should be delivered to the cylinder at lowest possible temperature to avoid expansion and so obtain the largest possible volume of charge in the cylinder for maximum power. Such preheating seems not likely to increase motor power.

(b) I prefer the hollow of the piston carried up into the head and the head curved down to the ports, each side the same, rather than a thin deflector either applied to, or integral with the piston.

(c) The piston walls should be as thin as is safe, and I regard the thin deflector as inferior to the raised head and sunken edge at ports. The cooler the piston head, the higher the compression can be without producing pre-ignition or self-ignition.

(d) I cannot answer this question, as all I know of my own knowledge is miles per gallon of gasoline with certain motors and cars.

(e) I am not familiar with stationary gas engine running, and never knew of any trouble from coldness of mixture after leaving the carbureter. The charge should certainly enter the cylinder at lowest possible temperature to give maximum charge bulk and cylinder cooling effect.

(f) I never knew kerosene to be used as gas engine fuel with a carbureter. The liquid kerosene is admitted directly to the intake air, or else forced into the cylinder in liquid form with a pump.

(g) Any gasoline fired motor will change to kerosene as soon as hot, with force pump or needle valve regulation of fuel at the air intake port of the cylinder. The compression can be same for the two fuels.

(h) My preference for carbureter supply would be fuel level maintenance by a pump and overflow, with return to fuel tank, so that the fuel level could not vary more than 1-32 of an inch.

(i) There is no functional relation between the crank-box pressure and the charge compression. The crank-box pressure simply places the charge in the cylinder at atmospheric pressure in two cycle work, as the exhaust port is open to atmosphere all the time the intake port is open, hence charge pressure in the cylinder cannot be above atmosphere when the piston closes the intake port, where the piston performs the intake and exhaust valve functions. Where valves other than the working piston are used, the supply cylinder can be made to force any volume of charge into the cylinder while the piston is making the compression stroke, and under these conditions the supply cylinder pressure is an important factor of maximum power production. With the ordinary two-cycle motor, where the working piston serves also as intake and exhaust valve, crank box pressure cannot possibly do more than fill the space between the exhaust port and cylinder head with the cold mixture at atmospheric pressure, because the cylinder is open to the atmosphere until the exhaust port is closed. The two-cycle motor can be, and often is, supplied with air and a combustible during the compression stroke of the piston, sometimes with pressure in the supply cylinder the same as in the cylinder compression chamber when the compression stroke ends. The more common practice is to make the charging cylinder deliver its entire charge to the working cylinder before the working piston completes its compression stroke, and in this case the pressure in the supply cylinder must, of course, be greater than that in the working cylinder so long as the supply cylinder and working cylinder are in communication with each other.

(j) The two cycle gas engine does not differ at all from the four cycle in action after charge compression begins and before the piston reaches the end of its working stroke, hence if the charges are of equal purity and combustion value, the working possibilities of the two and four-cycle are the same. The power range of a gas engine is from the smallest power, developed by firing the smallest volume of fuel up to the largest power, obtained by burning the largest charge which can be sqeezed into the compression chamber. I have seen a two cycle, crank-box supply gas engine which was strong at from 160 to 3000 R. P. M. The number of strokes to the cycle makes no difference with motor "flexibility," that is to say, range of power production, so far as one working stroke only is concerned. For the complete cycle of strokes, the cycle having the fewest strokes must give the greatest range of action, since no motor can run without energy enough stored in momentum to carry its movements through the complete cycle from the firing of one charge to the firing of the next charge afterward. Hence, in the nature of things, the two cycle must give greater flexibility than the four cycle, other things being equal. The non-flexibility of the crank-box pressure supply two cycle motor is not due to the two cycle, but to the partial supply of charge at maximum, which must, of course, limit the power range. since if the maximum charge obtainable were only enough to cause the motor to run itself, there could be no range of power shown, because charge diminution would stop the motor, while the motor which burns a large charge under high compression can show a speed range inversely proportional to the number of strokes in the cycle used. Obviously, then, the fewer the number of strokes required to complete the cycle, the greater the possible range of power, hence, other conditions being equally favorable, the two cycle motor must show the greater extreme range

Hosted by Google

of power development because its power development is the more nearly continuous, or is the least interrupted; as compared with the four cycle or six stroke cycle motor.

(k) I have seen two 2-cycle cylinders, 5x5, develop 50 H. P. without a muffler, 1200 R. P. M., and 40 H. P., same motor, with the muffler connected, the very slight back pressure of the muffler making 10 H. P. difference, maximum, because of resistance to charge entrance into the cylinder. I should say that four 5x5's, good crank-box pressure supply, could be made to show 75 H. P. with a muffler, at 1000 R. P. M. with 85 lbs. cold air compression.

Economy depends entirely on compression and the completeness of combustion. So long as any odor can be detected at the exhaust, unburned fuel is being thrown into the atmosphere.—H. D.

(In regard to query (c) it may be mentioned that during cold weather some owners wrap the intake pipe with heavy cord or lag it with pipe covering material. This prevents condensation and freezing to a certain extent. As to using kerosene in a carbureter it may be said that altho there are some on the market which are claimed to use kerosene, none of them to my knowledge make any special arrangements for its use such as pre-heating the air more than is done for gasoline, but depend solely upon vaporizing it after it has entered by means of the heat of the cylinder—ED.)

2-CYCLE ENGINE DEFLECTOR.

I, like many others am going to ask you for information, as I can't quite understand the deflector you describe in the Automobile Trade Journal of May 1st, 1907, page 86, right hand column.

You say the main part of the deflector stands about one-third of the diameter of the cylinder from the walls, the bottom of the deflector being one-sixteenth of an inch away from the walls and part of the deflector should be about one-sixteenth inch thick at the edge and thicken up rapidly to assume the form of a concave section, etc. Now I understand by that, that the deflector would be the following shape as per sketch, and will you kindly advise me by sketch just how it should be.

I would also like your advice on the following. My engine will be 2-cylinder, 2-cycle, 4x4, built up cranks of 6x1⅜, disk shaft and crank pin put on tapers and keyed on shaft which is 1½ inch in diameter, main bearings 3 inches long with white bronze bushings, crank pin is 1¼x2, connecting rods 1x1⅞, piston pin 1 inch hollow, compression space 1⅛ inch, exhaust port ¾ inch long, intake ½ inch, both clear around cylinder, 1 inch bridge between, intake from carburetor through end of crank case with disk valve as per your advice. By-pass to cylinder thru piston and a D-shaped port in the cylinder wall. Now what I want to know is what weight you think my fly wheel should be in connection with the four disks which are solid and nothing cut away only for nuts to fasten pins and shafts? Also what shape deflector is best and should I water jacket all around exhaust port or just to it. I am going to use copper water jackets and will have 1 inch space between jacket and cylinder.—H. W. KAEHLER.

The description you refer to is by Mr. Malcolm. He speaks of the deflector as if it were a piece set on top of the piston which is often true and usually true when the pattern is made. This block is 1-16 inch thick at its edge and stands 1-16 inch from the cylinder wall. Its upper surface then slopes across the piston and upwards till the main part of the

deflector is back from the wall 1-3 of the diameter. See sketch. You need not jacket lower than the exhaust port. Make your flywheel as large as possible and the weight accordingly. 50 lbs. and 14 inches diameter will serve if you cannot get larger. The crank disks are too small to help much.—C. E. D.

HAS PATENTS ON TOP EXTENSION OF PISTON.

Regarding the two-cycle engine design shown by Mr. Henderson in the May issue of the Journal would like to say that I have recently been granted a patent on this identical idea, with the exception of the oiling system. The number of this patent is 871,319.

The idea of using an extension on the piston as a valve is about eleven years old according to patent records, but none are shown having a "substantially" valveless mechanism, or which are so arranged that the pump side of the piston can have greater displacement than the working side, thus making possible complete expulsion of burnt charge.

This is accomplished by capping the piston extension which increases the area on the pump side by that amount and incidentally makes possible the "three port" arrangement. —P. R. BISSELL.

2-CYCLE ENGINE MUFFLER.

Will you tell me through the columns of the Journa how to make an efficient and cheap muffler for a 2-cycle, 7 H. P. marine engine, and oblige W. M. MILES.

Regular mufflers are supplied to the trade for as little, I believe, as $1.25 each. See our advertising columns. We cannot recommend any one particular muffler above all others.—H. D.

"The most common error on the part of amateur motorists according to Mr. Coffin of the Thomas Detroit Co., is in neglecting lubrication of small parts. Nearly every one will see that the motor is given its regular quota of oil and that the transmission and rear axle are properly filled, but the lubrication of such things as fan, front wheel, steering connection, spring link, and various lever bearings is entirely lost sight of. Manufacturers place attractive brass oil and grease cups at all important points of the car where it is practicable to do so, but in too many cases they are not used."

By plunging their hands in the dilute solution of sulphuric acid which is used in the batteries that drive motor cabs, and by rubbing that fluid upon their faces, William H. Palmer, Jr., secretary of the New York Transportation Company, and Mr. Wing, counsel for the company, disproved in the Supreme Court a few days ago the general impression that battery fluid is strong enough to burn and disfigure the human body, and on account of this somewhat spectacular demonstration the jury brought in a verdict in favor of the company.

Opinions and Suggestions

Under the above heading we will be pleased to publish letters from our readers, expressing opinions, stating how they have overcome difficulties, or making useful suggestions. In this department will also be published longer communications or articles, of either a general or technical nature. This department succeeds the "Difficulties Overcome By Users" department, owing to its growth and the varied nature of the matter received.

AN ADVOCATE OF KEROSENE BURNERS AND WATER-TUBE BOILERS.

Bantam, Conn.

There have been several articles written on kerosene burners, but none that exactly suits my case. I have a small steam runabout with Mason engine, and a car built originally by the Steamobile Co. of America, Keene, N. H. I have an Ofeldt water-tube boiler and kerosene burner. Now in justice to the makers, would say that it is the best combination that I have ever had anything to do with.

My experience has extended over the last 8 years, on gasoline burners, fire-tube boilers, and I have caulked dozens of fire-tube boilers, and had numerous "scares" with gasoline burners. Then I have had gauge glass troubles, always happening at some prominent point on the road.

While serving my apprenticeship in the assembling room, I was taught that the ball check valve was for the purpose of closing the opening, should the glass break. I was comforted somewhat by that thought on my initial trips, but, alas, the glass broke and the steam rushed out till the boiler was dry. The "expert" said that there must have been dirt on the ball check seat. There was also big chances of scorching my boiler had I been a little late in shutting off the fire.

Now for the kerosene burner and water-tube boiler. Just think, no gauge glass to bother with, what a consolation. I know I cannot burn out my boiler if my pump takes a notion to stop pumping, and I do not have to crane or stretch my neck to see if there is a little water left in the glass. I have a low water alarm that governs my supply to the boiler, and it has never failed to work in the last four years. It operates on the expansion and contraction principle, and naturally requires no attention.

It is a common thing to have air get in on the water line, and prevent the pump from sending water to the boiler. With a fire-tube boiler this is a serious affair, but with a water-tube boiler there is no danger. And the burner—well, mine has never given me the least "scare," since I had it. Suppose I do flood my burner, turning my main fire on too soon, simply burns off the surplus. Not so with gasoline, as it will find every crevice and corner and usually gets to the panels or sills or back part of the seat.

At first thought one would think that it was hard to vaporize kerosene, but this is not true with the proper fixtures. Kerosene is safer and cheaper than gasoline, and its heat is intense, so what more can you expect?

A last word as to carrying pressure on the main fuel tank. Is this not erroneous? Why should the whole fuel line be subjected to 60 pounds or so of pressure, when you consider that there are numerous connections, anyone of which are liable to spring a leak under the above pressure, especially after a short ride through our picturesque country, and more so when you consider the fact that most connections are under strains (from improper fitting), although most of us were taught never to spring a pipe into place, so as to cause a permanent strain. It is done under the illusion that the strain is temporary or just while springing the pipe in place, but how many of our assemblers ever disconnect a pipe simply to run the die up far enough to make the proper length, as long as they can start the union and make it tight? I have a tank 4 by 8 inches long under my seat and I carry all pressure there. There are few connections to keep tight at 60 pounds as I carry it close to the burner, and no valves to open or close if I want to fill my tank while the burner is going.

I carry a small hand air pump and that is all for air. With the other scheme it is necessary to have a power air pump, either steam or fitted to the head of the engine.

We have a garage connected with our works and there are some very poor and fine specimens of brain work, both among the steam and gasoline cars. Give me a steam car, water-tube boiler, kerosene burner, low water alarm, and pressure system as explained, and when you consider expense, time and that "uneasiness," I think I have the ideal.

This article was written for those that have to get the most joy for little cost and small future expense for repairs.

Yours truly,
E. J. MARTIN.

CHANGE SPEED GEARS SHOULD BE USED.

According to E. E. Coffin designer of the Detroit Thomas the general tendency of motor car design abroad is toward the smaller sized motor. While the roads of Europe are, as a general thing, much better than those in America, yet this in itself does not render possible the small sizes of motors, which are being used in fairly large cars over there. The fact that the foreign driver is much more willing to make frequent use of his gear shift, has more to do with the problem than has good roads.

In America, the demand seems to be that the relation of motor power to weight of car must be such that the machine will go romping up the steepest kind of a hill upon the high gear. As a result of this demand, American manufacturers are being forced to equip their cars with motors which cannot be operated economically upon any low or moderate road speed.

Not only is the first cost of the car increased by the necessity of building its component parts of such strength as to transmit the extreme power of the large motor, but a large power plant cannot be operated economically when 90% of its work is done at about half of its possible capacity. In other words, it is wasteful of both gasoline and lubricating oil to operate a large motor under conditions where only about half of its possible power may be utilized except at rare intervals.

Certainly, sooner or later, the American public will begin to realize, as have the foreign drivers, that it is much better to make use of the transmission which has been placed by the maker in the car for a purpose, than to demand a car with such motor equipment that it may be operated at all times without recourse to the intermediate gearing.

In an effort to meet the demand for a car which will climb any hill upon the high gear, the manufacturer is confronted by two possibilities, both equally bad. Upon the one hand he may equip the car with an abnormally large motor and upon the other he may so reduce the gearing between the engine and the rear axle that the car may perform satisfactory hill climbing feats upon the high gear.

In the first case, there will occur the greater first cost of the large motor and of the heavy driving gear rendered necessary by this large motor. To this may be added also the cost of maintenance, and the lack of efficiency under ordinary road conditions.

In the second case, where the motor of a smaller or more proper size is geared down to such an extent that any kind of hill may be climbed upon the direct gear, it is very

Hosted by Google

apparent that for ordinary driving upon the level road, and especially if this driving be at all fast, the motor will be required to have an extremely high rotative speed in relation to the number of revolutions per minute of the driving road wheels. This extremely high speed tends, of course, to shorten the life of the motor, to render adjustment of bearings and other parts more frequent, to increase lubrication trouble, and to cause an unpleasant vibration to be felt by occupants of the car.

Would it not be much better to educate the American public along the line of European practice, building the motor car with an engine of moderate size and with gearing between engine and drive wheels, which would insure to this motor a satisfactory rotative speed at the average driving speed of the ordinary operator. Such a construction would, of course, necessitate the use of the gear shift lever for hillwork, but with the modern designs of gear shift, this certainly cannot be looked upon as a serious hardship. Certain it is, that it would be far more sensible and far preferable from the manufacturers' standpoint, were this done. This, of course, to say nothing of the money saved to the operator and owner, both in first cost and in operating expenses.

Don't be afraid to make use of your gear shift lever. Have your car geared at a proper road speed; such that upon the level your motor is not racing itself to death and upon the hill do not be afraid to shift into your second or your first speed, as may be required. You will find that your machine will stand up better, and that it will be in your service every day instead of sometimes in the repair shop.

CLEANING CHAINS.

If the operators of chain driven cars will properly clean and care for the driving chains, longer life and more quiet running will result. Of course, the humane way is to provide protection for the chain by means of a case, but lacking this, cleaning is the only remedy. A chain should not be run over 2000 miles without a thoro cleaning. First wipe off the surplus dirt and thoroly clean the chain in gasoline. Then submerge it in melted mutton tallow containing a considerable quantity of graphite and allow it to boil until every joint is impregnated with this efficient lubricant. Hang it up to drain, then wipe off the surplus, as this simply collects dirt. Replace it on the car and the results are surprising.

RECIPE FOR MUFFLER PAINT.

The following recipe for paint for mufflers is given by George Jackson Scott, New York agent for the Jackson, and is said to have proved most satisfactory. The quantities given will make about 2¼ lbs of paint, which is quite sufficient to give the average sized muffler and exposed lengths of exhaust pipe two coats of paint. Boiled linseed oil, 1-5 lb.; Japan varnish, 1-5 lb.; spirits of turpentine, 2-5 lb.; lamp black, 1½ oz.; pure powdered graphite, 1½ oz.; powdered oxide of manganese, ⅜ oz. First mix the linseed oil and the Japan varnish well together, then add in the order named, and stirring all the time, the lamp black, the graphite and the powdered manganese. The solids should be added slowly, and the stirring briskly maintained. As the mixture thickens thin it down with the turps, until the quantity mentioned is added. The paint should be used at once, for it dries rapidly, and every time the brush is dipped the mixture should be carefully stirred. It is well to paint the muffler while it is hot, first cleaning it thoroly.

CLEANING LEATHER UPHOLSTERY.

There are many preparations on the market for cleaning and polishing leather but a homemade compound can be prepared by owners, and will be found very effective and can be used on light colored leather with good results. To a pint of boiled milk which has been allowed to cool add a drachm each of sulphuric and hydrochloric acid and after thoroly mixing them add half a drachm of oil of lavender, a pint of vinegar and the white of an egg beaten to a froth. This mixture will remove stains and is applied in the usual manner with a soft cloth and then rubbed with a dry cloth.

As a rule, cars are fitted with smaller tires than they should be, because the smaller sizes cost less. With the tires that are proper to it, in both size and quality, a car will need less repairing, the tires will wear longer and the passengers will ride in greater comfort.

Those who have their own garages might profit by the arrangement used by a dealer, of not only having pits in the floor for inspection of the under side of the car, but also a depression in which a shallow trough of water is kept for testing tires. A neat cover can be fitted with ring or flush handle so the pit is not objectionable when not in use, but is extremely handy when wanted.

In addition to the numerous methods of repairing cracked cylinders may be added that of using a mixture of about equal parts by weight of fine iron filings, sulphur and salammoniac made with water into a stiff paste about the consistency of putty. Fill the chiseled or drilled out groove along the crack and allow the combination to harden.

Owners of foreign machines should watch carefully the kind of repairs made by local garages and repair men as there is a great temptation when a nut with metric thread is missing, to slip on an ordinary standard nut of similar size. These will bind on the thread and hold after a fashion as the threads are so nearly alike, but the practice is very injurious to the bolt and should never be allowed except in cases of absolute necessity. Small diameter nuts conform more closely to metric sizes than large ones and unless cautioned, repair men will occasionally use them when procuring a metric threaded nut might entail some search or delay.

The Eureka Vehicle Co. of Rock Falls, Illinois, well-known maker of buggies and other light horse-drawn vehicles, is now building tops for automobile manufacturers, all its work in this line being done to customers' specifications. Unusual facilities enable the company to promptly meet the requirements of those who want tops in large quantities and duplicates in quantities of any style of top submitted can be made.

Pennsylvania Black Filler & Paint Co. of Williamsport, Penna., manufacture a black filler which is largely used as rough stuff on automobile bodies and parts and is said to produce a fine, hard and smooth surface as it rubs freely and does not crack or peel. It is also used as an iron filler in giving a finish to machinery of various kinds. It is air floated which insures uniformity of texture and is graded to suit different requirements.

Our Quick Detachable Terminal can be applied to the spark plug cable instantly without tools. It makes a perfect contact, cannot jar off, but allows quick disconnection when desired.

DID YOU EVER

observe how a "fresh" battery speeds up your motor? Experienced motorists have noted this. 'Tis the hotter spark that does the trick. If increasing the heat of the spark will so greatly **increase** the power you can readily appreciate how much **more power** you can get from the **Cleveland Spark Plug** that not only sparks but **"shoots a FLAME"** right into the mixture, causing **instant detonation of the entire charge,** giving **magneto effects** with ordinary batteries and still more powerful results with magnetos. The action of the spiral core makes this the only plug **really** proof against short circuiting, since it **positively** prevents the deposit of carbon on the insulation surface.

"It shoots a flame."

Our printed matter contains interesting information on ignition and explains in detail the wonderful action of the "spiral core."

FREE Write for it TO-DAY and ask for our introductory offer (for a limited time) which gives you FREE with each order for spark plugs, your choice of Battery Connectors or Cable Terminals.

Trade Printed Matter

Munn & Co., of 361 Broadway, New York City, pub- "Manufacturer's Index" which is a directory of concerns who have recently advertised in the "Scientific American." Several manufacturers in the automobile field are included in the list, which is classified according to the products of the makers.

The latest number of the "Rambler Magazine," published in the interest of Rambler motor cars by the makers, Thomas B. Jeffery & Co., Kenosha, Wis., is a Physician's Number, containing accounts of the experiences of a large number of physicians who are using Rambler cars. This number contains 32 pages and cover, and besides the physicians' experience data, contains a large amount of other interesting matter.

The E. R. Thomas Detroit Co., is now publishing a house organ called, "Thomas Detroit Doings," containing information regarding recent performances of Thomas Detroit cars, testimonials from users and other data that serve to impress the reader with the excellence of this make of car.

A very attractive folder has been issued by the Keystone Lubricating Co., Philadelphia, Pa., bringing out the good features of Keystone Grease a mineral lubricant for automobile use. The illustrations are unique and effective and the descriptive matter is presented in terse style.

A new edition of Dyke's "Anatomy of the Automobile," published by A. L. Dyke, of St. Louis, Mo., has appeared. It consists of 725 pages of matter obtained largely from the instruction books of motor car manufacturers and is apparently intended as a guide to operators of cars of all makes. It is bound in a substantial cloth cover. A number of 1907 instructions are included for the convenience of those purchasing cars of that year. Price is $2.

W. S. Sheppard, 21 Lawrence street, Newark, N. J., has lately issued a 16 page booklet dealing with the subject of lubrication and containing, in addition to advertising matter, relative to "Ideal" oils and other products which he makes, some general information regarding the subject of lubrication and the history of the production of lubricants. Mention is also given of a preparation made by Mr. Sheppard for mixing with the water used in the cooling system of gasoline cars.

The latest catalogue issued by the Boston Gear Works, of Norfolk Downs, Mass., is a compact booklet 3½x6 inches and containing 88 pages and cover. This booklet has a very practicable feature in an index on the first inside cover page, the placing of the index on this page being a feature which could be well copied by catalogue compilers, giving, as it does, to the reader a key to the contents of the book as soon as it is opened. This catalogue is known as "Catalogue EI" and very thoroughly covers the subject of gears, chains, sprockets, bearings, steering devices, and other products of the company. They have also issued a special circular on their steel miter and bevel gears with generated teeth. This circular is known as D-I.

A very handsome catalogue has been issued by the Stewart & Clark Mfg. Co., describing and illustrating their 1908 Stewart Speedometer. The decoration of the pages is very attractively done, and in addition to the decorative illustrations, a number of half tone cuts are used to illustrate the device itself, factory and branches of the manufacturers, attractive road scenes, and interior views of the factory showing the processes through which the device passes in its manufacture. One of the most practical features of the catalogue is the use of interior illustrations plainly showing the constructive features of the device. A few of the back pages of the book are devoted to testimonials from users of Stewart instruments. This is probably the largest catalogue ever issued in the interests of a Speedometer, consisting of 56 pages containing a very large amount of descriptive matter, claims of excellence, etc.

Number 8 of the "Reo Echo," which appeared during the last month, is a particularly interesting issue. The "Reo Echo" is a house organ published by R. M. Owen & Co., in the interest of Reo Cars. Among the attractive features of the latest number is an article by Alfred Reeves on the "Motor Car of 1908." Another important article deals with the "Planetary Transmission" by H. T. Thomas, and the editor of the "Echo" has written an article on "Christening a Motor Car," which is quite interesting. Although containing a large amount of matter designed to create interest in the Reo car, the "Echo" contains a good deal of general information, news matter, etc., of interest to any reader.

The Ford Motor Co., of Detroit, Mich., are now publishing a house organ called the "Ford Times," in which is presented to the motoring public plenty of information calculated to cause the reader to desire a Ford car. This publication contains considerable matter of practical value to dealers, such as advice in regard to advertising matter, reproductions of advertisements used by Ford agents, information regarding the methods used in successfully pushing Ford cars, etc.

The Auto Vehicle Co., of Los Angeles, Cal., has published a compilation of the results of 50 races in which is shown that "Tourist" cars made by this concern have won 44 out of 50 events in which they were entered, in every instance the winning car being equipped with Goodyear Detachable Tires and Universal Rims made by the Goodyear Tire & Rubber Co., of Akron, Ohio.

The Firestone Tire & Rubber Co., of Akron, Ohio, recently sent out a legal looking document entitled: "Firestone License," containing 6 paragraphs embodying directions for the proper use and care of tires, which, if followed by users, will result in economy and long service. This "License" is provided with a very legal looking seal in the lower right corner, the design of which comprises a conventionalized motor car wheel across which the well known emblem of the company, a stone with the word "Firestone" on it, is placed in the form of a sticker which is placed over a ribbon interposed between the sheet containing the license and the "Firestone" sticker.

The Reading Standard Co., of Reading, Pa., have just issued a new descriptive catalogue relative to their line of pedal cycles. It contains 24 pages and cover of handy size for carrying in the pocket, and gives specifications and other information relative to a fine line of Reading Standard bicycles, a line including men's roadsters and racers as well as ladies' and juvenile wheels. In addition to the complete bicycle illustrations a number of illustrations of various types of handle bars are given; also line cuts illustrating the Reading Standard Seat-Post Pinch Binder and the Reading one-piece hanger, which are important features of this line. One page is devoted to illustrations of three models of R S Motorcycles made by the same company. This company has also issued a special motorcycle catalogue, consisting of 16 pages and cover, measuring 8x10½ inches. The cover is in gray with the lettering and decoration in black and slate color, making a very dignified and attractive cover design. The illustrations in the catalogue show different views of the motor and other important features of the R. S. machines, such as the R S spring fork construction, oiling devices, etc. Complete specifications and illustrations of each model are given in the rear of the book following a general description of the construction and special features. A cut of the factory is shown on the page following the title page; and an introduction in the form of a salutation on pages 3 and 4, gives some information regarding the ability of the Company to produce first class machines, the facilities at their disposal, etc. The last two pages of the catalogue are taken up with illustrations of the R S tandem attachment, spark plugs, and other accessories furnished with these machines.

THE RED BOOK, FOURTH EDITION.

F. S. Blanchard & Co., of Worcester, Mass., have just published the fourth edition of the "Red Book" an Interstate Automobile Guide containing detailed descriptions of the best routes between the leading centers and coast and mountain resorts of New England, also a gazetteer of cities, towns and villages, street maps of principal cities and towns, and a diagrammatical map of the entire district covered. This new edition has been practically rewritten and is in effect a new book. A number of improvements have been made in the arrangements of the data given, several more routes are described and changes made to render the contents of the book more lucid and more easily accessible. This book contains upwards of 600 pages and a very valuable feature of the same is the system of indexing and cross-references to enable the user to find any particular information without delay. The index to touring routes for example, occupies about a dozen pages, the gazetteer of cities, towns and villages containing detail information regarding post offices, telegraph offices, stations, etc., includes over fifty pages, and beside the name of each city, town and village is given reference to the map containing the same, and the numbers of the routes on which the town lies. One of the important changes made, is the use of the words right or left in place of North, South, East or West, in giving the directions for turns, etc., this method being simpler and much more easily followed.

A diagrammatical map of New England, which accompanies the "Red Book" is in a separate, durable folder, and not bound in the book. Folded up it measures 4½x9 inches and therefore fits the coat pocket.

574 routes covering 26,000 miles of roadway are described in detail with running directions, distances, conditions of roads, danger points, grades, etc., given 69 street maps show how to get in and out of congested districts in the cities, and a selected list of the best hotels and garages is given in connection with each route so that the tourist in looking up any particular route has all the information regarding that route at hand instead of having to turn back and forth to different parts of the book. The price, $2.50, covers the cost of delivery to the purchaser.

The same publishers have also compiled and have now on press a series of Pilot Sectional Road Maps.

VOLTA MAGNETO

A High Tension Magneto, better mechanically, better in design and simpler in construction than any other magneto on the market.

¶ There is no possible chance nor opportunity for ignition troubles with the Volta. Possesses exclusive features in design, fewer parts, no complicated adjustments, and is as effective in the hands of a novice as in the hands of an expert.

¶ No coil, battery or timer is necessary. The Volta is a **Complete Ignition System** and generates an inexhaustible supply of current synchronously distributed at the moment of greatest power. It will ignite a poorer mixture than the ordinary magneto.

¶ Simplicity and strength, excellence in material and workmanship, is the keynote of its construction. It excels every other magneto on the market.

¶ The Volta is mounted on imported ball bearings throughout.

¶ The Volta Magneto is guaranteed for one year against defects in material or construction.

Witherbee Battery

is the one perfect ignition system. The consistent relia performance of the Witherbee has so standardized this proc that it is included as part equipment on the greater majority motor cars.

Wico Spark Plug

is guaranteed against imperfections in material, workmanship, porcelain bre age by heat. It excels every other plug on the market because it is better design—because it possesses the exclusive micrometer adjustment feature wh permits the setting of the spark gap to 1-1000 of an inch—to a KNOW DISTANCE. No guess work—no worry—no trouble of any kind if use the WICO.

The Wico Ring an Roller Timer

more simple, accessible, compact and durable than other Timer. The Ring MAKES DIRECT CU RENT between the two contact points, bridging a ga about a quarter of an inch—reduces resistance to a m mum. Prevents unnecessary wear on the bearings, cau by current passing through them. The ring recei all electrical action. When worn, the Ring can be ea removed by lifting out with the fingers, and can be si larly replaced, practically making a new Timer.

lical and all but detail refinements, the vice has not previously been given more n brief mention in these columns; hence now publish a detailed description with ference to the accompanying lettered tional illustration so that our readers y be thoroly conversant with the conuctive features of this now widely known rburetor, the product of the F. E. Bow- Co. of New Haven, Conn. This carburr functions automatically, correctly reguing the density of the mixture for differ- motor speeds. It is of the float feed e and has one main and two supplentary air inlets. The air from all inlets drawn directly thru the gasoline spray that the gas is completely formed before ving the mixing chamber.

Sectional View 1908 "Bowers" Carburetor.

Referring to the sectional drawing, A ws spray nozzle concentric with reser- r B, assuring no change of level in noz- when on grades. C shows center tube. erted in this tube is a truncated cone pen at the bottom to a diameter of two hes and extending to the top of the spray zle. This cone admits the main supply air. E shows an upper conical shell two hes in diameter at its upper end, reicted at its lower end to a diameter table for the size of the motor, and ving a flanged collar extending below, ich extends over the lower cone leaving annular space all around between the cones; this space varying in size acding to the size of the upper cone inted. F is an annular float controlling gasoline inlet by means of a trip G.

Tube C, after cones are inserted, for an annular vacuum chamber of consid able size.

In operation, air first enters thru the b of the lower cone, in a large volume. is restricted thru the small upper passa attaining great velocity around the sp nozzle, causing the gasoline to spray fr the nozzle and producing a dense va suitable for starting. As the speed of motor increases, a strong vacuum is ated in chamber C, which acts on supplementary air valves, causing them open and admit air. This air rushes o the outer walls of cone D, meeting at top the rich vapor issuing thru summit cone D. Owing to shape of the passa caused by the flanged collar of cone E, the outer walls of cone D, thru which passes, this air breaks thru the center or with a whirlwind effect, breaking up gasoline into minute molecules, each panding into the gradually increased sp of the upper cone, a complete mixture the finest possible consistency ready be measured off to engine by throttle va K.

Keystone Grease

Keystone Lubricating Co., 20th street a Allegheny avenue, Philadelphia, puts a lubricant called "Keystone Grease" whi is said to be a pure petroleum product c taining absolutely no talc, asbestos, res resinous oil, beeswax or any other adult ant to obtain artificial body. It is claim that "Keystone" grease will not char in consistency and therefore cannot fl too freely from the cups. As there are vegetable oils or animal fats in Keysto grease it cannot become rancid or devel fatty acids that would attack the metal the bearings.

For grease cups on automobiles t maker recommends No. 1 density which solid and is used in compression cups. F gear cases and for splash lubrication in t crank case, No. 3 is recommended, t being a semi-liquid that remains at t same consistency regardless of tempe ture changes same as the No. 3 densi It will not thin out and leak thru the c ing. This company maintains warehous in several large cities and sells its produ under a strong guarantee. We are advis that every bearing shipped by the Standa Roller Bearing Company of Philadelp is packed with Keystone Grease.

ll known series of burners two modifi-
ions adapted to motor car lamps burn-
gas.

s supplied either burner can be connect-
to the batteries of the ignition system
a touch of the finger does the lighting.
e "Gem" hand lighter can be attached
any of the different forms of the acety-
e gas burners. The mere pressure of
finger on a lever throws a spark in the
h of the gas which ignites instantly.
ile the "Gem" is somewhat less conven-
t than the "Jewel" automatic burner,
"Gem" is perfectly practicable and
able.

e "Jewel" Automatic Gas Lamp lighter. The "Gem" Hand lighter.

Where the engine is ignited by a make
brake system with spark coil, an ad-
onal wire is run from the coil to the
ners. Where a jump-spark coil is
d an extra spark coil which occupies
same space as a dry battery must be
erted in the circuit between the batter-
and the burners. Only one spark coil
be needed in any case, whether one
nore "Gem" lighters are employed.

he "Jewel" Automatic lighter requires
rely the pressure of a push button
ed on the dash board to instantly light
acetylene lamps. No spark coil is
d in this style. One lamp or more may
ighted at the same time from the same
ton. The "Jewel" burner is adapted
n the "Advance" automatic acetylene
ner, thousands of which are in use
esidences, in all parts of the country.

Palmer-Singer Town and Country Car 28-30 H. P. $3,000

Palmer-Singer Six-Fifty Racing Car 6 Cylinders 50 H. P. $2,450

Palmer-Singer Four-Forty Seven Passenger Touring Car 40 H. P. $4,000

Palmer-Singer Skimabout, 28-30 H. P., **$1,950**

The Palmer-Singer Skimabout is on Exhibition in Our Salesrooms. It is the Motor Car Sensation of the Year

The "Skimabout" is a town runabout that will make forty-five miles an hour over country roads, climb any climbable hill, outrun and outwear most runabouts and still give a town and traffic service that none of them can give. It is the trimmest, most stylish and most attractive medium-power runabout on the market; for the man who has little chance to go touring far afield it fills a long-felt need.

Nickel steel throughout. Imported F. & S. ball bearings exclusively. Bosch high tension magnetos and multiple disk clutches in all models. Nickel steel, double and single drop frames. Drop forged I-beam, nickel steel front axle four-speed selective type, sliding gear transmissions with direct drive on third speed. All brakes equalized, all expanding type and on rear wheels. Universal joints on all steering connections. All types shaft-driven, all moving parts inclosed in dust-proof cases.

gniter Co., is the inventor of the "Radio" orage ignition battery, here illustrated, product of "Radio" Battery Co., 433 W. 3d street, New York City with which Mr. Vitherbee is now associated. This latest roduct of the genius of Mr. Witherbee already meeting with favor and we are lvised that the "Radio" Company equipp- l the U. S. Warship fleet now making a orld tour with batteries for the wireless legraph system and that the Italian avy is also using the same make of bat- ry for this purpose. The manufacture "Radio" batteries is under the direct pervision of Mr. Witherbee.

Having found by ten years experience storage battery manufacture that the ief source of trouble is the construction the plates and the successful retention the acid in the retaining jar, Mr. With-

The "Radio" Storage Ignition Battery.

bee has kept these features in mind in signing the "Radio" battery and endea- red to guard against any trouble from ese sources.

The plates are of the Faure or pasted pe and are made with great care of the rest materials obtainable. The maker's ject is to obtain the highest possible pacity and longest life without sacri- ing mechanical strength and it claims at these plates, if given proper care, ll last from three to four years with- t renewing and even then the expense small.

The cover clamps are made of enam Bessemer steel, correctly formed to fa the cover to the jar and also secure handle. They are non-corrosive.

The handle is also made of enam Bessemer steel and provided with a rubber grip. It can be folded down, removed if desired.

Wiring clips made of rolled copper which to fasten to the ends of the vice wires, are furnished with each bat and are made to fit the positive and negative terminal screws respectively owing to the difference in diameters the holes in the clips it is impossibl make a wrong connection.

The construction, it will be noted very simple and secure, consisting flanged compartment jar, a cover, and elastic washer interposed between the and the cover. The washer is first mented to the jar and is then compres and a special clamp is placed around flanged edge of the jar and over the rib edge of the cover. The pressure is t released and the clamps are securely in place by the pressure of the ela washer, thereby producing an acid t battery case without the use of screw exposed metal parts.

The containing jar is of the flan compartment type, made from a new e trical insulating, acid proof, vegetable c pound. It is formed in one piece and vided by a new method into separate which are insulated from each ot thereby preventing internal leakage, wl is the cause of a cell losing its volt by internal discharging. The jar is vided with a soft rubber cushion or s which protects the bottom and lower s of the jar from sudden shocks, thus el nating any liability of breakage.

The cover is composed of the same terial as the jar, made in one piece the terminal bases and vent tube, an provided with a special ribbed edge. polarity of each terminal is pl ly embossed on the cover so that th can be no mistaking of the negative f the positive. The washers are made f pure Para gum which is impervious to acid and hermetically seals the c forming acid tight joints around the te nals and top edges of the jar.

Gas ventilating caps screw into the tubes. They are made acid tight with vent tubes by aid of a soft rubber was and contain a ball valve which allows escape of the gas after it has attai

STRENGTH

is a feature of the 1908 Rushmo
Lights. From the first, we ha
used sheet brass and copper abo
one-third heavier in gauge than
found in competing lamps. T
spin the back cap and front do
in such heavy material has requir
several annealings. These anne
ngs left the center of the back cap soft.

We now stamp and draw these parts in powerf
presses. The drawing operation itself stiffens t
metal, and the back cap, heretofore soft in the cent
s now struck out in two operations without annealin
t is approximately twice as stiff as it was, and twi
as effective a protection for the lens mirror.

The Rushmore is the only automobile gas lamp
which the parts above named are press-formed. A
others are spun—from much thinner stock—and a
subject to all the defects inseparable from that pro
ess. We mention these facts to show how far t

Tenth.—Control

No. 56 "Acme" Automatic Multiple Spindle Screw Machine with motor drive.

ate of efficiency and usefulness. The anufacturer has recently improved the o. 56 Acme, here illustrated, so that the ngle belt drive can be readily converted to motor drive by substituting gear (H) r the pulley and placing a motor platform d motor as shown in the end view hereth.

The advantages afforded by the single lt drive and the relative changes are: rst.—That they make the relation beeen the cam shaft and the spindle drive aft always positive; eliminating accints to tools due to belt slippage. Secd.—Belting troubles are reduced to a inimum on the single belt drive and enely eliminated on the motor drive. hird.—The countershaft is simplified or minated. Fourth.—The output of the achine is increased because the positive ntrol of the change of speed for the tools

hand and power movements of the c shaft mechanism as well as the flow oil is brought within easy reach of the erator while in a position to observe action of the tools.

The company is in a position to sup No. 56, (2¼-inch), machines equipped single belt drive or for motor drive, w or without motor. Any standard mo can be used without the slightest alte tion in the motor.

The size of the motor required, var from 3 to 5 H. P., depending upon class of work for which the machine is be used.

1AMARONECK AVE.
AND POST ROAD
WHITE PLAINS, N.Y.

Isotta Fraschini Headquarters,
BRIARCLIFF TROPHY RACE.

New York, April 27, 1908

Hartford Suspension Co.,
67 Vestry St.,
New York City.

Gentlemen:-

It will probably be of interest to you to hear of the perfect success of your Shock Absorbers with which my Isotta was equipped.

At Savannah these Shock Absorbers were of material benefit to me when driving at very high speed.

In the Briarcliff Race I very much doubt the possibility of my being able to make the speed that I did over the very rough road if my car hadn't been provided with Hartfords.

I understand that the Thomas car that I am to handle in the Grand Prix is already equipped with Hartfords, as they are regular stock equipment on all Thomas cars.

Hoping that your Hartford Shock Absorbers will always meet with what they deserve, I am,

Yours very truly,

Lewis Strang

HARTFORD
ABSORBER
New York to Paris Race

Remarkable demonstration of the perfection and durability and the increased comfort resulting from the use of Truffault-Hartford Shock Absorbers.

Write for our "Ruff Road" booklet, Dept D, or a demonstration will convince you

New York City, N.Y., April 6th, 1908.

The Hartford Suspension Co.,
67 Vesty St.,
New York City.

Gentlemen:

It affords me pleasure and I think it is only right to advise you of the remarkable results obtained from the use of the Truffault-Hartford Shock Absorbers on the Thomas Flyer, "America's Champion" in the New York to Paris race, which I drove from New York to Cheyenne, Wyo. In addition to having the right car, I feel that your Shock Absorbers contributed largely to our success in the race so far.

In spite of the fact that we encountered every kind of road imaginable and had to go through snow drifts, slush and water, heavy mud which was sometimes frozen in hard furrows, and over railroad ties for many miles in places where the roads were practically obliterated, we lead all of our competitors across the continent and reached Cheyenne on March 9th, 516 miles in advance of the nearest competing car, without breaking or ever straining the springs and the added comfort for the occupants of the car en route was considerable. The car has since reached San Francisco March 24th with a load of 1206 miles.

Wishing you all kinds of success, I am

Yours truly,

Montague Roberts.

immense line manufactured or market by The Auto Supply Co. of 1733-17 Broadway, N. Y.

The combined measure and funnel h been designed, as is obvious, for the pu pose of combining the functions of bo measure and funnel and for the great convenience obtained by using one devi instead of two in filling tanks, cra cases, oilers, oil cans, etc. It is made both tin and copper. The tin measur list at from 20 cents for the ½-pint si to $1 for the gallon size. The prices the copper measures range from 65 ce to $3.

"The Funnel-Measure" and the R. I. V. Radi Bearing.

The main feature of the R. I. V. annul ball bearing, which is imported by T Auto Supply Co., is the method employ to separate the balls. It has been t purpose of the designer to provide a se arator that would not break or beco distorted. The R. I. V. bearing is ma with an anti-friction ring cast around t balls after they are placed in proper po tion and the balls are then loosened by special process so that they will revol freely. This ring, besides acting as spacer, aids in the lubrication of the be ing and is indestructible under all possib conditions. The main rings of this be ing are made of a high grade steel that hard and tough and the balls are of hi carbon crucible steel, are hardened a accurately finished.

It is understood that the Acme Mot Car Company, of Reading, will build a s cial car for the Vanderbilt race and w not put in one of the stock of sextuple

Safeguarding the Garage Against Fire

(Continued from May)

STORAGE OF VOLATILE OILS.

"All gasolene and similar volatile oils should be stored in good heavy tanks sunk under the ground as far from the garage as practicable; tanks to be of ⅜-inch boiler iron tested to 100 pounds per square inch and coated on the outside with tar; all connections for filling and pumping to be made in top of tank, and the tanks to be encased in a concrete covering on all sides and over the top at least 12 inches thick to prevent as far as possible leakage and consequent filtering of the oil through the ground into cellars. Where it is necessary to place the tank under ground in close proximity to a building under which there is a cellar or basement, the top of tank should be sunk below the level of such cellar or basement so as to eliminate the danger of drainage from a possible leak. Pressure systems and gravity flow of volatile oils are both to be condemned, as the presence of oil in pipes inside of building is not good practice and in case of a leaky pipe or valve, oil may find its way into the building. In cases where there is no yard room for the storage of gasoline, it may be stored under the sidewalk, subject of course, to the local rules of the city and in accordance with the general condition suggested.

"The best method for handling oil from tanks is by an approved pumping system and whenever the physical conditions will warrant it the pump should be placed in a fire-proof building outside of the main structure and not communicating therewith. If, however, it is absolutely necessary to place the pump inside the building a fire-proof room or closet should be constructed securely cut off from the garage and ventilated by a brick flue extending at least six feet above the roof of the main building, said flue to have metal double gooseneck cap so arranged that openings in same shall be at least 10 feet from any exposed windows. This flue to be built from floor and to have openings at floor and ceiling inside of pump room not less than 6 x 6 inches; all openings in flue and gooseneck to be protected by fine brass wire screen.

"Storage tanks for volatile oil should be filled from the outside of the building and pipes for filling same should not pass through any portion of the garage.

"Tanks of machines should not be filled inside of the building, but should it be imperative to so fill them, a filling station should be constructed about 20 feet from the entrance of the garage; the station to be of fire-proof construction and cut off from balance of building, and all machines to be brought to this point for filling. If this arrangement is not practical, a portable metal tank, mounted on wheels, of about ½ barrel capacity, filled from main supply tank outside of building and having a screw cover over filling opening may be provided for the gasolene. This tank should have a registering pump attachment with tube to fill automobile tanks. If it should be considered impracticable owing to small size of garage or because of other features to use the above described portable tank a five-gallon safety can may be substituted but it is not good practice to use them. Whatever may be the means of filling auto tanks neither cans nor portable tanks should be allowed in the garage when not in actual use but should be stored outside of the building.

"As to general conditions in the building, care should be exercised in the matter of storage of calcium carbide and comprest gas tanks; the former should be stored strictly in accordance with rules of the National Fire Protection Association, and the latter should be so stored as to obviate the possibility of being exposed to high temperature in case of a fire; that is they should never be stored inside the building as the sudden expansion of the gas consequent to a rise of temperature in case of fire, may cause a disastrous explosion. A strict prohibition against smoking inside the garage should be enforced and as far as possible the carrying or use of matches in the building should be strictly ruled against. Floors should be kept swabbed clean of all accumulation of oils or gasolene and the proper disposal of oily waste insisted upon. All unnecessary assembling of individuals in or about the garage should be discouraged and only those employed about the building or owning machines in same should be permitted inside.

"An abundant supply of sand pails should be provided in all rooms where

Hosted by Google

gasolene is stored or used. In other parts of the garage water pails present the best means of controlling a fire. There have been cases where comprest air has been very successfully used to blow out a fire ignited by a sparking motor. Automatic sprinklers have also been very successful in not only holding a fire in check but in completely extinguishing it even when large quantities of gasolene were exposed in open receptacles within a few feet of the blaze."

Thoro Methods in a Retail Business

The Auto Trading & Repair Co., 2167-2169 East Ninth street, Cleveland, Ohio, have built up a very progressive retail business, handling both new and second-hand cars, and their success has been obtained by careful attention to customers' wants and a constant endeavor to give satisfactory and efficient service in each case, whether the customer desires to sell the car thru them, purchase a new or second-hand car, or is having repairing done. They make a special feature of an individual department service in the sale of used cars. A purchaser is given the privilege of leaving his machine for 30 days with them without charge, and they advertise and demonstrate it at no cost to the owner, following up carefully all inquiries. The owner names the price he desires to obtain for the car and the Auto Trade & Repair Company add to this price a proper sum to cover their commission and the expenses of the sale. This company also offers to purchase cars for persons who desire to obtain good second-hand machines. Their method is to obtain from the intending purchaser information regarding the make or type of the car he desires, and to endeavor to obtain such a car at the price he desires to pay. Being in close touch with the owners of cars desiring to sell, or knowing of cars that might be for sale if the owners knew of an opportunity, the company is in a good position to find just the car which is desired by any particular intending purchaser at about the price he wants to pay.

This company has issued a circular calling attention to the nature of its business, and containing three blanks to be detached and forwarded to it by persons who desire to make use of its services. One of these blanks calls for information regarding cars that may be for sale, and an owner of a car can use this card in giving particulars regarding his machine if he desires this company to obtain a purchaser for it. Another card is for furnishing information regarding the kind of a machine desired by some one looking for a second-hand car, and the third blank calls for particulars regarding jobs of overhauling, repairing, or alterations of any kind. When any of these cards are forwarded to the Auto Trade & Repair Co., they promptly take up the case and give the matter very careful attention until the transaction is completed.

R. F. Robertson's Cadillac Agency, Joplin, Mo.

R. F. Robertson of 115 East 5th Street, Joplin, Mo., for the past year has been conducting a very successful agency for the Cadillac cars in that district, and believes that his success is due largely to individual efforts altho he regularly carries advertisements in the three newspapers on Wednesdays and Sundays. He believes in good demonstrations for prospective customers accompanied with sensible talk and no "hot air."

Prospective customers are supplied with catalogs and printed matter which will make them familiar with the principle features of the cars.

Mr. Robertson does not conduct a garage, but does general repair work.

No outside salesmen are employed as Mr. Robertson's experience with outside workers has been that the majority of them simply used the cars, did very little profitable work and were looking for all the graft possible.

Second hand cars are taken in exchange when their condition in his judgement is such that a good profit could be made on them, in fact, he states that in every instance in which cars have been exchanged during the past season, more money was made on the deal than if a new car had been sold outright. A point is made of always keeping on hand a full line for customers to choose from.

W. G. Palmer, in "The Hardware Review," calls attention to the fact that some hardware dealers are taking advantage of the opportunities opened up by the widespread use of motor cars and are stocking up on such sundries. He advocates at least the handling of such types of ordinary hardware used by automobilists and suggests that hardware dealers gradually work into this business more deeply. The goods that are included in the ordinary hardware line and used by automobilists include a full and complete line of nuts and bolts, rubber hose of various kinds, especially small sizes of special quality; copper rivets in a wide variety of sizes for use on brake bands and clutches; special insulated cable for high-tension wiring; copper and brass tubing; jacks suitable for automobile use; special automobile vises; open-end and other suitable wrenches; sheet brass; wire cable suitable for brake connections, etc.; tools of high quality and suitable design; metal polishes; collapsible pails; funnels containing fine sieves, etc.

New Agencies

The Acme car will be represented in the south by the new Acme Motor Car Company of Georgia, located at Savannah.

The Glide will be sold in Minneapolis during the next year by the Ranger Barrett Auto Co., 308 Tenth street S, who have secured the northwestern agency.

The New England agency for the Haynes car has been placed with Mr. Chas. S. Henshaw, who is located at 288 Columbus Ave., Boston, Mass. Mr. Henshaw will represent the Haynes in Boston and the N. E. States.

John S. Johnson, the former champion cyclist and skater, has been appointed Winton sales representative for Minnesota.

Mr. Frederick Phillips, Jacksonville, Fla., has taken on the Franklin line. He will handle the Franklin exclusively.

The Michelin Tire Co. has opened a branch at 2001 Euclid Avenue, Cleveland, Ohio, under the management of R. B. Tracey.

R. E. Graham, Vice President and Sales Manager of the Acme Motor Car Company of Reading, Pa. has just organized the Acme Motor Car Company of San Francisco, which will hereafter act as the general distributor for California of Acme cars.

The Garfield Park Auto Garage, Douglass Blvd. & Harrison St., Chicago, have recently been appointed as agent for the Grout Motor Car.

The 1908 agents of the Nordyke & Marmon Co., Indianapolis, will be as follows:
F. E. Wing Motor Car Co., 12 Columbus avenue, Boston, Mass.; Brazier Auto Works, Thirty-eighth and Market streets, Philadelphia; Snodeal Automobile Co., 2552 Madison avenue, Baltimore, Md.; H. T. Hearsey Vehicle Co., 113 West Market street. Indianapolis; Pennsylvania Auto Co., Hay street and Knight avenue, Wilkinsburg, Pittsburg; C. S. Anthony, 110 East Ninth street, Los Angeles, Cal.; Van Automobile Co.. 1706 Washington avenue, St. Louis, Mo.; Waterloo Automobile Co., Waterloo, N. Y.; Heller-Spawn Motor Car Co., Binghamton, N. Y.; John Ure, Jr., & Co., Milwaukee, Wis., and Rickey Machine Co., 92 Eaton place, East Orange, N. J.

The Hamilton-Kull Company, of 1677 Broadway, New York, in addition to the Aerocar line which it is at present carrying, has arranged for the New York agency for the Oakland car, which is made in Pontiac, Mich., by the Oakland Motor Company.

An agency for the State of Georgia and part of Florida for Acme cars has been placed with the Savannah Automobile Brokers, J. C. Finney, president.

John J. Gibson, of the Buffalo Automobile Exchange, 401 Franklin Street, Buffalo, N. Y., has taken the agency for the Pope-Hartford automobile, and will handle it in connection with the Franklin cars.

C. S. Mack, Schenectady Garage, Schenectady, N. Y., has taken the agency for the Thomas.

Mr. A. W. Davis, Cortland, N. Y., has taken on the Franklin and will also handle the Buick.

T. F. DeBruler & Co., Shawnee, Okla., have opened a show room and repair shop and will handle the Franklin exclusively.

Acme cars will henceforth be sold in New York by Cordner & Flinn, a new metropolitan concern which recently opened salesrooms of imposing appearance at the northeast corner of Broadway and 76th Street. The firm succeeds to the agency formerly held by J. B. Brewster and Company.

Midland cars will be represented in New York by the Allenhurst Garage and Auto Station, 135 W. 37th Street.

George Salzman, for six years Assistant Superintendent of the E. R. Thomas Factory at Buffalo, resigned that position to become Treasurer and General Manager of the American Motor Car Company of Atlanta, Ga., sales agents for the Thomas Flyers. Mr. Salzman's clever driving at the Savannah races led to this change.

Retail Notes

A new selling Company to handle Acme Cars in Southern territory, was recently organized under the style Acme Motor Car Co., of Georgia, with headquarters at Savannah, Georgia. John E. Finney is manager.

Auto Plating and Mfg. Co., Euclid avenue, Cleveland, Ohio, makes a specialty of repairing battered lamps and is doing quite a big business, not only in Cleveland but in the surrounding territory.

Avery Portable Lighting Co., has established a Chicago branch located temporarily at 390 Wabash avenue, and in charge of George D. Armstrong. A Michigan avenue location will be secured as soon as possible.

Akron Pneumatic Tire Co., of Cleveland, Ohio, has opened at 1922 Euclid avenue, an agency for the Akron Pneumatic Tire Co., of Akron, Ohio, maker of a tire protector.

The Bradford Co., of Wilmington, jobbers and retailers, has opened a large building at Delaware Avenue and Tatnall Street, which was altered and improved to meet the Bradford Company's requirements.

City Motor Car Company has been organized at Mt. Vernon, N. Y., with $20,000 capital stock and will operate a garage and deal in supplies.

Jamaica Motor Car Co., of Hillside Branch, Queens county, N. Y., has been incorporated with a capital stock of $1000, by J. A. Jones and F. B. Anderson.

C. H. Letcher, of San Jose, Cal., has opened a garage and is handling the White, Packard and Cadillac cars.

Maxwell-Briscoe Southern Co., has been formed at Atlanta, Georgia, to represent the Maxwell car in that territory. Joseph M. Austin, C. E. Adams and S. C. Austin are the officers.

General Automobile Co, of Boston, has been incorporated to deal in motor cars.

John H. Johnson, formerly a champion cycling racer, who has been assistant to Manager Earl Kiser, of the Pittsburg branch of the Winton Motor Carriage Co., was recently appointed Winton sales representative for Minnesota.

William M. Perrett has given up the management of the Diamond tire branch at Detroit, Mich., and established headquarters at 842 Woodward avenue, where he handles the products of the Empire Auto Tire Co.

L. D. Robbins is now in charge of the motor car agency heretofore conducted by his brother, Alfred N. Robbins, in Boston, who recently quit the motor car trade and identified himself with Porter Fibre Bottle Co., of Lewiston, N. Y.

Raymond-Clark Garage, 940 Jefferson avenue, East Detroit, Mich., has commenced business as agents for White and Northern Cars.

The Schacht Mfg. Co., of Cincinnati, Ohio, recently opened a Chicago office, at 1420 Michigan avenue, under the management of W. S. Crain.

The Studebaker Automobile Co., has opened a branch at 417-423 East Weber avenue, Stockton, California, under the management of Wilbur & Barnett.

Utica Cycle Co., a large dealer in bicycles and automobile supplies, is erecting a new four-story building on a lot at 11-13 Columbia street, Utica, N. Y., exclusively for its own use.

Thomas cars will be handled in Atlanta, Ga,. by the American Motor Car Co., recently formed in that city with George Salzman, formerly assistant superintendent of the E. R. Thomas Motor Co., as treasurer

The West Side Garage recently opened a repair shop at 398 Troup street, Rochester, N. Y., and will soon add a sales department for supplies. Morgan Bodenstein and Chas. I. Bodenstein are the proprietors.

Wilson Automobile Co., of Wichita, Kan., has established branches at Kingman, Pratt and St. John.

Wing Bros., of Tacoma, Wash., are building an additional story to their garage on St. Helens avenue, which is of concrete construction and measures 50x120 feet. The addition will cost $3000.

The H. H. Franklin Mfg. Co., Syracuse, N. Y., has recently established the following agencies: Fruit Oil Co., Sharon, Ohio; E. T. Byram, Galesburg, Ill.; Colonial Motor Car Co., Springfield, Mo.; Salina Automobile Co., Salina, Kansas; Montana Lumber Co., Lewiston, Mont.; E. R. Nelson, Ishpeming, Mich.

Mr. Benj. Gerdelman has recently been appointed the St. Louis representative of the Jones Speedometer Company, and will look after its interests in that City. Mr. Gerdelman will still remain agent for the Witherbee Igniter Company, with whom he has been associated for some years.

THE BRUSH

Runabout

Ran 435 miles on 18 gallons of gasoline

In the Detroit Dealers' Endurance Run

That is 24 miles per gallon, and only the ordinary gasoline, as bought along the route. Over half the course was through mud, often up to the hubs. The only mechanical trouble was one bolt working loose. Not a thing was touched or adjusted, and the motor never missed an explosion, the car finishing in perfect condition, running better than when it started. This was not a special seasoned car, but came down from the assembly room three days before the run started. It ran in the same class with the big fellows up to ten times its price and rated horse power.

Experience of Commercial Motor Car Users

Logan Truck Makes Impressive Demonstration

One of the most remarkable trips undertaken by a commercial motor truck was recently successfully completed by a three-ton model S truck manufactured by the Logan Construction Company, of Chillicothe, Ohio. Arrangements had been made to do some demonstrating with this truck at Cincinnati, Ohio, and it was decided to run the truck overland to Cincinnati loaded, in order to test its capacity and endurance in the most thorough manner.

Arrangements were made with the Sears & Nichols Canning Company, of Chillicothe, Ohio, to carry 100 cases of canned goods to be delivered to the A. Janszen Company, of Cincinnati. These cases weighed 45 lbs. each, making the load 4500 lbs., considerably under the truck's capacity, but still enough to test it over the rough and soft roads which must be traversed.

The truck started from Chillicothe on the afternoon of April 6th and reached Washington Court House at night, having made a distance of 32 miles in about 4 hours, despite the fact that in many places the road was being repaired and great care had to be exercised in going over it. One bad wash-out was also encountered, which was also passed without difficulty.

Some demonstrating was done at Washington and the next day the journey was continued to Dayton in the midst of a pouring rain, which made the roads very slippery. Dayton, 81 miles from Chillicothe, was reached safely, and Wednesday was spent there demonstrating for various firms. The start for Cincinnati was made about 7 o'clock Thursday morning and the 62 miles between that city and Cincinnati were covered in good shape, the truck arriving at the garage of the Cincinati Automobile Company at a little before 6 o'clock Thursday evening.

Not a tool had been touched during the trip, and most of the way had been made on the high gear. Friday morning was spent in showing the truck on the Cincinnati streets, and 1 o'clock Friday afternoon the truck was backed up in front of the wholesale storehouse of the A. Janszen Company and the goods delivered. The Janszen Company showed its appreciation by sending the following letter to the Sears & Nichols Company, of Chillicothe:

"The 100 cases of No. 2 sugar loaf baked beans forwarded to us on auto truck have reached us at 1 P. M. to-day in perfect condition. If it would be possible to have all our goods forwarded in this manner. we would surely highly recommend such deliveries, as it would avoid frequent handling and make deliveries to us in far better shape than those made by rail."

For ten days the Logan model S remained in Cincinnati, we are advised, taking all the hills and doing perfect work throughout day after day without requiring any attention of the mechanic other than oiling up. Perhaps the most remarkable demonstration was for the A. Janszen Company, when a load of 8700 lbs. of miscellaneous groceries, together with five men, were taken up Price Hill, one of the steepest and longest hills in the city.

Uses Cadillac Runabout in Real Estate Business

In his experience with the automobile in the real estate business, Mr. George W. Pettinger, of Asbury Park, N. J., finds the automobile to entirely satisfy his wants and to do all that can be expected. Besides using his car for business purposes he also uses it for pleasure driving, getting lots of pleasure out of it both in driving and in caring for it. His car is a single cylinder, 10 horse-power Cadillac runabout, costing $950. On an average 35 miles are covered per day. Mr. Pettinger has been using this car for the last two years. During last season his average monthly expenses for gasoline, lubricating oil, repairs on machine and tires amounted to $13.50. Last year Mr. Pettinger stored his car at a garage at a cost of $10 per month, but this season he is storing it himself, having recently erected a cement garage with slag roof, 14 ft. x 15 ft. inside, at a cost of $280. Recently Mr. Pettinger overhauled his car, taking it all apart down to every part. Upon examination it was found that the only part necessary to replace, after running the car two years, was a front sprocket and one new piston ring.

nt. of which consists of cork inserts. The vo parts of the shoe are hinged, and are ex-nded by means of a flat cam. They are pported by a cast steel web, the drive being ken from this point to the squared shaft the transmission.

Lubrication is by means of a gear-driven, rce-feed oiler which provides a positive eans of lubricating the piston and connect-g rods. One oil lead terminates at a boss the outside of the cylinder, communicating th a groove $\frac{3}{16}$ inch wide and $\frac{1}{8}$ inch deep the cylinder. For the lubrication of the d end bearings the piston pin is hollow two-irds of its length. A second oil lead registers th this hollow end. The wrist pin is drilled that when the crank is in a vertical position e hole registers with a tube running down e channel of the rod to the large end. This stem has been designed to run with a min-um amount of oil and no waste. Grease is ed to lubricate the crank journals and is fed om cups placed on the dash, the leads con-ting of $\frac{3}{8}$ in. gage copper tubing. Ignition by a storage battery and with Apple Gen-

weight of the car is 2,900 lbs. The chi lists at $2,500. The equipment furni includes two electric side lights, comp set of tools and horn. Any type of body be built to order.

ON THE ROAD.

Recently a trip was made from Deca Ill., to Cincinnati, Ohio with the first Copp truck completed by the concern. Prev to this trip this truck, it is said, travele least 20,000 miles. The distance trav on the trip was 156 $\frac{4}{10}$ miles and the same made in 18 hours running time.

On the first day the car left Decatur at A. M. Feb. 5th, during a downpour of which lasted all day so that the ground covered to the depth of 6 or 7 inches slush of snow and ice. Portland was reac at 3.40 P. M. a distance of 32 miles, with running time of 5 hours, the balance of being consummed by stops along the line to the inclemency of the weather.

Details of the "Coppock" cylinder, showing lowe tainer for water jacket; also finished piston and rings.

The second day the car left Portland 7.30 A. M. and arrived in Richmond at P. M. a distance of 50 miles, the running t being 5 hours 30 minutes. During the sec day of the trip the ground was covered with and the roads were nearly impassable, and in ing over a 450-foot hill the car skidded went over a 12-foot embankment, but a chopping down some trees and a fence it pu itself out again on to the road without assistance. The third day the car star from Richmond at 8.15 A. M. and arrived Cincinnati, at 11 P. M. a distance of 7 miles, in a running time of 7 hours and minutes.

xicab Co., of California, has been organized at Los eles, to provide a motor cab service. Ten machines be placed in commission within 30 days and 15 as soon as possible.

urham and Chapel, N. C., are now connected by an mobile line. The car used carries 30 passengers and es 3 trips per day.

. F. Buchanan, J. A. Street, C. C. Carpenter, J. R. gherty and C. L. Barber, have formed a company operate an automobile line between Tucumcari and rillo, New Mexico.

e Overland Stage Co.'s line between Eureka and San ncisco, Cal., has been purchased by N. H. Pine, G. Noe, F. W. Smyth and W. Dodge, who have nged the style to Overland Auto Company.

of the Locomobile Co., of America, and will be loc at the factory at Bridgeport, Conn. He was form with the Electric Vehicle Co.

W. E. Dolson, of the late Dolson Automobile Co., been appointed assistant sales manager of the A Automobile Co., of Grand Rapids, Mich.

The Harrisburg Taxicab and Baggage Company, of risburg, Pa., has been recently incorporated with a pital stock of $5000.

Hollywood, California, has ordered its second n fire engine, a 15 H. P., 2-cylinder, car, with a 40 lon chemical tank, 800 feet of hose, four sections of der and a full complement of axes, picks and t It accommodates, also, 8 men.

The Federal Taxicab Co., has established a tax service at Washington, D. C., using Thomas Taxi E. R. Thomas is president of the company which is corporated under New Jersey laws, with an autho capital stock of $250,000.

E. P. Blake & Co., are establishing a taxicab se in Boston and expect to have 15 cabs in operation

The Irvington, N. J., fire department, has ordere motor fire apparatus of the Knox Automobile Co. It carry two chemical tanks of 25 gallons capacity 1000 feet of hose and ten men.

So successful financially has the New York Tax Company been that a new 4-story brick garage wil opened on September 1, in West Fifty-seventh Street, tween 11th and 12th Streets on a plot of ground x250 feet. The building will contain the business o repair shop, storehouse, and garage of the company. T will be elevators and runways, and a block signal sy will be used for the cabs. This is the French sys and engineers are now working to perfect it. More 900 machines may be stored in the building. 500 ditional machines were recently ordered.

Norwalk and New London, Ohio, are to be conne by a motor bus line running via Olean and Fitch The line will later be extended to Ashland and Gr wich. Combination buses will be used, accommodatin passengers each besides baggage.

The Pennsylvania Taxicab Co., recently incorpor under New Jersey laws, will soon commence opera 100 taxicabs in Philadelphia.

The Taxie Cab Co., is the name of a new company corporated at Los Angeles, Cal., for the purpose of ope ing a taxicab line in that city.

Three local capitalists of Wilkes-Barre, Chas. N. L land, John Flannigan and T. A. Wright, recently organ a company to operate a bus line. The buses will commodate 16 passengers each.

In view of the difficulties surround the successful operation of motor trucks relatively unskilled hands, it is interest to note that the Oscar Lear Automob Company, Springfield, Ohio, has made Atwater-Kent Spark Generator the sole nition outfit on its vehicles instead of conventional type of coil equipment. T action is explained by the absolute nec sity of the truck performing its duty ste ily and without even "trifling" delays su as the owner of a pleasure car would mind.

MOTOR CYCLE DEPARTMENT

A 1600-Mile Motorcycle Run

A motorcycle event, which for size and importance to the sport has never been equaled in this country, has been planned by the newly organized Western District of the Federation American Motorcyclists. At the end of the National Federation annual meet, which will be held in New York early in July, the Western District members will start for Chicago awheel, and will follow a devious course, taking in all the large cities in the east and middle west. If the present plans are carried out, the trip will cover about 1600 miles, and will take not less than ten days. The finish will be enlivened by a Western District championship meet at a track in or near Chicago. Probably the Harlem or Libertyville track will be chosen. The tour is proposed in order to arouse interest in the two-wheeled vehicle, and to demonstrate its efficiency and reliability under hard highway conditions demanding considerable sustained speed. The idea is said to be favored by the manufacturers generally, and virtually all of the important makes of motorcycles will be represented.

The touring committee of the Western District, F. A. M., under whose management the run will be undertaken, consists of I. F. Alofsin, of Chicago, chairman; Irving R. Hall, John F. Ball, of Milwaukee; W. E. Rheutan, of Aurora; John T. Fisher, Edward A. Thiem, of Minneapolis, and John S. Woodworth. Rules similar to those used on Glidden automobile tours will be drafted for this occasion.

The F. A. M. annual endurance run will be held June 29 and 30 at New York City, and the annual meet during the four days following.

A new motorcycle club has just been formed in New York, called the Concourse Moto-cycle Club. Arthur N. Morse, president; Chas. A. Busch, Vice-President; F. Larsen, Treasurer; W. A. Fischer, Secretary; Maurice P. Sullivan, Captain.

It is said that a physician of Olympia. Washington, is still using a 1900 model motorcycle in making professional calls, the machine being the 21st turned out by its maker. This speaks well for the durability of this construction.

Motorcycle Races at Narragansett Park

Narrangansett Park, one of the finest race tracks in the country, will be the scene Memorial Day of a motorcycle race meet, under the auspices of the Providence Motorcycle Club. A sanction has been granted by the Federation of American Motorcyclists. It is proposed to have the finest list of special events ever held in America, in which the fastest riders in the country will compete and to hang up a string for this meet that will attract motorcyclists from all over the country.

"American" Belts

American Belting & Tanning Co., 135 Oliver street, Boston, Mass., manufacturers of motor cycle belts and leather belting of all kinds, advise us that their customers report best results from 3-ply motor cycle belts as this type of belt does not stretch tho pliable and otherwise thoroly satisfactory. Some of this Company's motor cycle belts it is said have lasted almost 3 seasons, a demonstration of durability that is exceptional.

This Company's V-belt for motorcycles is made with the inside ply smaller than the outer plies, so that there is no compression of the inside plies when the belt is wound around the pulley, thus strains are eliminated which would otherwise result in the rapid deterioration of the belt. All the leather used by this company is tanned by a secret process, which is claimed to make the leather absolutely insoluble and the best French steer hides are used.

Richmond, Virginia, is the latest city to adopt motorcycles for the use of the police department, having recently purchased two "Indians" for this purpose.

A motorcycle pleasure club of one hundred members has been formed in Milwaukee, Wis., and it is claimed that there are not less than one hundred and twenty-five other motorcycles in daily use in that city. Chief Ahern, of Kansas City, has been advocating the formation of a police motorcycle squad for a long time, but he was thwarted last season by oppositon in the ranks of the councilmen.

Hosted by Google

Club and Party Runs Should be Encouraged

The value of ocular demonstrations and their effect on the public is frequently lost sight of. The individual is largely influenced by what the majority of people, or a goodly number of them, do or refrain from doing. This fact is quite noticeable in the season's changes of clothing, particularly at the beginning and ending of the straw hat season. Few individuals have the temerity to act in defiance of custom and most individuals want to do the thing that is popular.

This characteristic of human nature should be taken advantage of more generally than it is in widening the circle of motorcycle users, and this can best be done by working up club and party runs, a popular diversion indulged in by riders of pedal cycles some years ago, and one of the strongest influences in enlisting new riders. The healthfulness of open air exercise, especially rides into the country; the advantage and enjoyment of pleasure gatherings of congenial persons; the educational advantage of touring and all other attractions of cycling, motor cycling and automobiling are well known and readily admitted and it is a good thing to write about the various phases of such pastimes, but the difficulty is to get people to act on the suggestions of the writers who give us such attractive pen pictures of the joys of touring. It is one thing to show people the advantages of some ideal line of action but unless the opportunity is brought right home to them they are likely to agree to these arguments—and forget them. Hence the club or party run of motor cyclists is the most potent force in gathering new riders into the fold. A pedestrian seeing a party of a dozen or more, possibly a hundred, motorcyclists whizzing past him without muscular effort bound for a pleasant day or afternoon in the country will be more forcibly convinced of the advantages of the motor cycle than by reading all the literature in creation on the subject. Devotees of the sport of motorcycling, dealers in motorcycles and even manufacturers should, therefore, do all in their power to work up club runs, or where no clubs exist, party runs so that every community in the country will in time have demonstrated to it in the plainest and most impressive manner the joys and advantages of motor cycling. The manufacturer is of course not in a position to do much toward the development and encouragement of club and party runs, this being essentially a local matter; and the individual rider being concerned more with his own enjoyment of motor cycling than in increasing the sale of motor cycles generally cannot be expected to do much in the matter; hence it rests largely with the dealer and after all he is the most concerned.

Motorcycles Proved their Usefulness in Briarcliff Race

The recent Briarcliff automobile races gave an opportunity for displaying the usefulness and adaptability of the motorcycle to a wide range of work. Motorcycles carried messengers and others quickly and surely to various parts of the course before and during the race and served the purpose much better than 4-wheeled vehicles could have done. The great speed attainable by the motorcycles, their ability to find good paths on almost any kind of a road and to take corners at high speed without danger of overturning are all factors in favor of the use of these machines in such service. At half-past six on the morning of the race a defect in the bridge across Murray's Creek was discovered by one of the motorcycle men, who reported the matter to headquarters and piloted a repair car to the scene. When the wheel of the Maja broke a motorcyclist quickly reported the accident, so that a doctor was promptly dispatched to fix up the wounds of the driver and his mechanic. Two cars were ditched at Kensico and help was quickly brought by the motorcycle squad. Where race officials and others could not be reached by telephone the motorcycle was used in getting important messages to them, and in many similar emergencies the motorcycle proved its dependability and adaptability in the Briarcliff event.

Motorcycles for Chicago Police

Chicago, which up to the present has enjoyed the distinction of being the only large city in the United States that does not own either bicycles or motorcycles for police use, has experienced a change of heart. Chief Shippy has at last decided that the only means of curbing lawless automobilists is by use of motorcycles, and a special force of mounted officers, which will be known as the automobile squad, will shortly be placed on the streets. Chicago automobile dealers have promised the chief to co-operate with him in his campaign against the reckless driver, and President Leinen, of the Chicago Automobile Club, will organize a committee of ten from the leading clubs to aid in the effort to make the city's streets and boulevards safe.

Remarkable Motorcycle Hill Climbs

Speed of sixty-five miles an hour up hill was shown at Danville, Ill., recently in a motorcycle hill climb in which a number of Chicago and Indiana riders competed. The winner, C. W. VanSickle, of Hammond, Ind., climbed Langley Hill, a 1600-ft. rise, in :26½ in one trial and :27¼ in another. Several automobiles competed, but the motorcycle showed more speed than its more powerful rival.

a special gray iron and the cylinder is ored, reamed and ground to accurate size nd to a true and smooth finish. Bushings re all of hard bronze. Shafts, crank n, piston pin and gears are of special eel and are hardened, ground and polhed to a high finish. The connecting d is a drop forging and the crank case made of special nickel-alloyed aluminum. The motor rests in a loop of the frame nd the transmission casing is a part of e frame, very substantial construction eing employed at this point. The chains sed are ¼ x ⅝ pitch roller chains, the speed device being carried on a counteraft. Wheels are 28 inches in diameter; res, 2¼-inch G & J or M. & W. Lurication is by sight-feed oilers feeding to e transmission case and motor. Control in the grips, the right grip controlling e spark and the left operating the throte. The speed change lever works on a ctor attached to the top tube of the ame near the head.

The wheel base is 55 inches. Speed can varied from 6 to 45 miles on the high ar and from zero to 15 miles on the low ar. The weight of the machine is 140 s.; the price $235. Some option is given equipment, high-grade standard goods ing furnished in any case.

ules for Motorcycle Endurance Runs

In planning endurance runs for motorcles, for which sanctions are to be asked om the Federation of American Motorclists, care should be taken to see that e rules of the federation will be comed with. No event will be recognized an endurance run or reliability contest ich is of less distance than 300 miles; which the travel averages less than 150 les per day; in which the course is reated more than once; in which the conls are less than twenty-five miles apart, d in which arrival times at controls e not definitely fixed, or in which more an thirty minutes are allowed as neul time at controls.

he "Bushnell & Cannon" 2-Speed Device

A two-speed and free engine device for otorcycles has just been placed on the rket by Bushnell & Cannon, of 1266-1270 st Eightieth place, Cleveland, Ohio, and here illustrated. The cut shows the de-

of the machine. The increase in the wi of the tread is so small as to be alm a negligible quantity so far as the c fort of the rider is concerned. The wei has been reduced to the minimum c sistent with required strength of part

The gears and pinions are enclosed in oil tight drum, enabling them to be in a bath of lubricating oil, thus do away with the necessity of frequent oil on the part of the rider.

The "Bushnell & Cannon" 2-speed device for Motor Cy

The operation is by means of a sin lever working in a quadrant; when in forward position the machine travels the speed normally obtained through gearing of the sprockets, the reverse sition throws in the low speed, which giv a reduction of 2 to 1; an intermediate sition gives a free engine; all obtained the use of a single lever, and that w but a simple forward or backward mo ment.

W. T. Marsh, of the American Mo Co., recently established a record for m torcycling when he drove one of the M. cycles 100 yards from a standard start 9 seconds. The trial was the result a wager between R. A. Pickens and C

ghts under a patent owned by J. W.
Valters, of Glens Falls, N. Y. Several
ears ago the offer of a prize by the Ger-
an Government for a 2-speed device for
otorcycles led Mr. Walters to design and
atent such a device, but as he has been
lly occupied in other lines and has no
esire to enter the motorcycle trade, he
as not placed his device on the market,
it the very evident and growing demand
r 2-speed motorcycles recently exhibited
this country has lead him to offer the
atent rights to the trade.

Cycle Motor fitted with "Walters" two-speed clutch.
etails of the "Walters" 2-speed clutch for motor cycles.

The Walters 2-speed clutch is of the plan-
tary type of gearing, the intermediary
ears being the driver on the secondary
peed. The operating lever moving the
isk has but ⅛-inch movement to accom-
lish its functions of high speed, neutral
nd slow speed. The proportion of speed
eduction is optional and can be made any
atio from 2 to 1 to any other number
hat the requirements of the use of the

rights to use the idea in motorcycle
struction. as he has use for the des
in other fields.

Standard Sager Toe Clip for Mo

THE EXCELSIOR AUTO CYCLE

A combination of engineering skill and the best of material builded into a motor ycle that is RIGHT and proves it by actual accomplishment on the road.

It marks the triumph of scientific design over the cut-and-try and makeshift nethods that have heretofore obtained in motor cycle construction.

Some of the special features thus developed are:

FREE MOTOR, CORRECT DISTRIBUTION OF WEIGHT, LOW COMFORTABLE SADDLE POSITION, PERFECT SHOCK ABSORBING SPRING FORK, LONG WHEEL BASE, END-LESS BELT TRANSMISSION AND ABSO-LUTELY VIBRATIONLESS MOTOR : : :

The motor is rated at 3¼ H. P., but every one is subjected to a dynamo test and lelivers fully 4 mechanical horse power before passing the inspectors.

Write for our new catalog which gives much valuable information on subjects of eneral interest as well as full description of THE EXCELSIOR AUTO CYCLE.

EXCELSIOR SUPPLY COMPANY

St., New York City, has recently placed the market some new imported motor-cle headlights and separate generators, o of which are herewith illustrated.

Set No. 53A and 53B consists of a beau-ully designed oval headlight, nickel-ted and elegantly finished, and a gen-tor which has a capacity of 1¼ lbs. of bide, and which will suply a ¼ ft. burn-

C. E. Co.'s Motorcycle Lamp and Generator; Set No. 53A and 53B.

from 12 to 14 hours. The headlight is ted with a nickel-plated hood to protect e face of the lamp from rain. The diam-ers of the oval fronts are 5¼ inches and inches, while the depth is 4 inches. e generator is 9 inches high, 3½ inches diameter and weighs 26 ounces. This , complete with bracket and rubber tub-, lists at $10. Set No. 55A and 55B is ry light and compact, and consists of a re front lamp, finished in nickel and hav-nickel fittings. The lamp is 5 inches diameter, 4½ inches in depth and ighs 12 ounces. The generator holds half pound of carbide and will supply

M. C. E. Co.'s Motorcycle Lamp No. 55A

capacity of ¾ lbs. of carbide and will s ply gas to a ¼ ft. burner from 8 to hours. The weight of the generator is ounces, and it is 6½ inches high by 2 inches in diameter. The price complete $8.00.

Peckham Motorcycle Grips

O. T. Peckham, 87-89 Sixth street, Gra Rapids, Mich., well known as a maker bicycle handle bar grips, includes in line a number of styles for motorcycle u and reports that its motorcycle trade increasing very rapidly. One of its le ing motorcycle grips is style 66, which made of the best leather thongs glu and wrapped on a wood core. The ca and ferrules are brass, nickle plat Style 68 is another very popular han bar grip and has a solid hard maple co wrapped with leather thongs, the cap a ferrule ends being of wood and integ with the core. These ends are given natural finish and highly polished.

Peckham Style 75 Leather and Wood Grip.

Style No. 74 is the same in construct as No. 68, but is given a different fini The cap and ferrule ends, while being wood and part of the core, as in style are stained in imitation of a wound leat used in the center of the grip and giv a high polish. Style 75 grip is also si ilar in construction to 68, but the ferr end is fitted with a brass nickel pla ferrule. The cap end, instead of havi a natural finish, is stained in imitation leather and highly polished. All Pe ham grips are packed in boxes of 12 pa each, making the stock very easily hand by jobbers. Any of these styles of gr are furnished for ¾, 13-16, ⅞ or 1-in handle bars.

A new motorcycle organization has be founded in Boston, known as the Massac setts Motor Club. Its first road meet w from Copley Square, Boston, to Walth Weston, Sudbury, Marlboro, Shrewsbu Worcester, Framingham and home.

HENDEE MANUFACTURING CO. SPRINGFIELD

E OR FORE CAR FOR ROUGH ROADS?

Laredo, Tex.

your opinion is the Side or Fore car i-car) the most satisfactory motorcycle chment for hilly and very sandy roads n not wider than wagon tracks, with a erous sprinkling of gullies and stumps.

he side car does not seem to have enough ibility to negotiate road depressions satctorily but has the advantage of a changegauge, while a Fore or Tri-car seems to e the desired flexibility but on a narrow l will run in ruts not to mention stumps ch the driving wheel may encounter and ch, owing to narrow road and deep ruts cannot dodge.—GUS BECKER.

rom my experience on some Texas roads ould recommend neither tri-car or foreattachment for motorcycles. To be sure as produces everything under the sun that be named, even in the road line; from the st level McAdam and shell surfaces, to vilest sand, mud, rut, hump and stump glomeration that man can conceive.

answering your question broadly I would there is not much choice between the two chments named. The tri-car has the adtage in appearance and in the steering, for the driver does not have to learn to st this as he does a side car, which is apt to a little tricky until accustomed to it. T side-car is lighter, cheaper and may be ma adjustable to the road track. In either ca a good road clearance is necessary for I fou frequently on these roads, tree stumps, lar stones, and a high crowning centre betwe the wheel tracks. It would be useless to e pect an ordinary motorcycle to drag alo anything except a single rider in Texas any long tours are anticipated. You are su to strike some districts where riding is ne to impossible even with the single machi on which one is able to dodge from side side, taking a narrow path which might ridable, and frequently dodging trees a stumps. This is the charm of the motorcy even when you are compelled to sandwich a mile or two occasionally of trundli through some especially bad places. But such things become a curse when more th the light single track machine is used.

I have penetrated into districts of Tex where the chug, chug of the motor never b fore has been heard and many another d will pass before the two track machine w be able to enter.—C. H. M.

oit, Mich., and have been designed for use ith either gasoline or kerosene for fuel. hey are made in single, double and quad-ıple-cylinder forms in horsepowers of 4-6, 9, 14-18 and 35, the single cylinder mo-rs being made in two sizes, 4x4 and 5x5, hile the two and four-cylinder forms have x5 cylinders. One of the main features f the Yale is the mechanical by-pass hich, it is claimed prevents base firing nd four-cycling while giving a wider range f control. It is said that this motor can e run at 2000 r. p. m. and immediately owed down to 150 r. p. m. without miss-ıg an explosion. There are no working arts in the mechanical by-pass and it andles kerosene vapor as well as gaso-ne.

The exhaust manifold of Yale engines water jacketed, all cylinders are cast f best gray Scotch semi-steel. The water ıcket gives ⅞-inch of water space the ntire distance around and extends 3 ıches below the exhaust port. All parts

Starboard view "Yale" Single-Cylinder marine engine, owing the exhaust manifold water overflow which is st fast to the cylinder and is carried to the bottom of e boat. This cut also shows the ample length of the arings, and the lubricating system.

f the Yale motors are ground, bored and nished to jigs, so that any part can be eplaced without cutting or fitting. The pis-

connection with their water circulat pumps. The pump is of the high press plunger type and is so arranged that small spray nozzle (furnished for $3 tra) can be attached so that the overf of water can be used for washing the b

Rear View "Yale" single-cylinder, marine engine, ing the eccentric commutator and the mechanical by

or used for extinguishing a fire. A buretor is fitted to the company's own sign. Altho the engine is regularly eq with jump spark ignition, the make break system can be furnished for $ extra. The prices of the Yale motors as follows: 4 to 6 H. P. equipt for fr water $110.00, salt water $117.00. 7 t H. P., fresh water $150.00, salt water $ 35 H. P. fresh water $700.00, salt w $340. 35 H. P. fresh water $700.00, salt w $745.00. These prices include the en complete ready to run and everyth necessary to install in a boat, namely, peller wheel, bronze stuffing box, sh coupling, batteries, spark plug, swi wire and muffler.

General Kimball, Supt. of the Federal Saving Service, states in his annual re that by the use of gasoline motor boats persons were saved from drowning. Se

lding a line of 4-cycle, 2 and 4-cylinder posed marine motors, from 2 to 50 horse-ver. The main claim of the manufac-er is that nothing has been left undone ich would tend to make the engine bet-, more serviceable or more durable.

all" 4-Cylinder Opposed Marine Motor; Front View.

e Hall 4-cylinder motor is herewith wn in front and end views. Special ention has been paid to the accessibility the motor. By removing four cap ews, which are located in a very con-ient place, the whole top part of the nk case can be lifted off and the oper-r can easily get at the inside of the tor. All moving parts are protected m grit and dirt, and all parts are en-sed perfectly tight in the cylinder and nk case castings and run in a bath of All valves are mechanically operated. rication is effected by means of a sight l oiler. A special carbureter of the t feed type is fitted, which the manu-turers state will work exceptionably l in zero weather.

ll" 4-Cylinder Opposed Marine Motor; End View.

ll Hall motors are fitted with gover-s. One great advantage of the gover-is that in making landings the clutch be thrown in and out without paying attention to the engine; when the ch is thrown out, which relieves the ine of its load, the governor automati-y reduces the amount of gas taken into

This valve was designed by the G. Essex Brass Co., 480-86 Franklin stre Detroit, Mich., to meet the demands fo simple and practical mixing device two-cycle motors.

The body of the valve is cast in t sections, and is held together by fo screws, making it possible to examine t disc and valve seats, and regrind them necessary. The disc is specially design to make it light, and the port area is a increased in order to minimize the lift. T throttle can be manipulated to get a speed desired instantly, and held in t position by a ratchet cast on the body.

The "Acme" Mixer Valve.

In the cut A is shown the lever whi operates the throttle, which is located the outlet passage to control the supply gas to the motor. The lever is held at d ferent points desired by means of t ratchet cast on the valve body. B indicat the valve to regulate the flow of gasolin and C is the gasoline supply connectio This mixer valve is made in six sizes, follows: ½ inch, $4.50; ¾ inch, $5.50; inch, $6.50; 1¼ inch, $7.75, 1½ inch, $9. and 2 inches, $19.60.

The "Thomas" Air Compressor

The Thomas air compressor is design to pump compressed air into a stora tank to supply the whistle used on mot boats and launches. The compressor operated by means of a belt and pull driven from the propeller shaft or ca shaft of the engine. Metal packing rin are used to insure perfect compressio The bore of the cylinder is 1 13-16 in and the stroke is 2½ inches. The leng of the piston is 2¾ inches. The manuf turers guarantee the compressor to mai

Hosted by Google

pon the size of the tank used. A ten-allon tank is large enough for most cases, et the size of the boat and whistle used hould be taken into consideration. The eight of the compressor is 18 lbs. About ne-third horse power is required to pump s maximum pressure. The compressor

The "Thomas" Air Compressor.

manufactured by W. K. Thomas, 1876 roadway, New York City, and lists at 5.00 without pulley and at $16.50 with lley. With pulley and belt tightener the ice is $17.50, and with clutch pulley, 0.00.

Mr. Thomas also furnishes whistles, nks and gauges at the following prices: histle, with valve No. 6, $3.25, and with lve No. 14, $4.00; 10-gallon tank, $6.00; -gallon tank, $7.00; pressure gauges, on case, brass rings. $2.75; brass case d beveled glass, $3.50, and nickle case d beveled glass, $3.75.

The "Sailors' Gauge"

In addition to its line of automobile soline tank gauges the Emergency Wheel Novelty Company, 625 Huron avenue,

Float Cable, etc., of the "Sailors' Gauge."

"Walter" Propeller Shaft Stuffing Boxes, Ball Hangers and Skegs

Glens Falls Mfg. Co. of Glens Falls, N. Y. has brought out a ball stuffing box for propeller shafts the object of the device being to do away with the necessity of a shaft log, prevent binding and friction, add to the strength of the keel and allow the shaft to be placed at any desired angle. The "Walter" construction while offering these various advantages is said to be cheaper than the use of a shaft log and stuffing box. This elimination of the shaft log is a great advantage in motor boats especially racers in which lightness is an object. This construction also allows the use of a lighter keel.

Longitudinal Section of a Boat keel and propeller s haft showing application of the "Walter" Ball Stuffing Box.

A ball hanger for supporting the propeller is also furnished as shown in one of the cuts herewith and a skeg can also be furnished if desired. No rebabbiting of the hanger bearing is necessary as a new ball is put in when it become worn, making a new bearing which is of bronze and therefore durable. The ball can be replaced easily by the amateur. The ball hanger is separate from the skeg but the latter is easily attached to the hanger. The hanger and skeg are both illustrated herewith. The hanger is adjustable to any pitch of shaft, any width of boat and any diameter propeller.

The "Walter" Ball Hanger for Propeller Shafts and the "Walter" skeg.

Simplicity Reverse Gear

The Simplicity reverse mechanism is of the miter gear type, the gears being made of the best obtainable grade of steel for this purpose. In this reverse gear the gears are only used on the reverse and in the neutral position and are always in mesh. The forward drive is direct and is obtained by the use of an expanding ring, which, when in use, causes the entire drum holding the gears to revolve, acting as an auxiliary fly wheel. The wear of this band is slight, but the provision is made for taking it up by an adjusting screw on the expanding arm, the screw being very accessible and always in view. Reverse is obtained by compressing an iron band around the gear case, this band being controlled by a cam movement, which in turn gets its motion by the movement of the cone on the main shaft. The arm conveying the movement of the cam has a screw adjustment similar to the adjustment of the direct drive expanding ring. The entire internal mechanism runs in oil, and as the casing is oil tight the matter of lubrication requires attention only about once or twice a season.

Three sizes of this gear are made, transmitting, respectively, 1-6 H. P., 6-12 H. P., and 12-20 H. P. No. 1 weighs approximately 28 pounds, and lists at $15; No. 2, 33 pounds, list $26; No. 3, 55 pounds, list $45. The main dimensions of No. 1 are

Simplicity Reverse Gear, Sectional View.

15½ inches over all length, 6⅝ inches over all heighth, 5 11-16 inches diameter of casing. The shaft is 1⅛ inches in diameter. No. 2 gear is 17 inches over all length by 7¼ inches in heighth, and 6⅝ inches diameter of casing, while No. 3 is 20½ inches long, 9 inches high and 7⅞ inches diameter of casing. The shaft of No. 2 is 1⅜ inches in diameter, and of No. 3 1⅝ inches. These gears can be obtained from the Simplicity Gear Co., Detroit, Mich

A reorganization of the Sales and Engineering Departments of the Brown-Cochran Company, of Lorain, Ohio, has been effected, and Wm. M. Maxwell is now general sales manager. J. O. Brown, president of the company, who heretofore had charge of the Sales Department, is now devoting his entire attention to the executive affairs of the company. C. I. Longnecker, M. E., has been appointed chief engineer of the company.

for in connection with a gasoline launch. The operator has absolute control over the speed of his boat, and this, without touching any part of the engine, or making any change in mixture or valves. In my opinion no gasolene launch should be without one of these propellers, as it adds much to their value and convenience."

GEO. L. WILLARD, Sunapee, N. H.

The ROPER Safety Propeller

What It Does and How It Does It

SIMPLEST, most practical and the **ONLY SAFETY PROPELLER.** Gives positive and instant control from absolute stop to full speed in either direction. Easily operated by one simple lever without resort to throttle or spark. Consists of two pairs of blades which revolve constantly at a substantially uniform speed in the same direction, regardless of speed or direction of the boat. These blades may be so adjusted that one pair will reinforce or counteract the effect of the other pair without changing load on engine, thus producing results that have never been

equaled by any other device. Perfect motor boat control.

Fully explained in our new and beautifully

Refined Motor

3 H. P.

but developing as much power as other motors rated 4 H. P. **Bore 1½ inch; stroke 3½ inch; turning a 12-inch propeller, 17 pitch, 200 to 800 revolutions a minute.** Weight 50 lbs. Reliability, strength, simplicity, power and durability. **Only four movable parts.** Exclusive float feed carburettor. No valves, springs, triggers, cams, gears, gaskets, nor packing requiring attention.

No Cranking All bearings bronze bushed. Crank shaft hardened and ground. Cylinder, piston and rings ground. Spun copper water jacket. Pumps from bilge and sea-cock.

on the Rim That Saves Tim

The Goodyear Detachable Auto-Tire is constructed of the best rubber and fabric, by our own exclusive process, which makes it the longest-lived tire on the market. It can't creep—can't rim-cut—and is 90 per cent puncture proof. That's why it saves you money. With the Goodyear Universal Rim you can take the tire off—or put it on—in less than 60 seconds by the watch, and you won't need any tools but a small wrench and your fingers. This picture makes clear the simple operation. To get the tire off, loosen nut "D" with an ordinary small wrench—push valve stem "E" up into tire—press flange ring "B" against tire—pull off locking ring "A"—slide of flange ring "B" and then the tire. It goes back just as quickly and easily. And when your tire is on this rim it stays on no matter where, or how hard you drive. The Goodyear Universal Rim takes any standard clincher tire, as well as the detachable.

applied to Ford cars, Models "N" and "R."

As will be seen, it comprises a pair of bevel gears, casing for the same, a vertical shaft, on top of whi is mounted a STERLING DOUBLE CONTAC timer.

This vertical timer obviates all the disadvantag of the timer in its present inaccessible position whe it is also subject to dust and grease, and it is givi universal satisfaction.

The application is extremely simple, no machi work being required except the drilling and tapping two ¼-inch holes in the cylinder.

Everything is furnished in the outfit except the wi for wiring up. The material and workmanship is fir class, and the outfit is guaranteed in every particular.

The STERLING DOUBLE CONTAC TIMER, used on this device has a number of no features, and is positively the best on the market.

Write for descriptive circular and prices.

Diamond Chains

for they are strictly a quality product.

Every real improvement in chain construction appeared first in Diamond Chains, and we spare no effort or expense to maintain a high standard of material and workmanship. Take for instance, our nickel steel rivets, which have never been equaled for resisting wear and breakage, our chrome nickel side bars, which increase the tensile strength, altho they make a lighter chain, and our new built-up block which, because of its added rivet-bearing surface, will pull enormous loads without unreasonable wear.

Diamond Chains represent 18 years' experience concentrated exclusively on chain transmission problems, and have long been the acknowledged standard.

The new Diamond Repair Block makes repairing easier on a riveted chain than on a detachable chain.

A TEST OF PRINCIPLE AND QUALITY

Probably one of the hardest tests an Automobile has ever been put to, has been met by the American entry, A THOMAS FLYER, in the New York to Paris Contest. The front wheels of this car are fitted with **Timken Roller Bearings,** the hardest service on a car for bearings—but up to the present time has given no trouble or needed any attention.

E. R. Thomas Motor Co., Buffalo:

Gentlemen:—It gives me great pleasure to inform you that the TIMKEN ROLLER BEARINGS which were used on the Thomas Flyer, which is America's entry in the International Race from New York to Paris, gave no trouble whatsoever from New York to Cheyenne, where I had charge of the car. I also believe that they have given no trouble since. These bearings, as you know, are placed where the greatest strain is on them, and it is a considerable pleasure to inform you, that I believe the high quality of workmanship and material in your bearings is such, that they must be able to stand up under any and all road conditions, as the strain placed upon them, and in fact the entire mechanism of the Thomas car in this race were most extraordinary, and probably the hardest strain that could be put upon any motor vehicle, either under ordinary or extraordinary circumstances. The highest praise that I can give your bearings is, that I believe that they are fit component parts for the Thomas Flyer.

Yours very truly,
MONTAGUE ROBERTS

TIMKEN ROLLER BEARINGS

are made to use on all roads, rough or smooth, and represent a special knowledge of load and tractive requirements, with a wearing quality impossible with any other form of frictionless bearings. And that is why over 60 per cent. of all the high grade American Automobiles and 95 per cent. of the Trucks made in this Country recognize **The Timken Principle Correct and The Timken Quality Supreme.**

If you are building Automobiles or Trucks we would like to furnish you some data, based on facts that will not only interest you, but save you money.

The New Terminal Clip Handle of the BREECH-BLOCK SPARK PLUG

DO YOU USE Breech-Block Plugs?

Then, by all means, you should have one of these handles. "The most convenient thing ever devised," you will say after using it. It is made of enameled wood, impervious to heat, and is a non-conductor, thus preventing burns and shocks.

The handle is inserted in the clip in place of cable. The regular cable clip is attached to the Breech-Block clip with a small brass screw and nut, which are furnished with each plug. With the cable thus attached to the clip at right angles, the clip is easily removed from the plug. The handle is an insulator and is very convenient for testing the spark by detaching clip from plug and forming a spark gap.

Better order one,—**NOW.**

NOTE THE FOLLOWING TESTIMONIAL:

Wallingford, Conn., April 29, '08

Brennan Mfg. Co.,
Syracuse, New York.
Gentlemen:—

The two cylinder engine which I purchased of you last month I have now run 500 or 600 miles and am delighted with it. I think it is the strongest, best hill climbing two cylinder machine there is on the market and would be glad to write you a testimonial concerning what I have been able to do with it, if it would be of any use to you.

I have done some great stunts with it.

Yours,
Henry Stone,
Wallingford, Conn.

BRENNAN STANDARDS have for years been the choice of the well-informed because of their quiet-running qualities, their flexibility, economy and efficiency. They will give **you** the best service you have ever secured from any motor, irrespective of cost. We furnish them complete, mounted on sub-frame, to fit all standard makes of cars such as Aerocar, Olds, Pope Hartford, Cadillac, Wayne, Queen, Ford, Marion, etc.

DOES

75 per cent of the labor of the driver.

Carries your car through sand and mud and over rough roads without any effort of the driver and takes all the jar from steering wheel.

Holds machine steady and straight so that driver need use one hand only and take off both hands when desirable.

Causes a machine to drive so easily a man with one arm can run an automobile with safety.

Causes the parts of a machine, including the tires, to wear longer.

Prevents accidents in case the steering gear becomes disabled, tire bursts or spring breaks.

Fits all Autos.

The great safety of this device pays for it each time used.

Guaranteed to prove satisfactory or money refunded.

PREMIER

"The Quality Car"

¶ Good design, high class material, honest workma
ship; dependability—characteristic of the Premier—
the qualities which enabled it to defeat many of its hig
priced competitors in the 1907 Glidden Tour, and sec
a perfect score—the only car in its class within $1200
its price to receive this award.

¶ These qualities also enabled it to defeat ***all of***
competitors for the world's non-stop record by o
1300 miles.

¶ They enabled it to make the round trip betw
Boston and New York ***in a day*** (the only car ever to
so) and this with bonnet and high speed lever sea
in place.

¶ These are the qualities necessary for long life of a c
low cost of maintenance and the highest degree
satisfaction.

¶ Let us tell you more about it in our handsome catalog
